How much does illness and lost time cost you?

KEX FLOOR PLAN PACKAGE —SERVICED BY RENTEX— IS EFFECTIVE AGAINST INFECTIOUS GERMS!

Read this Important News Now: — The U.S. Dept. of Agriculture has accepted the following claims for KEX Services:

- "KEX" Walk-Off-Mats are chemically treated with an anti-microbial additive to inhibit the growth and spread of environmental bacteria in a mat and to reduce contamination in the areas serviced by Walk-Off-Mats.
- "KEX" Walk-Off-Mats are effective against Staph Aureus.
- "KEX" Walk-Off-Mats reduce populations of air and dust-borne Staph Aureus in the areas serviced by Walk-Off-Mats.
- "KEX" Walk-Off-Mats reduce the introduction of bacterial populations in rooms serviced by Walk-Off-Mats.

Help clean the air for you and your employees. Let your Rentex Service expert show you how to minimize air borne bacteria with KEX Services. Act Now — TODAY! Call CE. 3-5700.

BSP® DISPOSABLE UNIT

HW&D BRAND OF SODIUM SULFOBROMOPHTHALEIN INJECTION, USP

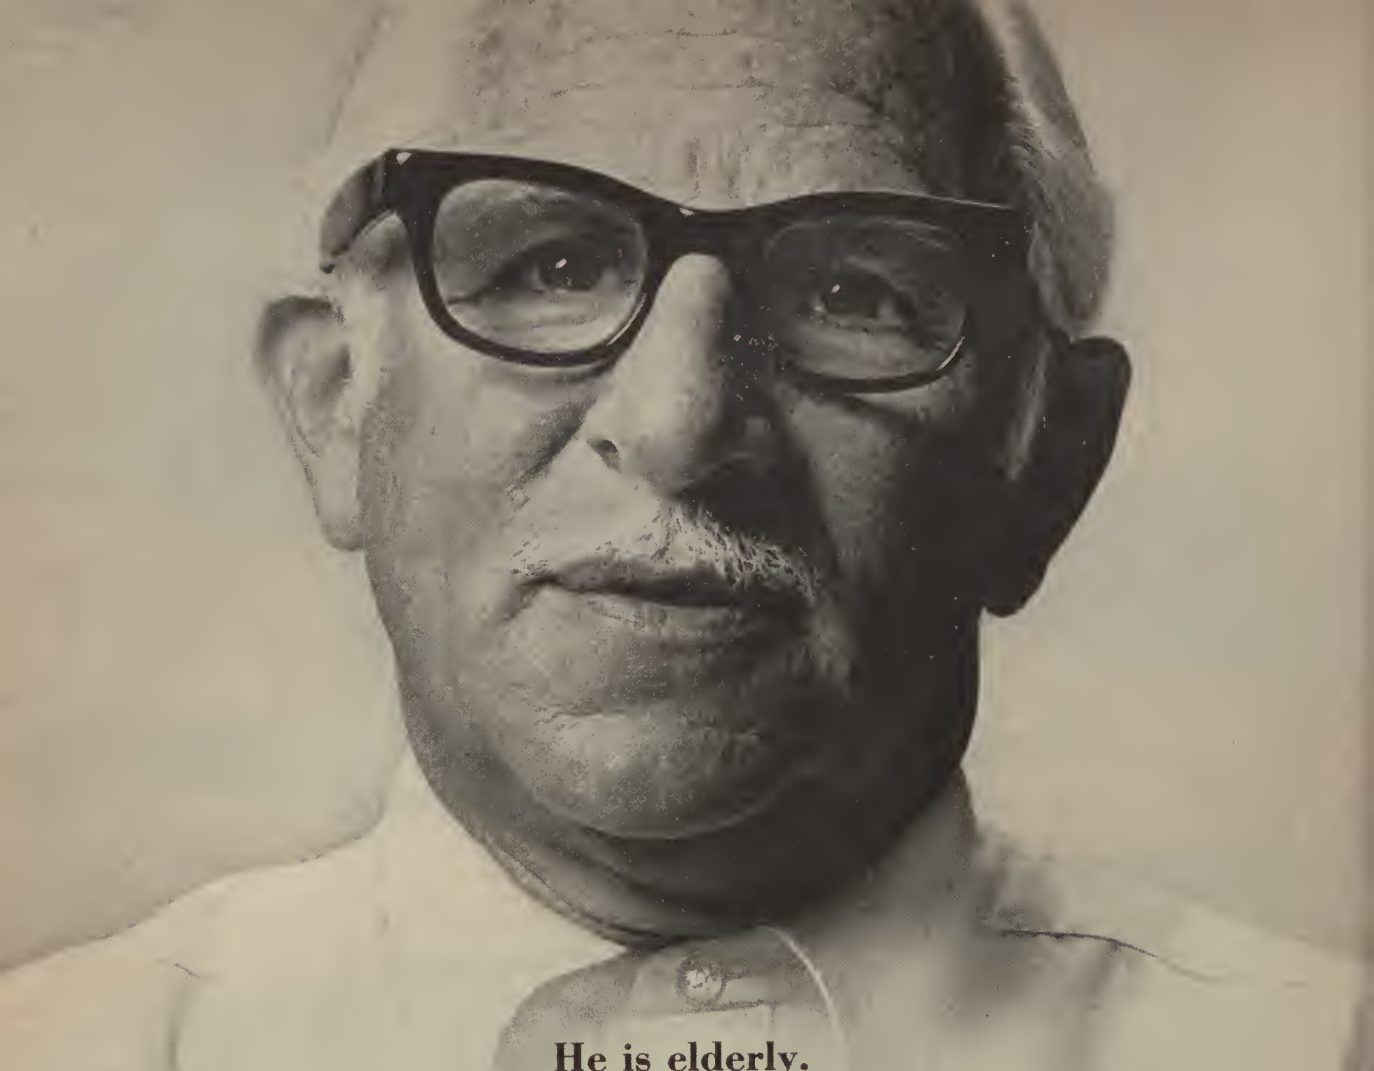
(50 mg. per ml.)

BROMSULPHALEIN® IN A STERILE, DISPOSABLE, ECONOMICAL UNIT

The Bromsulphalein test is a convenient, sensitive, reliable test of liver function.

The precalibrated syringe contained in the BSP Disposable Unit makes weight calculations unnecessary, providing proper dosage regardless of patient-weight. Each unit contains complete directions for use, precautions and contraindications.

The all-inclusive BSP Disposable Unit provides economic unit dispensing.



Complete literature available on request.

he may be a candidate for

DECLOSTATIN® 300

Demethylchlortetracycline HCl 300 mg
and Nystatin 500,000 units
CAPSULE-SHAPED TABLETS Lederle

b.i.d.

To guard susceptible patients against intestinal monilial overgrowth during broad-spectrum therapy—the protection of nystatin is combined with demethylchlortetracycline in DECLOSTATIN.

For your susceptible candidates, prescribe DECLOSTATIN—the broad-spectrum therapy that prevents monilial overgrowth.

Effectiveness: Because its antibacterial component is DECLOMYCIN Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, Nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes: a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

CONTENTS:

Editorial—The Commission on Medical Discipline, John Sargeant . . . 65

Introduction—Legal Aspects of Malpractice Suits As They Affect the Practice of Medicine, Judge George D. Solter, Howard F. Kinnamon, MD 66

Malpractice from the Private Practice and Institutional Psychiatric Viewpoint, John M. Hamilton, MD 69

"There was a time when all of the fears and concerns about physician malpractice could be conveniently stored in the stock phraseology learned by every medical student in a course possibly labeled "Medical Jurisprudence 101." Malpractice has subsequently become a much more complex area of concern."

Perfection of Standards, and Informed Consent in Preventing Malpractice Suits, Paul E. Huffington, MD 75

"To illustrate the impact of medico-legal decisions on the practice of medicine, I can think of no more vivid case than one tried a decade ago in Ireland. The plaintiff was given a spinal anesthetic for surgery. Subsequently, there was temporary residual neurological damage to the bowel and bladder. The plaintiff sued and recovered. Since that case, virtually no spinal anesthesia has been given in Ireland. In Ireland, the anesthesiologist feels that he hasn't a fair chance with the law."

The Implications of Malpractice Suits, B. Martin Middleton, MD 78

"This is an age of progress, an age of hope. It is an exciting time. But, one of the fundamental problems that faces our society today is our inability to put technological advances on a par with human advances, and, as a result, we are faced with the problems of medical malpractice."

Malpractice Implications and the Safeguards in Maryland's Law, Judge W. Albert Menchine 81

"What appears to be a major problem in discussing the issue of malpractice suits against a physician is the question of whether or not the physician is presented with an accurate picture of the law that governs and controls this litigation."

Suits Against Physicians for Professional Negligence from the Defendant's Point of View, John F. King, Esquire 84

"It is the suit that is irreparably damaging to the physician and to this, that is the mere filing, there is absolutely no defense. This defenselessness to injury is one which physicians do not believe the Bar by-and-large fully appreciates."

The Need for Medico-Legal Cooperation in Treating Malpractice Suits, Joseph I. Pines, Esquire 88

"The problems of medical malpractice are deep-rooted. Physicians are of the impression that patients and lawyers do not understand that a bad result does not automatically mean that a malpractice suit is in order. Lawyers are similarly unhappy because they claim that they cannot get the cooperation and assistance from the medical profession which they need to properly represent their clients."

DUES BILLS IN MAIL

Dues bills for 1970 have been mailed to all Faculty members. Payment of dues must be received by January 31, 1970 in order for a physician to be eligible for legal defense in the event an action for professional liability is filed against him. A recent Bylaws change by act of special session of the House of Delegates on December 13 clearly spells out this benefit of membership and the provisions that must be met.

Independent panels are selected for the purpose of judging the merits of any legal action for professional liability. In the event a claim is ajudged to be unfounded, expert medical witnesses will be provided for the defendent if the case goes to court.

REORGANIZATION OF NURSING HOME GROUP

The 21-year old Nursing Home Association has been reorganized into the Health Facilities Association of Maryland. The change took place at the organization's annual meeting held in Baltimore on December 8.

The new Health Facilities Association of Maryland embraces all types of health care facilities, including extended care, skilled care, intermediate care; multi-level, non-profit, public and chain-operated facilities.

William R. Greco, MD, of Prince George's County, has been named Treasurer of the group.

PHYSICIANS NOW ELIGIBLE FOR SOCIAL SECURITY BENEFITS

Physicians, who were placed under the Social Security system in 1965, have now contributed to the system long enough to be eligible for some benefits.

While the maximum amount self-employed persons pay into the system has increased from $259.20 in 1965, to $538.20 in 1969; benefits also have been increased over the same period.

COMMITTEE ACTIVITY CONTINUES

As 1969 drew to a close, the Faculty's Committee on Emotional Health continued its investigation into the problems involved in the lack of psychiatric facilities for emotionally disturbed children; transportation of

COMMITTEE ACTIVITY CONTINUES (cont'd)

psychiatric patients to mental institutions; and the treatment of emotional ills of individuals over age 18 without parental consent.

During a recent visit to Baltimore, Joseph Baker, MD, of the AMA's Council on Mental Health, commented that Maryland has well-developed programs (and is much further ahead than most states) in the fields of alcoholism control and drug abuse treatment.

The new Pre-School Hearing and Vision Screening Board has been established. Physicians on the board include Karl M. Green, Cyrus L. Blanchard, Richard E. Hoover, Arnall Patz and Margaret L. Sherrard. Other board members are Miss Harriet Haskins and Mrs. Mary Jane Ellen.

The Board will supervise pre-school vision and hearing screening of four year olds.

The Faculty's Annual Sportsmedicine Seminar was held early in December at the Catonsville Community College. The program, attended by over 200 persons, received considerable publicity including a full-page layout in the Catonsville Times devoted to the presentations of the speakers. The event was cosponsored by the Athletic Department of the community college.

The college is presently offering a noncredit course on the Prevention and Care of Athletic Injuries. The curriculum has been approved by the Faculty.

Be on the lookout for the first issue of The Assemblyman, the legislative newsletter of the Faculty. The General Assembly convenes on January 21, 1970, for it its regular 70-day session. Since 1970 is an election year, it is not anticipated that many controversial pieces of legislature will be adopted.

The Faculty's committee on Postgraduate Education, Preventive Medicine and Public Health conducted a symposium on viral diseases in November. Nearly 200 people attended the event held in Osler Hall.

Be on the lookout next month for a summary of Maryland's Medicaid program, payment basis and other pertinent information.

Achrocidin® Tablets and Syrup

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen Citrate 25 mg.

ACHROCIDIN Tetracycline HCl—Antihistamine—Analgesic Compound Tablets and Syrup are recommended for the treatment of tetracycline-sensitive bacterial infection which may complicate vasomotor rhinitis, sinusitis and other allergic diseases of the upper respiratory tract, and for the concomitant symptomatic relief of headache and nasal congestion. For children and elderly patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN Tetracycline equivalent to Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15 mg.

Contraindications: Hypersensitivity to any component.

Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.

Precautions: Drowsiness, anorexia, slight gastric distress can occur. In excessive drowsiness, consider longer dosage intervals. Persons on full dosage should not operate vehicles. Nonsusceptible organisms may overgrow; treat superinfection appropriately. Treat beta-hemolytic streptococcal infections at least 10 days to help prevent rheumatic fever or acute glomerulonephritis. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).

Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity reactions*—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage.

Upon adverse reaction, stop medication and treat appropriately.

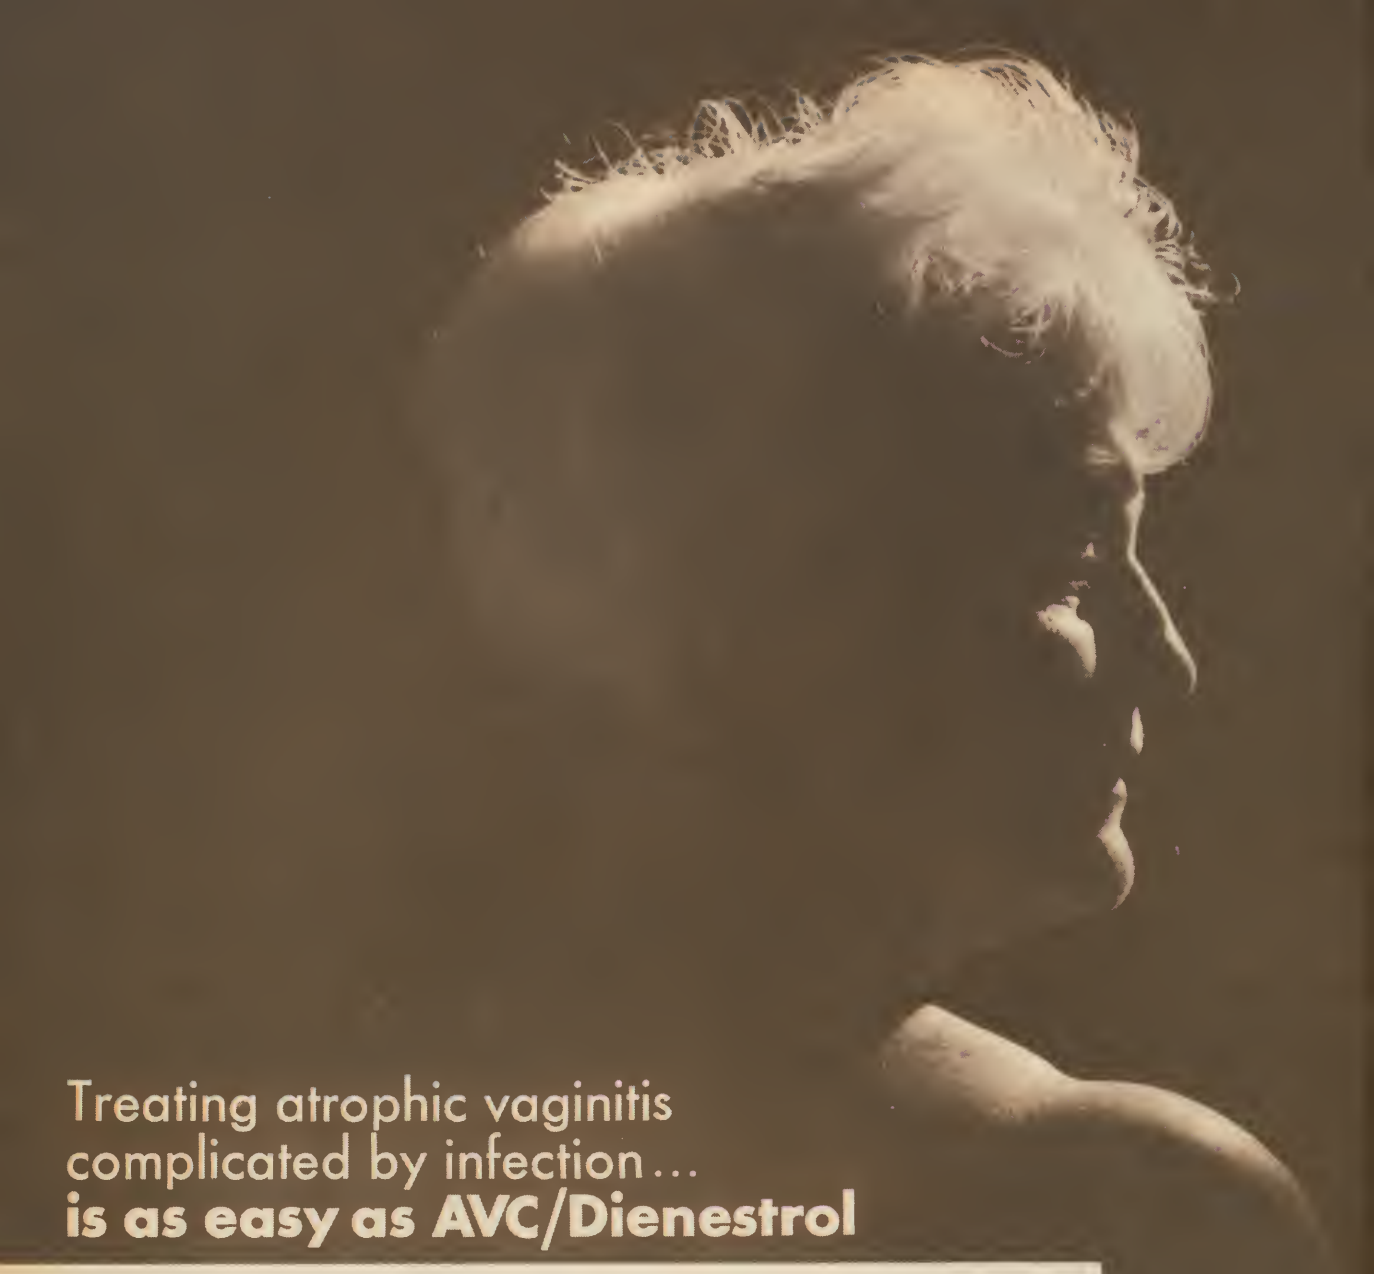
Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD



One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.

Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

THE NATIONAL DRUG COMPANY
DIVISION OF RICHARDSON-MERRELL INC.
PHILADELPHIA, PENNSYLVANIA 19144

Quinamm™
(quinine sulfate 260 mg., ominophylline 195 mg.)

Specific therapy for night leg cramps

Treating atrophic vaginitis complicated by infection... **is as easy as AVC/Dienestrol**

Dienestrol helps restore estrogen-deficient vaginal mucosa.
It is the *particular* ingredient in AVC/Dienestrol that improves cell maturation counts[1,2] — helps stimulate the restoration of normal vaginal epithelium to resist infection.

Two recent studies reconfirm AVC/Dienestrol efficacy.[1,2] AVC/Dienestrol is proven effective against monilial, trichomonal, nonspecific bacterial vaginitis, and mixed infections.[1,2] AVC/Dienestrol combats infection, helps restore tissue resistance to reinfection.

So even in complex cases, the treatment can remain the same. Comprehensive. Effective. Easy as AVC/D.

Contraindications: Known sensitivity to sulfonamides; diagnosis or familial history of carcinoma of the genital tract or breasts; precarcinomatous lesions of the vagina or vulva; palpable uterine fibromyoma; mammary fibroadenoma; depressed liver function.

Precautions/Adverse Reactions: The usual precautions for topical and systemic sulfonamides should be observed because of the possibility of absorption. Burning, increased local discomfort, skin rash, urticaria or other manifestations of sulfonamide toxicity or sensitivity are reasons to discontinue treatment. The use of AVC/Dienestrol does not preclude the necessity for careful diagnostic measures to eliminate the possibility of neoplasia of the vulva or vagina. Manifestations of excessive estrogenic stimulation through dienestrol absorption may occur. These include uterine bleeding, breast tenderness, exacerbation of menstrual irregularity and provocation of serious bleeding in women sterilized because of endometriosis. Endometrial withdrawal bleeding may occur if use is suddenly discontinued.

Dosage: One applicatorful or one suppository intravaginally once or twice daily.

Supplied: 'AVC/Dienestrol Cream'—Four ounce tube *with* applicator. 'AVC' and 'AVC/Dienestrol Suppositories'—Box of 12 *with* applicator.

SSA Letter No. 372 Affects Residency Training

The publication of Intermediary Letter #372 by the Bureau of Health Insurance of the Social Security Administration pertaining to Part B Payments for services of supervising physicians in a teaching setting has created great concern, particularly among those responsible for residency training programs.

On June 17, 1969, Dr. C. Rollins Hanlon, Director-Elect of the American College of Surgeons, arranged a preliminary meeting with Mr. Arthur Ness, Deputy Commissioner of the Social Security Administration, Mr. Thomas N. Tierney, Director of the Bureau of Health Insurance of the SSA, and Mr. Robert G. Hoyer, Chief of the Health Services Branch, Division of Policy and Standards of the Bureau of Health Insurance. At this meeting, Dr. Hanlon expressed the deep concern of ACS regarding the impact of this directive on surgical training programs, with particular emphasis on the probable decrease in opportunities for senior resident responsibility.

As a result of this initial meeting, Dr. Hanlon, and Dr. Robert M. Zollinger, Chairman of the Surgical Services Committee, were invited to attend a meeting of consultants at the Social Security Headquarters in Baltimore on July 10, 1969. This meeting was called "to obtain a better and more uniform understanding among carriers, providers and physicians of the conditions under which payment may be made under Part B for services rendered to patients by supervising physicians in the teaching setting and the method for determining the reasonable charge which may be recognized for such services."

In addition to the representatives from ACS, there was a broad spectrum of representation from the American health community, including the medical assistance programs, group health insurance programs, the American Hospital Association, and others.

The officials of the SSA expressed the deep concern of Congress regarding problems which had

arisen with the Medicare program, particularly the excessive costs reported from some hospitals in a teaching setting. Special attention was directed to the problems of establishing and administering these federally-assisted health programs in large city hospitals, which traditionally have been concerned with the care of indigent patients.

It has been difficult to develop a single policy embracing both community hospitals, where there is practically no intern or resident staff, and large medical centers, where much of the medical care for all patients is effected by interns and residents in training. The medical center hospitals, "in a teaching setting," constitute a relatively small proportion of the total number of hospitals; nevertheless, they provided much of the health care offered to indigent patients until Titles 18 and 19 of the amended Social Security Act of 1965 were signed into law.

Particular concern was expressed as to how Part B payments might be made "in a teaching setting" when the staff physicians supervising the care of private as well as indigent patients were already salaried by the hospital or university for their administrative and teaching responsibilities, which include supervising the work of the resident staff. There was no widespread recognition of the distinction between staff physicians salaried by a hospital and those salaried by a medical school independent of their patient-care activities in a hospital.

During the interchange of ideas, it became abundantly clear that there is a wide variety of methods used by teaching services in complying with the concept of "supervision"; and all such approaches were freely discussed by those present. There is NO question regarding payment if the surgeon treats the patient as a private patient, performs the operation himself, and carries out all the usual functions connected with preoperative, postoperative and follow-up care. The question on which a decision remains to be made is: Will it be possible to make charges under Part B for patients operated upon by a resident in training, even in the presence of the supervising staff physician, as it has been in the past, if the guidelines published on February 8, 1967, in the *Federal Register** are conscientiously observed?

We anticipate that by the time this report is published, new and different requirements may be in effect. The recurrent theme of "double payment" under Part A for services of those in training, and under Part B for services of those supervising the training, may be altered by changes or reinterpretation of existing legislation. However, it is essential that all chiefs of service as well as the junior and senior members of their staffs be thoroughly familiar with Intermediary Letter #372. The necessity of detailed notations in the chart preoperatively, postoperatively and when the patient is discharged must be emphasized.

It is hoped that additional meetings will be held between representatives of the Social Security Administration and the American College of Surgeons. These challenging problems do not permit an easy interpretation or solution. Any decision which involves federally-supported insurance programs could shortly involve various forms of commercial insurance, and this could leave our residency training programs deficient in opportunities to provide residents senior responsibility. The continuing obligation of the American College of Surgeons is to ensure high quality surgical care for the American public. This must rest on the assurance that educational programs for surgeons will include operative experience adequate in amount, high in quality and with sufficient autonomy for maturing surgeons to permit the development of sound surgical judgment by the time they enter the independent practice of surgery.

*For a copy of the relevant section of the *Federal Register,* Vol. 32, No. 26, February 8, 1967, and Intermediary Letter #372, write to Surgical Services Committee, American College of Surgeons, 55 E. Erie St., Chicago, Ill. 60611.

"All Otolaryngologists are Alike"

Just look at them and you can see how much they have in common. Besides, they all go through pretty much the same training, and pass the same kinds of tests, and measure up to the same sort of standards. Therefore, all otolaryngologists are alike. Right?

Wrong! But that's no more preposterous than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

Bayer's standards are far more exacting. In fact, there are at least nine *specific differences* involving moisture content, purity, potency and speed of tablet disintegration, which make the manufacture of Bayer® Aspirin so different.

These Bayer standards result in significant product benefits, including gentleness to the stomach and product stability, that enable Bayer Aspirin tablets to *stay* strong and gentle until they are taken.

So next time you hear someone say that *all* aspirin tablets are alike, you can say, with confidence, that "it just isn't so."

You might also say that all otolaryngologists aren't alike, either.

symptoms of mixed anxiety-depression are rarely clear-cut...
but they are often a clear indication for

Mellaril®
(thioridazine)
25 mg. t.i.d.

effective in mixed anxiety-depression and in moderate to severe anxiety

Before prescribing or administering, see Sandoz literature for full product information, including adverse reactions reported with phenothiazines. The following is a brief precautionary statement.

Contraindications: Severe central nervous system depression, comatose states from any cause, hypertensive or hypotensive heart disease of extreme degree.

Warnings: Administer cautiously to patients who have previously exhibited a hypersensitivity reaction (e.g., blood dyscrasias, jaundice) to phenothiazines. Phenothiazines are capable of potentiating central nervous system depressants (e.g., anesthetics, opiates, alcohol, etc.) as well as atropine and phosphorus insecticides. During pregnancy, administer only when necessary.

Precautions: There have been infrequent reports of leukopenia and/or agranulocytosis and convulsive seizures. In epileptic patients, anticonvulsant medication should also be maintained. Pigmentary retinopathy may be avoided by remaining within the recommended limits of dosage. Administer cautiously to patients participating in activities requiring complete mental alertness (e.g., driving). Orthostatic hypotension is more common in females than in males. Do not use epinephrine in treating drug-induced hypotension. Daily doses in excess of 300 mg. should be used only in severe neuropsychiatric conditions.

Adverse Reactions: *Central Nervous System*—Drowsiness, especially with large doses, early in treatment; infrequently, pseudoparkinsonism and other extrapyramidal symptoms; nocturnal confusion, hyperactivity, lethargy, psychotic reactions, restlessness, and headache. *Autonomic Nervous System*—Dryness of mouth, blurred vision, constipation, nausea, vomiting, diarrhea, nasal stuffiness, and pallor. *Endocrine System*—Galactorrhea, breast engorgement, amenorrhea, inhibition of ejaculation, and peripheral edema. *Skin*—Dermatitis and skin eruptions of the urticarial type, photosensitivity. *Cardiovascular System*—Changes in the terminal portion of the electrocardiogram have been observed in some patients receiving the phenothiazine tranquilizers, including Mellaril (thioridazine). While there is no evidence at present that these changes are in any way precursors of any significant disturbance of cardiac rhythm, several sudden and unexpected deaths apparently due to cardiac arrest have occurred in patients previously showing electrocardiographic changes. The use of periodic electrocardiograms has been proposed but would appear to be of questionable value as a predictive device. *Other*—A single case described as parotid swelling.

SANDOZ PHARMACEUTICALS, HANOVER, N.J. SANDOZ 69-384

Man in space, now fait accompli, re-emphasizes the importance of Uro-Phosphate therapy. Research into the effect of space travel on the astronaut reveals that weightlessness causes loss of bone calcium. As the bones are required to bear less and less of the weight of the body they lose calcium, increasing the calcium content of the urine. When physical activity is reduced, the acidity of the urine should be adjusted to keep increased calcium in solution . . . . a prophylaxis to prevent kidney or bladder calculi.

Uro-Phosphate®

NOW A SUGAR-COATED TABLET

Each tablet contains: METHENAMINE, 300 mg.; SODIUM ACID PHOSPHATE, 500 mg.

Uro-Phosphate gives comfort and protection when inactivity causes discomfort in the urinary function. It keeps calcium in solution, preventing calculi; it maintains clear, acid, sterile urine; it encourages complete voiding and lessens frequency when residual urine is present.

Uro-Phosphate contains sodium acid phosphate, a natural urinary acidifier. This component is fortified with methenamine which is inert until it reaches the acid urinary bladder. In this environment it releases a mild antiseptic keeping the urine sterile.

Uro-Phosphate is safe for continuous use. There are no contra-indications other than acidosis. It can be given in sufficient amount to keep the urine clear, acid and sterile. A heavy sugar coating protects its potency.

Dosage:

For protection of the inactive patient 1 or 2 tablets every 4 to 6 hours is usually sufficient to keep the urine clear, acid and sterile.

2 tablets on retiring will keep residual urine acid and sterile, contributing to comfort and rest.

A clinical supply will be sent to physicians and hospitals on request.

heavenly relief
for unearthly cough

Benylin®
EXPECTORANT

Each fluidounce contains: 80 mg. Benadryl® (diphenhydramine hydrochloride, Parke-Davis); 12 grains ammonium chloride; 5 grains sodium citrate; 2 grains chloroform; 1/10 grain menthol; and 5% alcohol.

An antitussive and expectorant for control of coughs due to colds or of allergic origin, BENYLIN EXPECTORANT is the leading cough preparation of its kind. BENYLIN EXPECTORANT tends to inhibit cough reflex... soothes irritated throat membranes. And its not-too-sweet, pleasant raspberry flavor makes BENYLIN EXPECTORANT easy to take.

PRECAUTIONS: Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this preparation. Hypnotics, sedatives, or tranquilizers if used with BENYLIN EXPECTORANT should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing BENYLIN EXPECTORANT.

ADVERSE REACTIONS: Side reactions may affect the nervous, gastrointestinal, and cardiovascular systems. Drowsiness, dizziness, dryness of the mouth, nausea, nervousness, palpitation, and blurring of vision have been reported. Allergic reactions may occur.

PACKAGING: Bottles of 4 oz., 16 oz., and 1 gal.

THE COST OF **AMBAR EXTENTABS** IS APPROXIMATELY ONE HALF THAT OF OTHER LEADING APPETITE SUPPRESSANTS

AN IMPORTANT FACTOR IN LONG TERM THERAPY

CONTROL FOOD AND MOOD ALL DAY LONG WITH A SINGLE MORNING DOSE

AMBAR #2 EXTENTABS®

methamphetamine HCl 15 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

One Ambar Extentab before breakfast can help control most patients' appetite for up to 12 hours. Methamphetamine, the appetite suppressant, gently elevates mood and helps overcome dieting frustrations. Phenobarbital, the sedative in Ambar, controls irritability and anxiety...helps maintain a state of mental calm and equanimity. Both work together to ease the tensions that erode the willpower during periods of dieting.

Also available: Ambar #1 Extentabs®—methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

BRIEF SUMMARY/**Indications:** Ambar suppresses appetite and helps offset emotional reactions to dieting. **Contraindications:** Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. **Precautions:** Administer with caution in the presence of cardiovascular disease or hypertension. **Side Effects:** Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. See package insert for further details.

Baltimore City Medical Society

Meeting Notes

The Board of Directors of the Baltimore City Medical Society met at 4:30 PM on November 4, 1969, at 1211 Cathedral Street, Baltimore, Maryland. The meeting was called to order by Raymond C. V. Robinson, MD, President.

The minutes of the October 14, 1969 meeting were read and approved.

The problem of acceptance and support of the proposals put forth by the "Man Alive Program" for the maintenance of addicts on methadone while in the city jail was again considered. It was decided that since the State Medical Society is presently considering the problem of methadone treatment, and the Federal Narcotics Bureau is formulating guidelines for such programs as "Man Alive," it would be premature for the City Society to make any further statement on this matter.

The Board agreed to purchase a caduceus emblem for the new Health Sciences building at the Community College of Baltimore. This will be placed on the outside of the building and carry a placard designating the origin of the gift.

A proposal was approved that the members of the Board each serve a three-month term on the Professional Relations Committee, and as chairman the third month.

Dates for the 1970 Board meetings were presented and approved. These meetings will be held the second Tuesday of each month, except during June and December when the meetings will be held the first Tuesday.

Old business included the continued discussion of a professional relations problem concerning two physicians who recently dissolved an association. The problem presented to the Board concerned ownership of patient records. The Board decided that the physicians involved should discuss the legal questions concerning the association with their respective attorneys and that the Board would rule only on the problems of ethics.

Vincent R. Blake, MD, joined the meeting at this time and informed those present of a proposal for a comprehensive medical care plan being formulated by "MUND" (Model Urban Neighborhood Development). This proposal would provide medical care for residents in the MUND area (located around Greenmount Avenue and 25th Street) on a prepay basis. This will affect the practicing physicians in the area and it was surprising to members of the Board that no knowledge of this program was available until this date.

At the same time, the Board discussed the present Hopkins' Plan for prepaid comprehensive medical care. This plan has been submitted to the Federal Government for funding and was never presented to the Society.

After much discussion, it was agreed that the Society must become more involved in the problems of the practicing physicians in the inner-city, and in order to do this, must be informed of the proposals being made by groups such as MUND and Hopkins. It was suggested and approved that a proposal be made at the next general meeting of the Society which would amend the Bylaws so as to allow the Commissionner of Health of Baltimore city to be a conference member of the Board of Directors. It is hoped that by having the Commissioner attend the meetings of the Board, the Society will be kept aware of plans as they are being developed and the Health Department will know the feelings of the practicing physician as voiced through the Society.

There was no further business, and the meeting was adjourned at 6:30 PM.

The Baltimore County Medical Association

The October meeting of the Baltimore County Medical Association at the Sparrows Point Country Club, on Saturday, October 25, 1969, was called to order by the President, Theodore Patterson, MD, who welcomed the wives and guests who were present. The minutes of the September meeting were approved as read. The Treasurer, John Krager, MD, reported a total of $21,208.24 in the treasury.

Barbara Solomon, MD, the association representative to the Council on Smoking, requested volunteers to set up a Smoking Withdrawal Clinic, starting early next year.

Four new members were admitted to active membership.

The speaker for the meeting was Mr. John Sargeant, Executive Secretary of the Medical and Chirurgical Faculty. He outlined several bills of interest to physicians which will probably be introduced in the state legislature.

After the business meeting was adjourned, a dinner-dance took place.

The November meeting of the Baltimore County Medical Association was held at St. Joseph Hospital on November 15, 1969, at the invitation of the Sisters of St. Francis and the hospital staff. The meeting started with a luncheon at 1:00 PM. The business meeting followed, under the direction of the Vice-President, Wilmer L. Gallager, MD. The minutes of the previous meeting were approved. The report of the Board of Governors was read by the Chairman, S. J. Venable, Jr., MD. The nominating committee announced the slate for the coming election; no further nominations were made from the floor. The Secretary, John Krager, MD, read the communications that were received. At the conclusion of the business meeting, Dr. Gallager turned the meeting over to Eugene Riley, MD, President of the Medical Staff of St. Joseph Hospital, who introduced the speakers for the Shock Seminar.

The first paper, "Management of Shock in Surgical Practice" was given by Robert B. Rutherford, MD, Associate Professor of Medicine at Johns Hopkins. Paul K. Hanashiro, MD, Assistant Professor of Medicine and Surgery at the University of Maryland School of Medicine, presented the second paper, entitled "Cardiogenic Shock." The final paper, "Coagulopathies in Shock," was given by Safum Attar, MD, Associate Professor of Thoracic and Cardiovascular Surgery at the University of Maryland School of Medicine. A question and answer period followed each presentation.

The meeting adjourned at 5:00 PM. Dr. Gallager thanked the Sisters of St. Francis and Dr. Riley and the Program Committee members for the excellent luncheon and scientific program. After the adjournment, the Woman's Auxiliary to the Baltimore County Medical Association hosted a cocktail party for the members of the Association and staff of St. Joseph Hospital and their wives.

Ninth Semiannual Meeting of the Maryland Association of Medical Assistants

The Maryland Association of Medical Assistants held their ninth semiannual meeting in Ocean City, Maryland, on September 6, 1969. The business meeting was followed by a panel discussion narrated by Mrs. Dolly Stuck. Members of the panel included: Mrs. Dorothy Hartel, President, Baltimore Association of Medical Assistants; Mrs. Mabel Young, Allegany-Garrett Medical Assistants; Mrs. Frances Whittaker, President, Montgomery County Association of Medical Assistants; and Mrs. Doris Ward, President, Wicomico Association of Medical Assistants. The panel reviewed the problems and purposes of each local organization. A question and answer period followed the discussion and included opinions designed to better the state organization.

Dr. Todd

In the afternoon, Nevins Todd, MD, of Salisbury, Maryland, spoke on "Carcinoma of the Lung", giving many pertinent statistics relating cigarette smoking to lung cancer. Dr. Todd was born in Salisbury, and was graduated from Wicomico High School. He attended Syracuse University and received his MD degree from the University of Maryland School of Medicine in 1957. He completed his internship at the University of Maryland Hospital, and served with the U.S. Navy from 1958 to 1960. Upon completion of his general surgical residency at the University of Maryland Hospital, he served a two-year thoracic surgical residency at the same hospital. Dr. Todd was certified by the American Board of Surgery in February 1968, and he is presently in private practice as a thoracic surgeon in Salisbury, Maryland.

Mr. Whedbee

The events of the day were climaxed by a gala evening at the Ship's Cafe in Ocean City. Master of Ceremonies for the evening was Mr. Thomas G. Whedbee, Jr., Director of Church Home and Hospital in Baltimore. A native of North Carolina, Mr. Whedbee attended Wake Forest University, and, after serving with the U.S. Navy for four years, graduated from the Medical College of Virginia in 1960. That same year, he came to Church Home and Hospital as Assistant Director, and was appointed Director in 1965.

Following the dinner, members of the Baltimore Association of Medical Assistants presented "Laugh-Out, Smash-In". The medical assistants and guests thoroughly enjoyed the lighthearted entertainment presented by Mr. John Allen, Mrs. Dorothy Hartel, Mrs. Elva Edmonston, Mrs. Peggy Bury, Mrs. Mary Margaret Frederick, Mrs. Barbara Daniel, Mrs. William Leiby, and Miss Carmella Sartori.

NOW
A NEW CONCEPT
in
BOOKKEEPING
and
TAX SERVICES

This Service, used by hundreds of Professional men in Maryland, is proof that we save time and money for you.

WHAT YOU DO —

Maintain a checkbook—one which we have especially designed for Physicians

WHAT WE DO —

—we prepare MONTHLY STATEMENTS of Income and Expense

—we prepare QUARTERLY AND FINAL PAYROLL RETURNS

—we prepare and adjust QUARTERLY DECLARATIONS OF ESTIMATED TAXES

—we prepare STATE AND FEDERAL INCOME TAXES, ready for signature

—we prepare a CONFIDENTIAL COST ANALYSIS

—we relieve you of the burden of BOOKKEEPING AND TAXES and leave you free to practice medicine.

MEDIC
1970 SCHEDULE

JANUARY 30, 1970 — 12:30 PM

PORTAL CIRRHOSIS

George Zuidema, MD
Professor of Surgery
The Johns Hopkins University School of Medicine

The major life-threatening complication of hepatic cirrhosis is hemorrhage from gastroesophageal varices. Precise diagnosis and aggressive primary care are essential in successful patient management. Although many methods have been employed, emergency portacaval anastomosis remains the best method for control of variceal hemorrhage and definitive treatment of portal hypertension. Portal decompression also has a role in control of intractable cirrhotic ascites.

Sponsor: PROVIDENT HOSPITAL

Replays:	Monday, February 2, 1970	12:30 PM
	Wednesday, February 4, 1970	9:00 AM
		2:00 PM

FEBRUARY 6, 1970 — 12:30 PM

MENINGITIS

Fred McCrumb, MD
Professor of International Diseases
University of Maryland School of Medicine

Acute microbial disease of the central nervous system is manifested most frequently as the clinical syndrome of meningitis. A broad spectrum of bacterial and viral agents may be involved. Varied and specific identification, pathogenesis, and clinical management will be discussed.

Sponsor: SACRED HEART HOSPITAL

Replays:	Monday, February 9, 1970	12:30 PM

THE MONTH IN WASHINGTON

A Senate subcommittee said that the number of medical malpractice suits probably will increase and "the situation threatens to become a national crisis."

Sen. Abraham Ribicoff (D., Conn.), chairman of the Subcommittee on Executive Reorganization which has been reviewing the federal role in the nation's health care problems for nearly two years, reported eight conclusions of an extensive staff study. They are:

"1. The number of malpractice suits and claims is rising sharply in certain regions of the country. The size of judgments and settlements is increasing rapidly.

"2. Most malpractice suits are the direct result of injuries suffered by patients during medical treatment or surgery. The majority have proved justifiable. These suits are the indirect result of a deterioration of the traditional physician-patient relationship.

"3. The publicity given to higher malpractice judgments and settlements, based frequently on new legal precedents, is likely to trigger increasing litigation in other states. The situation threatens to become a national crisis.

"4. Already, higher judgments and settlements are having the following direct results:

(a) Companies providing malpractice insurance are increasing the cost of coverage.

(b) These costs—in the form of higher charges—are being passed on to patients, their health care insurance companies, and federal health care programs.

"5. The rising number of malpractice suits is forcing physicians to practice what they call defensive medicine, viewing each patient as a potential malpractice claimant. Physicians often order excessive diagnostic procedures for patients, thereby increasing the cost of care. Moreover, they are declining to perform other procedures, which in themselves, may entail some risk of patient injury.

"6. At present, it appears that no one affected by the rise in malpractice suits and claims has been able to deal with this problem in a manner that promises to alleviate this situation.

"7. The lion's share of the total cost to the insurance companies of malpractice suits and claims goes to the legal community.

"8. There is a definite federal role in the malpractice problem."

Specialists listed as having "a greater potential exposure to malpractice suits" were orthopedic surgeons, general surgeons, neurosurgeons, anesthesiologists, obstetricians and gynecologists.

The 1150-page report included responses from staff inquiries to the American Medical Association, the American Hospital Association, lawyers and malpractice insurance companies.

If the situation continues to worsen, the report said, the federal government "may have to consider . . . a reinsurance pool to which it would contribute."

If the federal government moves into the malpractice area, the report said, it also should consider:

". . . whether medical or surgical injury to a patient is a community responsibility and therefore compensable by the community.

". . . whether it must provide legal aid to the poor to help them seek redress from personal medical or surgical injury.

". . . whether it will insist upon creation of more effective regulatory devices over health professionals and health facilities to assure that those who are providing care are competent to do so."

* * * *

A special task force recommended that the federal government experiment with different ways of paying physicians under medicare and medicaid.

In the first of a series of reports on medicaid, the task force —appointed by Health, Education and Welfare Secretary Robert H. Finch last July—said:

"HEW should actively program experiments for incentive reimbursement under medicare and medicaid, with new emphasis on experiments in payment methods for physicians as the key generators of health services. In addition to experiments in institutional reimbursement, other experiments could emphasize compensation to groups of practitioners using modified approaches to capitation with built-in controls on quality and costs."

The report said that states also should be made aware of options now available under present laws and regulations in addition to the individual fee-for-service basis for payments to physicians. The report listed "contract payments with quality controls, case average methods, and fee for time."

The task force recommended that medicaid funds be used to finance group practice, neighborhood health clinics and home health care programs, particularly in ghettos and other low-income areas.

The recommendation was the core of a goal "to effect changes and improvements in the health care delivery system" of the nation.

"Bringing about needed major changes in the organization and delivery of health services is a long-range objective, requiring national commitment and establishment of national policy and priorities," the task force said in the first of a series of reports.

"For the short range, we are recommending certain actions which could bring about some improvements and which are consistent with long-range objectives."

For the short range, it was recommended that 5% of federal medicaid funds be earmarked for state "development and improvement of health care services and resources." Consideration also should be given to such use of medicare funds, the report said.

The federal government was urged to take a more positive leadership role in the medicare program by first improving its own administrative machinery and then getting each state to make its management functions more efficient.

Other recommendations of the task force included:

• Deny federal medicaid funds to chiropractors and naturopaths; • Require uniform provisions and unified state standard setting, certification, and consultation functions with respect to providers of service under both medicaid and medicare; • Establish eligibility for medicaid benefits by permitting an applicant to fill out a simple declaration form; • Require "profiles at the state level of vendors and recipients of service, and criteria against which to screen claims to identify patterns which appear to deviate from desirable and/or usual behavior."

* * * *

The American Medical Association urged Congress to give top priority to appropriations that will help increase the number of physicians.

Testifying before a Senate appropriations subcommittee, **C. H. William Ruhe, MD,** director of the AMA's Division of Medical Education, said that "medical education should be supported financially as fully as possible to meet the pressing need which exists today for an increased number of physicians.

"We believe," he said, "that in any appropriation priorities established for all government programs, those which affect health care should be given primary consideration. Further, because of the special need . . . for more physicians, we urge that appropriations relevant to the production of physicians be given first priority."

Concerning decreases in the Administration budget in support of research and training grants, fellowships, library grants and research facility construction, the AMA spokesman said:

"It is difficult to estimate the effect these reductions will have upon efforts to increase physician production, but there is concern among many medical educators that the growth in medical school enrollments will be inhibited. We believe that this effect should be watched closely and corrective measures instituted promptly if physician production is impaired."

The AMA joined the Student American Medical Association and the Association of American Medical Colleges in a joint statement which said that "an increase in the appropriation for the Health Professions Student Loan Program is crucial."

Physicians May be Bound to Disclose Credit Terms

Under the Federal Truth in Lending Act, which became effective July 1, 1969, a physician may be required to disclose, on statements sent to patients, the amount and terms of credit arrangements concerning his fees. Regulations issued under the Act apply not only to finance charges, but also to express agreements for payment of medical fees in more than four installments, either with or without finance charges. Detailed information on the regulations may be obtained from the nearest Federal Trade Commission office or by mail from the agency's headquarters, Washington, D.C. 20580. The information is contained in a booklet entitled "What You Ought To Know About Truth in Lending Consumer Credit Cost Disclosure," Federal Reserve Regulation Z.

Professional Liability Insurance

A recent news story on medical liability rates in southern California received wide circulation nationally. The story stated that the average annual premium for 7,000 Los Angeles County physicians is $5,000.

Costs associated with malpractice are having an effect on medical costs, prompting some California physicians to increase fees for office calls by $1 per call. A place for arbitration of malpractice claims by a malpractice board is being considered by some physicians and hospital boards there. Legal issues are raised by such a plan, not to mention possible adverse effects on the physician-patient relationship.

Reportedly, malpractice insurance rates have gone up three times faster than the cost of living since World War II. Even so, annual losses on this type of business have been recorded by insurance carriers since 1959.

The following table lists current annual premiums for professional liability insurance available to ACOG Fellows for a representative coverage. The rates given are for solo practice; for a partnership add 20%* to the solo rate to determine each partner's premium.

Fellows seeking additional information or application forms may write the American College of Obstetricians and Gynecologists, 79 West Monroe Street, Chicago, Illinois 60603.

BURROUGHS WELLCOME & CO. (U.S.A.) INC.
Tuckahoe, N.Y.

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently. Large doses of the alka formulation are contraindicated in glaucoma.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Persistent or severe dyspepsia may indicate peptic ulcer; perform upper gastrointestinal x-ray diagnostic tests if drug is continued. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with caution in the first trimester of pregnancy and in patients with thyroid disease.

Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. Patients should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage occur. Make complete blood counts at weekly intervals during early therapy and at 2-week intervals thereafter. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The more common are nausea and edema. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. The patient should be instructed to take doses immediately before or after meals or with milk to minimize gastric upset. Drug rash occasionally occurs. If it does, promptly discontinue the drug. Agranulocytosis, exfoliative derma

Sandy sails again!
After an arthritic flare-up.

His rheumatoid arthritis flared out of aspirin control.
It meant weeks of pain, stiffness,
swelling and tenderness...and a lot of sun and wind that
somebody else took advantage of.

Next time, after aspirin, consider Butazolidin alka:
prompt anti-inflammatory effectiveness
short trial period
low maintenance dosage
usual dosage: 1 capsule q.i.d. initially, then 1 or 2 daily

Butazolidin® alka

100 mg. phenylbutazone
100 mg. dried aluminum hydroxide gel
150 mg. magnesium trisilicate

Serious side effects can occur. Select patients carefully (particularly the elderly) and follow them closely in line with the drug's precautions, warnings and contraindications. Read the prescribing information. It's summarized below.

Stevens-Johnson syndrome, 's syndrome (toxic necrotizing ermolysis), or a generalized gic reaction similar to serum ness may occur and require anent withdrawal of medica- Agranulocytosis can occur enly in spite of regular, repeated nal white counts. Stomatitis rarely, salivary gland enlarge- may require cessation of treat- t. Such patients should not ve subsequent courses of the . Vomiting, vertigo and languor occur. Leukemia and leukemoid ions have been reported. While definitely attributable to the , a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, hypersensitivity angiitis, pericarditis and several cases of anuria, glomerulonephritis and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Rheumatoid Arthritis: Initial: 3 to 6 capsules daily in 3 or 4 equal doses. Trial period: 1 week. Maintenance dosage should not exceed 4 capsules daily; response is often achieved with 1 or 2 capsules daily. In selecting the appropriate dosage in any specific case, consideration should be given to the patient's weight, general health, age and any other factors influencing drug response. (B)46-070-C

For complete details, please see full prescribing information.

If it doesn't work in a week, forget it.

Remember how grea milk of magnesia tasted?

Almost as good as castor oil.

But now you can spare the taste buds and spoil the patient with a modern Dulcolax tablet or suppository.

And Dulcolax works so predictably that the time of bowel movement can often be predicted. Tablets taken at night usually produce a bowel movement the following morning. Suppositories generally work in 15 minutes to an hour.

For preoperative preparation, a combination of tablets at night and a suppository the next morning usually cleans the bowel thoroughly.

Dulcolax suppositories may be particularly helpful when straining should be avoided, as in postoperative care. Keep in mind, however, that the drug is contraindicated in the acute surgical abdomen.

Dulcolax®...it's predictab
bisacodyl

It's Important to be Informed on . . .

INFORMED CONSENT

Cases brought against physicians based upon failure to obtain "informed" consent are on the increase.

One court has held that physicians must inform their patients, in plain language, about:

1. The nature of the ailment;
2. The nature of the proposed treatment;
3. The probability of success of alternatives;
4. The risks of unfortunate results and unforeseen conditions within the body, in some cases.

Other courts have referred to the obligation to make "reasonable" disclosure, and have stated that physicians are not required to set forth overly broad explanations of risks where they might make patients unduly apprehensive. They have further stated that physicians could withhold information where it would jeopardize the patient's recovery.

Obviously, the law is not entirely clear on the subject of informed consent. But one thing **is** clear.

Nothing is more important than good doctor-patient relationships, based upon mutual respect and confidence.

Enlist your patient's intelligent cooperation by explaining **what** you intend to do, and **why.** Inform the patient or, where indicated, a responsible member of his family of the potential dangers that are involved.

ILLUSTRATED DICTIONARY OF EPONYMIC SYNDROMES AND DISEASES AND THEIR SYNONYMS, Stanley Jablonski; The W. B. Saunders Company, Philadelphia, Pa. 1969.

This book attempts to unravel difficulties in communication by presenting the vast profusion of eponyms and descriptive synonyms that are used to designate syndromes and diseases. It succeeds admirably. The American form of alphabetizing and spelling are used throughout. In addition, the eponymic names of pathological conditions, named after discoverers, literary and mythological characters, as well as patients, are all cross-referenced. Only terms used at least twice in the literature were included in the dictionary, which is an excellent volume to add to a reference library.

FUNDAMENTALS OF INHALATION THERAPY, Donald F. Egan, MD; The C. V. Mosby Company, St. Louis, Mo. 1969.

This book provides what is accepted as minimum knowledge for safe and effective administration of inhalation therapy. It is intended primarily for the student inhalation therapist and for the working therapist who requires a reference for review, but is also recommended for the practicing physician. The book furthers the physician's understanding of the fundamentals of the therapy he prescribes in an attempt to increase his knowledge of its use and expectations.

Dr. Egan's book is being added to the Faculty library, and will increase the scope of works in this field and make available, to those interested, additional such material.

ATLAS OF OBSTETRIC TECHNIC, J. Robert Willson, MD; The C. V. Mosby Company, St. Louis, Mo. 1969.

Although the illustrations have not been changed, the text of the second edition of this publication has been completely revised to include newer methods, techniques, tests, and procedures in obstetrics. Primarily a reference text for residents and physicians, this book is also helpful to medical students.

ACUTE RENAL FAILURE, Robert C. Muehrcke, MD; The C. V. Mosby Company, St. Louis, Mo. 1969.

This book illustrates the diagnosis and management of patients with acute renal failure, and is intended for use by physicians in all fields of medicine, as well as by medical students. It outlines the vast spectrum of acute oliguric renal failure: the complex etiology, the numerous pathogenic conditions, the tedious management, and varied prognoses of the disease. Not intended as an encyclopedia on renal failure, this book merely describes the broad variations in the clinical course of patients with this condition.

STUDIES IN CLINICAL ENZYMOLOGY, D. P. Mullan, MD; The C. V. Mosby Company, St. Louis, Mo. 1969.

Dr. Mullan has taken several topics within the field of clinical enzymology and has described the enzyme changes that occur. This book is well documented: It includes a lengthy list of credits to the consultants who worked with Dr. Mullan in preparing this book. Of particular interest are the sections on Nairobi patients, and enzyme changes in African heart disease patients in Nigeria.

The monograph covers a wide field of interest. It has special interest for the obstetrician, pediatrician, neurologist, and those interested in tropical medicine, and is well worth reading.

SCHIZOPHRENIA AND THE NEED-FEAR DILEMMA, Donald L. Burnham, MD, Arthur I. Gladstone, PhD, and Robert W. Gibson, MD; International Universities Press, Inc., New York, New York 1969.

This book presents clinical histories in an attempt to explain the nature of the human experience of the schizophrenic individual. The authors offer a structural psychological theory to account for the observed behavior and reported feelings of the patient, relating these to the changes in the course of personality development. The schizophrenic person is not regarded as a deteriorated individual, cut off from others by an autistic barrier, and out of touch with reality; the authors see the symptoms of the patient as an adaptive effort in an attempt to organize his world. In the acknowledgements section of the book, credit is given to the clinical facilities of the Chestnut Lodge Research Institute, of Rockville, Maryland, which were used in this study, under the direction of Dexter M. Bullard, MD, for its "excellent clinical program." This, then, is truly a Maryland project. It is a book well worth reading and keeping for reference purposes.

The girth control pill

Tepanil® Ten-tab®

(continuous release form)

(diethylpropion hydrochloride)

works on the appetite not on the 'nerves'

When girth gets out of control, TEPANIL can provide sound support for the weight control program you recommend. TEPANIL reduces the appetite—patients enjoy food but eat less. Weight loss is significant—gradual—yet there is a relatively low incidence of CNS stimulation.

Contraindications: Concurrently with MAO inhibitors, in patients hypersensitive to this drug; in emotionally unstable patients susceptible to drug abuse.

Warning: Although generally safer than the amphetamines, use with great caution in patients with severe hypertension or severe cardiovascular disease. Do not use during first trimester of pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of therapy, unpleasant symptoms with diethylpropion hydrochloride have been reported to occur in relatively low incidence. As is characteristic of sympathomimetic agents, it may occasionally cause CNS effects such as insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has been reported. In a few epileptics an increase in convulsive episodes has been reported. Sympathomimetic cardiovascular effects reported include ones such as tachycardia, precordial pain, arrhythmia, palpitation, and increased blood pressure. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride; this was an isolated experience, which has not been reported by others. Allergic phenomena reported include such conditions as rash, urticaria, ecchymosis, and erythema. Gastraintestinal effects such as diarrhea, constipation, nausea, vomiting, and abdominal discomfort have been reported. Specific reports on the hematopoietic system include two each of bone marrow depression, agranulocytosis, and leukopenia. A variety of miscellaneous adverse reactions have been reported by physicians. These include complaints such as dry mouth, headache, dyspnea, menstrual upset, hair loss, muscle pain, decreased libido, dysuria, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallowed whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times daily, one hour before meals. If desired, an additional tablet may be given in midevening to overcome night hunger. Use in children under 12 years of age is not recommended.

MEDICAL NEWS

Russell S. Fisher, MD, Chief Medical Examiner for Maryland, along with representatives from the American Medical Association and the American Association of Medical Assistants, are consultants to a new film entitled "Case in Point", which outlines the precautions the medical assistant and her physician-employer can take to protect themselves from lawsuits. A documentary film, it depicts professional activities of the medical assistant, and shows the importance of observing certain safeguards in such areas as office medical procedures, record keeping, dangerous conditions in the doctor's office, relations with patients, and handling of information about patients.

"Case in Point" is jointly produced by the American Association of Medical Assistants and Wyeth Laboratories.

Dr. Fisher

The following Maryland physicians were recently elected to Fellowship in the American College of Physicians: **Robert O. Biern, MD; Torrey C. Brown, MD; Arthur E. Cocco, MD; Richard J. Johns, MD; Patricia A. McIntyre, MD; Joseph S. Redding, MD; Alexander S. Townes, MD; William V. Zussman, MD; Emidio A. Bianco, MD;** and **A. Austin Pearre, Jr., MD.**

* * *

Jonas Rappeport, MD, of Baltimore, has been elected president of the newly formed American Academy of Psychiatry and Law, which held its first meeting at the Friendship International Hotel on November 16, 1969. Dr. Rappeport has also been named to serve a one-year term on the AMA Committee on Medicolegal Problems, starting January 1, 1970.

* * *

St. Agnes Hospital's blood bank has been accredited by the American Association of Blood Banks, with headquarters in Chicago, Illinois. The announcement was made by the Association's president, Frank C. Coleman, MD.

* * *

Gerard F. Devlin, Maryland's Federal Relations Officer, was asked by President Nixon to participate in the **White House Conference on Food, Nutrition and Health,** held in Washington, DC, December 1 through December 4. A member of Governor Mandel's Commission on Childhood Nutrition, Mr. Devlin has been assigned by the President to work with the Conference's State and Local Government Panel.

* * *

The development of a new orthopedic cast material, **Lightcast,** a lightweight, strong, moisture-resistant, resin-impregnated fiberglass tape, has been announced by **Solar Laboratories, Inc.,** of Gardena, California. The new material, designed to replace the plaster cast, was introduced in conjunction with medical meetings of the Americal Academy of General Practice and the Western Orthopedic Association.

The cast allows for air circulation, and is soft and flexible. The tape is wrapped around the fracture and then cured by exposure to a specific wave-length light to form a hard, lightweight cast. It is only about one third the weight, and allows for more comfort and mobility than the old version, and permits the wearing of normal clothing over the cast.

* * *

The Commonwealth Fund, the American philanthropic foundation, has made a grant to **The Johns Hopkins University School of Medicine,** which will enable the school to expand and continue its faculty and post-doctoral program with the medical schools of the American University of Beirut, Lebanon, and the Peruvian University Cayetano Heredia, in Lima.

* * *

Hugh M. Hill, MD, FACOG, professor of obstetrics and gynecology at the University of Florida College of Medicine in Gainesville, received the school's first Hippocratic Award for Teaching Excellence. Originated by the class of 1969, the award will be presented annually to the teacher who, in the opinion of the students, most enriched their minds during their four years in medical school. Dr. Hill, who joined the faculty in 1957, is a graduate of Davidson College, Davidson, N.C. He received his MD degree from The Johns Hopkins University School of Medicine.

The presentation was made in conjunction with the planting of a cutting from the ancient

sycamore tree under which the father of medicine, Hippocrates, reputedly taught in the fifth century B. C. Dr. Hill's name was inscribed on a plaque mounted on a large stone at the base of the tree.

* * *

The American Board of Obstetrics and Gynecology has announced its schedule of examinations for the coming two years.

Applications for the written exams must be postmarked on or before November 30, 1970 or November 30, 1971 in order for the applicant to be considered for the written examination on June 21, 1971 or June 19, 1972, respectively.

For the orals, applications must be postmarked *between* January 1 and February 28, 1970, January 1 and February 28, 1971, and January 1 and February 28, 1972 in order to be considered for examinations on November 2-6, 1970, November 1-5, 1971, and October 30-November 3, 1972, respectively.

For additional information write: Clyde L. Randall, MD, Secretary-Treasurer, American Board of Obstetrics and Gynecology, 100 Meadow Rd., Buffalo, N. Y. 14216. Phone: (716) 875-1573.

* * *

In a statement appearing in the November 1969 issue of the American Academy of Pediatrics Journal, *Pediatrics,* the Academy's **Committee on International Child Health** called for the establishment of community health centers throughout North, Middle, and South America to study and develop methods which will identify, reduce, and eventually help prevent the avoidable illnesses and nutritional deficiencies which lead to infant mortality. Such methods would include family planning.

* * *

Early in December, **Dana L. Farnsworth, MD,** Chairman of the AMA Council on Mental Health, appeared before the Senate Committee on the District of Columbia to present the Association's support of the District of Columbia Comprehensive Drug Abuse and Narcotic Crime Control Act of 1969. The Act calls for a comprehensive program for the control of drug abuse and drug related crime through improved law inforcement, the strict regulation of the distribution of controlled drugs, and the prevention, treatment, and study of drug abuse and drug dependence.

* * *

Senator Proxmire (D., Wisc.) introduced the **Regional Water Quality Bill** early in December, which is aimed at penalizing industries which pollute rivers and streams. Under the proposal, a schedule of substantial fees would be charged an industry for polluting rivers and streams, depending upon the quantity and toxicity of the pollution. Half of the money received would help finance local waste treatment projects; the remainder would be used for regional pollution planning projects. The bill was referred to the Senate Committee on Public Works.

* * *

Episodic Behavioral Disorders, by **Russell R. Monroe, MD,** of the University of Maryland School of Medicine, is one of the six manuscripts completed and accepted by the Harvard University Press, the Commonwealth Fund's cooperating publisher. Dr. Monroe's manuscript deals with the "classification and analysis of recurrent behavioral abnormalities stemming from episodic mental illness and neurophysiologic disorders, including epilepsy."

* * *

Applications are now being accepted for the **E. V. Allen Memorial Scholarships,** open to junior and senior medical students attending medical schools in the United States or Canada. The scholarship provides three months of cardiovascular study at the Mayo Clinic in Rochester, Minnesota, as well as a $1,000 award. Deadline for applications is April 1, 1970; applicants will be notified by May 1, 1970.

Brochures may be obtained by writing to the Minnesota Heart Association, 4701 West 77th Street, Edina, Minnesota 55435.

* * *

On November 20, 1969, HEW Secretary Robert H. Finch accepted recommendations of a **Medical Advisory Group on Cyclamates,** which previously had weighed the potential benefits of non-nutritive sweeteners such as cyclamate against any possible harmful effects. The scientific group stated that the medical benefits outweighed the possibility of harm in weight control programs, and for use by diabetics. The physicians also recommended that foods containing cyclamates continue to be available, but would include a warning and a statement of the cyclamate content of an average serving on the label.

* * *

Curt P. Richter, PhD, Professor Emeritus of Psychobiology at The Johns Hopkins University School of Medicine, and an honorary member of the Baltimore City Medical Society, has received support from the Commonwealth Fund Book program for his project on the 24-hour time cycle in the regulation of behavorial and metabolic functions in animals and man.

* * *

Julius R. Krevans, MD, Professor of Medicine and Dean of Academic Affairs at Johns Hopkins, along with other distinguished medical educators, recently participated in a series of

informal meetings, also attended by staff members of the Carnegie Corporation and the Commonwealth Fund, which provided start-up grants for this collaborative program to underwrite the employment of a full-time faculty program director at each represented school for a two-year period. Each of the Departments of Medicine will encourage faculty from throughout the university to participate in the activities of the Department, permitting them to advance their plans to extend graduate specialty education for interns and residents and produce a significant number of clinical scholars.

* * *

The 1969 Griffin Award was presented to **Melvin M. Rabstein, DVM,** Chief of the Animal Farm Division at Fort Detrick, in Frederick, at the 20th Annual Session of the American Association for Laboratory Animal Science, held in Dallas, Texas, in October 1969, for his outstanding accomplishments in the improvement of the care and quality of animals used in biological and medical research. **Edward C. Melby, Jr., DVM,** of The Johns Hopkins University in Baltimore, was installed as AALAS president for the coming year.

* * *

In December 1969, members of the **American Medical Association,** the **Student American Medical Association,** and the **Association of American Medical Colleges** presented a joint statement before the Subcommittee on Labor and HEW of the Senate Appropriations Committee, in support of full funding of the Health Professions Student Loan Program. They stressed continued support of the program that would further the recruitment of medical students from financially disadvantaged backgrounds and provide them with substantial financial support to complete their medical education. The AMA representatives also asked for aid in improving the medical library and educational facilities.

* * *

The Maryland Association For Mental Health and its president, **Reuben Shiling,** have expressed approval of the decision made by the Secretary of Health and Mental Hygiene, **Neil Solomon, MD, PhD,** to resume planning and construction work for Baltimore's **Inner City Community Mental Health Center.** According to Mr. Shiling, "We hope this means that the plans of the Department of Mental Hygiene, as presently conceived under Commissioner Dr. James Carson, will be given high priority."

* * *

Recipients of the **27th Gorgas Medal** for 1969 are **Karl M. Johnson, MD,** and his wife **Patricia A. Webb, MD,** both members of the U. S. Public Health Service working in the Panama Canal Zone. The medal, with a citation and an honorarium, was recently presented to the husband-wife team at the annual meeting of the Association of Military Surgeons of the United States, for their "research efforts to prevent and eradicate Bolivian Hemorrhagic Fever, and for their dedication to the improved health of the peoples of Central and South America."

The award was established in 1942 by Wyeth Laboratories to honor Major General William C. Gorgas, whose public health programs in the Panama Canal Zone over 60 years ago helped to control yellow fever and malaria in Panama, and thus made possible the building of the Panama Canal. Each year, the Association of Military Surgeons selects the individual to be honored for contributions in the field of preventive medicine.

* * *

(Continued next page)

Gorgas Medal winners for outstanding accomplishments in preventive medicine are (from right) Karl M. Johnson, MD, and his wife, Patricia A. Webb, MD, both of the U.S. Public Health Service working in the Panama Canal Zone. Presenting the award is George E. Farrar, Jr., Director of Medical Services for Wyeth Laboratories, sponsors of the Medal.

Sheppard Kaplow, MD, of Baltimore; **Shakuntla Devi Mahajan,** MB, of Hyattsville; and **John P. Swope, MD,** of Bethesda, members of the American Society of Anesthesiologists, have recently been named Fellows of the Society.

* * *

The following physicians have each served a two-month tour in the **Volunteer Physicians for Viet Nam** program: **Robert E. Eby, MD,** of College Park; **Andre V. Fesus, MD,** of Baltimore; **Michael B. Flynn, MD,** of Baltimore. **Wayne K. Foster, MD,** of Cecilton, served four two-month tours. **Stephen M. Nagy, Jr., MD,** of Baltimore. **Louis Padovano, MD,** of Woodstock, and **Thomas H. Powell, MD,** of Baltimore, served two two-month tours. **Glendon E. Rayson, MD,** of Baltimore; **Patrick A. Reardon, MD,** of Seabrook; **Donald K. Wallace, MD,** of Baltimore; and **Celeste L. Woodward, MD,** of Baltimore, served one tour.

* * *

On December 3, 1969, former U. S. Attorney General **Nicholas deB. Katzenbach** spoke on drug addiction and rehabilitation at the eighth annual meeting of the **Anne Arundel County Mental Health Association** in Annapolis, a meeting co-sponsored by the Mental Health Association and the Anne Arundel County Jaycees.

Mr. Katzenbach is presently Chairman of the Board of the Narcotics Addiction Research and Treatment Corporation of New York City.

* * *

The Columbia Hospital and Clinics Foundation, of Columbia, Maryland, an affiliate of The Johns Hopkins Medical Institutions, officially opened October 1, 1969. The Columbia Clinic, an experiment in health care delivery, is complete with a laboratory and X-ray rooms. Until the permanent hospital is built in Columbia, hospital services to members of the Columbia Medical Plan will be provided at the Clinic.

* * *

Carolyn S. Pincock, MD, a pediatrician from Silver Spring, has been elected 66th president of the Montgomery County Medical Society. She succeeds **Merton L. White, MD,** who recently retired. At the Society's annual dinner dance, Dr. Pincock was given the "Henry P. Laughlin" award for outstanding service in the field of adolescent medicine.

Dr. Pincock is active in the Maryland Chapter of the American Academy of Pediatrics and is a past president of the American Medical Woman's Association.

Dr. Pincock

* * *

A project supported by a $300,000 grant from the National Institute of Mental Health is underway at **The Johns Hopkins Medical Institutions** to study women suffering from depression. Hopefully, knowledge gained from this study will further effective treatment methods for outpatients in private offices and clinics. The project, headed by study director **Lino Covi, MD,** will evaluate the effects of certain anti-depressant drugs upon depressed women being treated as outpatients, and also examine the influence of group psychotherapy when used in conjunction with the drugs.

Volunteers are still needed for the study. Applicants must be depressed women between 20 and 60 years of age, but not psychotic or in need of hospitalization. They cannot be alcoholics or addicts, and must be free of liver and cardiovascular diseases. Patients may be referred by physicians, or may contact Dr. Covi at The Johns Hopkins Hospital.

* * *

Among the newly elected members to the board of directors of the National Society for the Prevention of Blindness is **Richard E. Hoover, MD,** an ophthalmologist from Baltimore, and a member of the NSPB Committee on Low Vision Aids. Dr. Hoover will serve a three-year term.

* * *

Robert W. Berliner, MD, Deputy Director for Science at the National Institutes of Health, in his presidential address before the American Society of Nephrology on December 1, 1969, suggested using "the equivalent of a brief commercial before each therapeutic measure, of each dose of vaccine, each effective drug," to stress the critical link between medical research and adequate medical care. Dr. Berliner underlined the important role of research in developing an ability to distinguish hasty assertion from documented fact. He warned against "the tendency in medical education to abandon rigor and firm basic physiologic understanding in favor of the once-over-lightly in science and a heavy layer of community dynamics."

Dr. Berliner, one of the world's foremost renal physiolo-

gists, is credited with leading the way to understanding the balance of sodium and potassium salts in the blood, the mode of transfer of electrolytes across the kidney tubules, and the development of theories on the mechanism of urinary dilution and concentration.

* * *

George N. Webb, MS, of The Johns Hopkins University Medical School, will be among the speakers at the Second National Conference and Exposition on Electronics in Medicine, to be held at the Fairmont Hotel in San Francisco on February 12-14, 1970. The meeting is sponsored by the Electronics Management Center of McGraw-Hill Publications Company.

The Conference will present specific seminar-style discussions of problems and developments in medical engineering, instrumentation, and data handling, as well as two afternoons of concurrent workshops and an expanded display of electronics equipment used in the medical field.

Roger O. Egeberg, MD, Assistant Secretary of the Department of Health, Education and Welfare will also address the many medical and engineering specialists from around the world.

* * *

Solomon H. Snyder, MD, of Baltimore, has been awarded the Maryland Academy of Sciences' 1969 "Outstanding Young Scientist Award" for his significant contributions that will lead to more certain recognition and predictability of the action of hallucinogenic drugs, and more efficacious management of Parkinsonism and mental illness. The associate professor of pharmacology and psychiatry at The Johns Hopkins University School of Medicine received the Allan C. Davis Medal and a $500 check at a banquet held at the Belvedere Hotel in Baltimore on December 8, 1969.

A 1962 graduate of Georgetown Medical School, Dr. Snyder is making significant contributions in research on the amines in nervous tissue, on the pineal gland, and on histamine and histidine metabolism. Judges for this year's award included **Herman Z. Cummins, MD,** professor of physics, The Johns Hopkins University School of Medicine, and **Leon Weiss, MD,** professor of anatomy, The Johns Hopkins University School of Medicine.

* * *

In a recent *Bulletin* of the American Academy of Orthopaedic Surgeons, **Allen Fiske Voshell, MD,** was featured as the "orthopaedic personality" of the month. Dr. Voshell has been one of Baltimore's outstanding leaders in the field of orthopaedic surgery for many years. He graduated from The Johns Hopkins University in 1915, and from the medical school of that university in 1919. Following graduation, he served a one-year internship in orthopaedic surgery at The Johns Hopkins Hospital, and a one-year residency in the same field. In 1921, he organized the Department of Orthopaedic Surgery at the University of Virginia, and an effective program of rural clinics. Ten years later, he returned to Baltimore to accept two positions: Professor of Orthopaedic Surgery at the University of Maryland School of Medicine, and Surgeon-in-Chief of the James Lawrence Kernan Hospital for Crippled Children. He was responsible for developing Departments of Physical and Occupational Therapy, organizing rural clinics for the State Health Department, and setting up coordinated residency training programs in several affiliated hospitals.

Although now retired, Dr. Voshell still maintains a private practice and indulges in research. His major interest is the anatomy and mechanics of the knee joint, which led to his receiving the Gold Medal of the American Academy of Orthopaedic Surgeons in January 1941 for his exhibit on "The Mechanics and the Ligaments and Menisci of the Knee Joint." He was on the American Board of Orthopaedic Surgery from 1942 to 1951, and served as its president from 1949 to 1951.

* * *

Governor Mandel

Governor Marvin Mandel is considering legislation that would allow parents to report children suspected of using drugs to law enforcement authorities without fear of prosecution or criminal record. He also supports legislation introduced in the U. S. Senate by Senator Joseph D. Tydings that would strengthen the penalties for narcotics wholesalers and the position of law enforcement officials in apprehending sellers of drugs. Governor Mandel has asked the newly-created Maryland Drug Abuse Authority to review both recommendations which are directly aimed at suppliers of drugs and the rehabilitation of users. A special brochure is also being prepared that will help parents detect drug use by their children, and will also provide information on securing help for such youngsters.

* * *

Medical and Chirurgical Faculty

The scientific sessions of the 1970 Annual Meeting will be held at the Alcazar in Baltimore. Scheduled to present papers are

William P. Beetham, Jr., MD
Lahey Clinic Foundation
Boston

Daniel M. Gordon, MD
Associate Professor of Ophthalmology
Cornell University Medical College
New York

George James, MD, Dean
Mount Sinai School of Medicine
New York

Roy W. Menninger, MD, President
The Menninger Foundation
Topeka, Kansas

William H. Moretz, MD, Chairman
Department of Surgery
Medical College of Georgia

Hu C. Myers, MD
The Myers Clinic
Philippi, West Virginia

John Rock, MD
Clinical Professor Emeritus of Gynecology
Harvard Medical School
Director, Rock Reproductive Clinic, Inc.
Cambridge, Massachusetts

Frank C. Spencer, MD
Department of Surgery
New York University
New York

Felix Wroblewski, MD
Associate Professor of Clinical Medicine
Cornell University Medical College
New York

Medical Grand Rounds will be presented by A. McGehee Harvey, MD, and staff members of the Department of Medicine of The Johns Hopkins University. Surgical Grand Rounds will be presented by Robert W. Buxton, MD, and staff members of the Department of Surgery of the University of Maryland.

Other activities scheduled are

Annual Round-Table Luncheon, at the Belvedere Hotel, will include luncheon meetings of the alumni associations of several medical schools, and informal scientific discussions

Hospitality Night—this proved so very popular at the 1969 Meeting, that it will be repeated in 1970 at the Belvedere Hotel—vocal and instrumental entertainment will be provided

Annual Presidential Reception and Banquet—at the Blue Crest North, well known for its delectable cuisine, hors d'oeuvres, and cocktails—in a delightful atmosphere with professional entertainment, and dancing for everyone to the music of Rivers Chambers' Orchestra

Arts and Hobby Exhibit—at the Alcazar—a chance for you to put your unusual talents on display (see page 59 for the application form)

Health Evaluation Tests—at the Alcazar—an easy way to augment your annual checkup

Scientific and technical exhibits will be on display each day of Annual Meeting at the Alcazar—the exhibits constitute a symposium on therapeutic progress

Committee on Program and Arrangements
DeWitt E. DeLawter, MD, *Chairman*

172nd ANNUAL MEETING

of the State of Maryland

APRIL 1, 2, 3

Among the many prominent physicians who will speak at the Annual Meeting are Doctors **Dan Gordon, George James, Roy Menninger, and William Moretz.**

Roy W. Menninger, MD, will open the scientific program on Wednesday, April 1 with a discussion of the physician-patient relationship, and the problems of managing a neurotic patient. Dr. Menninger is the fourth president of the world famous Menninger Foundation of Topeka, Kansas, a nonprofit organization devoted to psychiatric treatment and research, preventive psychiatry, and professional education in psychiatry and the allied mental health fields. The eldest son of the late William C. Menninger, MD, Dr. Menninger joined the staff of the Foundation in 1961. Prior to his election as President, he was Director of the Department of Preventive Psychiatry.

Dr. Menninger

A Fellow of the American Psychiatric Association and the American College of Physicians, Dr. Menninger is also an active member of the Group for the Advancement of Psychiatry, the American Association for the Advancement of Science, the American Orthopsychiatric Association, and many other organizations.

Dr. Menninger graduated from Swarthmore College and received his medical doctorate from the Cornell University Medical College. His psychiatric residency was taken at three Boston Hospitals: Boston State, Boston Psychopathic, and Peter Bent Brigham. He served as Chief of Neuropsychiatry at an Army Hospital in Salzburg, Austria.

Special interests of Dr. Menninger are social and community psychiatry, school mental health, group therapy, and psychiatric education for general practitioners and internists. His personal hobbies and sports include collecting stamps and minerals, model railroading, camping, cello, civic symphony, and bicycling.

On Friday morning, April 3, **William H. Moretz, MD,** Chairman of the Department of Surgery at the Eugene Talmadge Memorial Hospital, Medical College of Georgia, will speak on "Pulmonary Embolism: Its Causes and Prevention." Dr. Moretz received his BS degree from Lenoir Rhyne College, attended the University of North Carolina School of Medicine, and received his MD degree from Harvard Medical School. Surgical training at the Strong Memorial Hospital in Rochester, New York, was followed by an instructorship in surgery at the University of Rochester School of Medicine. From 1947 to 1955, Dr. Moretz was Assistant Professor of Surgery and Associate Professor of Surgery at the University of Utah School of Medicine. In 1955 he was appointed professor of surgery and chairman of the Department of Surgery at the Medical College of Georgia, positions that he still holds.

Dr. Moretz

Dr. Moretz is a member and fellow of numerous surgical associations including the Society of University Surgeons, Southern Surgical Association, American Surgical Association, International Surgical Society, and the American College of Surgeons. He is a diplomate and a member of the American Board of Surgery. Vascular diseases and acute surgical diseases of the abdomen are among his research interests.

"The Future of Medical Education: Undergraduate and Postgraduate" will be the title of the paper presented by **George James, MD,** on Wednesday afternoon, April 1.

As a BA graduate of Columbia University, Dr. James received his medical degree at Yale University. He also holds a Master of Public Health degree from The Johns Hopkins University. He began his professional career in public health in 1942 in Tennessee, where he became health officer for Obion and Lake Counties, serving in that capacity for two years. Since then, he has been Commissioner of Health in Ulster County, New York; Assistant Commissioner in the New York State Department of Health; and Director of Health for the City of Akron, Ohio. He worked with the New York City Department of Health from 1956 to 1965, the last three years as Commissioner of Health, and Chairman of the Board of Health.

Dr. James

Dr. James left his position as Commissioner of Health of New York City to join Mount Sinai in 1965 as Dean of the School of Medicine, and in 1968 became President of the Medical Center.

Some of the offices he has held in professional organizations and government agencies include: vice president for Public Health, American College of Preventive Medicine; chairman of the committees of the American Public Health Association in such areas as health manpower, primary prevention, and professional examination service; president, Conference of County, City, and District Health Officers of New York State; vice chairman, Interdepartmental Health Council; and president of the Medical and Health Research Association of New York, Medical Library Center of New York, National Health Council, New York City Public Health Association, and New York State Academy of Preventive Medicine.

Dr. James has been active as a medical educator for many years, with service on the faculties of Yale University, The Johns Hopkins University, Albany Medical College, Columbia University, Harvard University, and the St. John's University School of Education.

Dan M. Gordon, MD, of New York, will speak on a subject of wide interest to general practitioners and internists, as well as to ophthalmologists: "The Eye in Systemic Disease". Dr. Gordon received both his BS and MD degrees at the University of Michigan.

Since 1963, Dr. Gordon has been Associate Professor (surgery) of Ophthalmology at Cornell University Medical College. Prior to this appointment, his training included positions as resident at the Illinois Eye and Ear Infirmary, surgeon at the New York Hospital, associate attending surgeon at the New York Hospital, and consultant assistant in Ophthalmology at the Memorial Hospital in New York City.

Dr. Gordon

Dr. Gordon is a fellow of the American College of Surgeons, the New York Academy of Medicine, and American Academy of Ophthalmology and Otolaryngology, in addition to holding memberships in many other medical and scientific societies. Among the books he has had published are "Medical Management of Ocular Disease", and "Uveitis, International Ophthalmology Clinic". He is Editor of "International Ophthalmology Clinics—Volumes 7 and 8, 1967-69". He has also had published approximately 160 articles in various medical journals.

Dr. Gordon is a breeder and judge of boxer dogs, and is the author of six books on these dogs.

THE EXHIBITS—A WORTHY FEATURE OF THE EDUCATIONAL PROGRAM

of the

MEDICAL AND CHIRURGICAL FACULTY ANNUAL MEETING

at the Alcazar

APRIL 1, 2, 3, 1970

TECHNICAL EXHIBITORS

(as of December 15, 1969)

Abbott Laboratories
Apache Oil Programs, Inc.
Ayerst Laboratories
Baltimore Dictating Machine Company
Bristol Laboratories
Ciba Pharmaceutical Company
Herbert Cox, Correct Shoes
Doctors Supply Company
Eaton Laboratories
The Emko Company
Encyclopaedia Britannica, Inc.
Flint Laboratories
Graymar Company
Hoechst Pharmaceutical Company
Knoll Pharmaceutical Company
Lakeside Laboratories, Inc.
Lederle Laboratories
Eli Lilly and Company
Marion Laboratories, Inc.
Maryland Blue Cross and Blue Shield Plans
Mead Johnson Laboratories
Medco Products Company, Inc.
Merck Sharp & Dohme
Merrill Lynch, Pierce, Fenner & Smith, Inc.
Murray Baumgartner Surgical Instrument Co.
Wm. P. Poythress & Company, Inc.
William H. Rorer, Inc.
Sandoz Pharmaceuticals
W. B. Saunders Company
G. D. Searle & Company
Security House, Inc.-The Denver Corp.
Skill Surgical, Inc.
Smith, Miller & Patch, Inc.
E. R. Squibb & Sons, Inc.
Sun Life Assurance Company of Canada
Warner-Chilcott Laboratories, Inc.

Smith Kline & French Laboratories, Geigy Pharmaceuticals and Hynson, Westcott & Dunning, Inc., are making a contribution, although they are unable to have exhibits this year.

ARTS AND HOBBY EXHIBIT

Annual Meeting of the Medical and Chirurgical Faculty

APRIL 1, 2, 3, 1970 The Alcazar, Baltimore

APPLICATION FOR ARTS AND HOBBY EXHIBIT

Fill in and mail to: Chairman, Arts and Hobby Exhibit
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore 21201

1. Title of exhibit: .....

.....

2. Amount of space required—depth, width, and height: .....

3. Electrical or other requirements: .....

4. Name of exhibitor: .....
Please print

5. Address of exhibitor: .....

6. Telephone number of exhibitor: .....

An Arts and Hobby Exhibit will be held during the 172nd Annual Meeting of the Medical and Chirurgical Faculty. Physicians, their wives and families are asked to help make this exhibit an outstanding one with many interests on display. Anything made by the exhibitor is eligible. Entries will be accepted until all exhibit space is allotted. Please have exhibits framed or mounted.

Entries should be delivered to The Alcazar, Cathedral and Madison Streets, Baltimore, between 9:00 AM and 4:30 PM on Tuesday, March 31. They must be removed on Friday, April 3, between 1:30 and 4:30 PM. The Faculty cannot carry insurance on your exhibit, but utmost care will be taken of it. There will be a watchman on duty when the meeting is not in session. Probably the exhibitors' personal policies will cover the exhibit.

Certificates will be awarded to the prize-winning exhibits. The names of exhibitors received by February 1, 1970, will be listed in the printed Annual Meeting program. However, all entries should be submitted as early as possible.

Committee for Arts and Hobby Exhibits:

Mrs. Charles H. Williams, *Chairman*
Mrs. George H. Yeager, *Chairman, Judging*
Mrs. Kurt Lederer
Mrs. Marvin I. Mones

MAKE YOUR HOTEL ROOM RESERVATIONS NOW

for the

ANNUAL MEETING OF THE MEDICAL AND CHIRURGICAL FACULTY

APRIL 1, 2, 3, 1970

A block of rooms has been set aside at the BELVEDERE HOTEL, Baltimore, for those attending this meeting. Because of many activities in the city, rooms will be at a premium.

The rates are $19.00 for a double or twin bedded room for two persons; single occupancy rate is $15.00; and suites are $25, $30, and $40.00.

FOR YOUR HOTEL RESERVATION DETACH AND MAIL THIS SLIP DIRECTLY TO:

Mrs. Jacqueline Amati
BELVEDERE HOTEL
Charles & Chase Sts., Balto., Md. 21202

Name .....

Address ..... City ..... State .....

Please reserve ..... rooms Approximate rate ..... No. of persons.....

Date of arrival ..... Date of departure .....

Attending Annual Meeting of the Medical and Chirurgical Faculty.
All requests subject to confirmation.

Let's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,400 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

NOW IS THE TIME... TO GIVE HER TIME WITH OVULEN-21®

Each tablet contains ethynodiol diacetate 1 mg., mestranol 0.1 mg.

The new mother needs time . . .
to adjust to motherhood,
to give her new baby all the love
and attention he requires.
She needs time for her husband . . .
and for herself as well . . . .
so that she can come to terms
with the increased cares
and responsibilities now facing her.
She needs time to decide
when she will have additional children
and how many she will have.

OVULEN-21®

Each tablet contains ethynodiol diacetate 1 mg., mestranol 0.1 mg.

GIVES HER TIME

Your prescription for Ovulen-21 gives the new mother time to meet her family's present needs... to plan for her family's future.

She can take Ovulen-21 confidently and comfortably month after month. Its dependability is enhanced by its simplicity of use. A woman needs little or no time to learn the simple Ovulen-21 regimen: three weeks on—one week off. And the automatic record-keeping of the petite, virtually "patient-proof" Ovulen-21 Compack® helps to maintain her schedule...helps put time on her side.

Immediately post partum is the time

It is the time when motivation is highest—when a new mother needs expert advice for the future, so she can space her children and limit her family.

It is also the most opportune time, since she is conveniently present in the hospital, for her to be given both instructions and a prescription.

Non-nursing mothers may begin Ovulen-21 immediately after delivery, on the day of departure from the hospital or at the first postpartum visit, as desired. It is recommended that nursing mothers begin Ovulen-21 four weeks after delivery.

A small fraction of the hormonal agents in oral contraceptive pills has been identified in the milk of mothers receiving these drugs. The long-range effect on the nursing infant cannot be determined at this time.

Indication—Oral contraception.

Contraindications—Thrombophlebitis, thromboembolic disorders, cerebral apoplexy or a past history of these conditions, markedly impaired liver function, known or suspected carcinoma of the breast, known or suspected estrogen-dependent neoplasia, undiagnosed abnormal genital bleeding.

Warnings—Watch for the earliest manifestations of thrombotic disorders (thrombophlebitis, cerebrovascular disorders, pulmonary embolism, retinal thrombosis); if present or suspected discontinue the drug immediately.

British studies reported in April 1968[1,2] estimate there is a seven- to tenfold increase in mortality and morbidity due to thromboembolic diseases in women taking oral contraceptives. In these controlled retrospective studies, involving 36 reported deaths and 58 hospitalizations due to "idiopathic" thromboembolism, statistical evaluation indicated that the differences observed between users and non-users were highly significant. The conclusions reached in the studies are summarized in the table below:

Comparison of Mortality and Hospitalization Rates Due to Thromboembolic Disease in Users and Non-Users of Oral Contraceptives in Britain.

Category	Mortality Rates		Hospitalization Rates (Morbidity)
	Age 20-34	Age 35-44	Age 20-44
Users of Oral Contraceptives	1.5/100,000	3.9/100,000	47/100,000
Non-Users	0.2/100,000	0.5/100,000	5/100,000

No comparable studies are yet available in the United States. The British data, especially as they indicate the magnitude of the increased risk to the individual patient, cannot be applied directly to women in other countries in which the incidences of spontaneously occurring thromboembolic disease may differ.

Discontinue medication pending examination if there is sudden partial or complete loss of vision, or sudden onset of proptosis, diplopia or migraine. Withdraw medication if papilledema or retinal vascular lesions are found.

Since the safety of Ovulen in pregnancy has not been demonstrated, it is recommended that pregnancy be ruled out for any patient who has missed two consecutive periods before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule the possibility of pregnancy should be considered at the first missed period.

A small fraction of the hormone agents in oral contraceptives has been identified in the milk of mothers receiving these drugs. The long-range effect on the nursing infant cannot be determined at this time.

Precautions—Pretreatment physical examination should include special reference to the breasts and pelvic organs, and a Papanicolaou smear.

Endocrine and possibly liver function tests may be affected by Ovulen. Therefore, it is recommended that such tests if abnormal be repeated after the drug has been withdrawn for two months.

Pre-existing uterine fibromyomas may increase in size under the influence of progestogen-estrogen preparations.

Because these agents may cause some degree of fluid retention, conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation.

In breakthrough bleeding, and all irregular vaginal bleeding, consider nonfunctional causes. Adequate diagnostic measures are indicated in undiagnosed vaginal bleeding.

Carefully observe patients with a history of psychic depression and discontinue the drug if severe depression recurs.

Any possible influence of prolonged Ovulen therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study.

A decrease in glucose tolerance has occurred in a significant percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be observed carefully while receiving Ovulen.

Because of the effects of estrogens on epiphyseal closure Ovulen should be used judiciously in young patients in whom bone growth is not complete.

The age of the patient constitutes no absolute limiting factor, although Ovulen therapy may mask the onset of the climacteric.

The pathologist should be informed of Ovulen therapy when relevant specimens are submitted.

Adverse Reactions—A statistically significant association has been shown between use of oral contraceptives and the following serious adverse reactions: thrombophlebitis, pulmonary embolism.

Although available evidence is suggestive of an association, such a relationship has been neither confirmed nor refuted for the following serious adverse reactions: cerebrovascular accidents, neuro-ocular lesions, e.g., retinal thrombosis and optic neuritis.

The following adverse reactions are known to occur in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea during and after treatment, edema, chloasma or melasma, breast changes (tenderness, enlargement, secretion), change in weight, changes in cervical erosion and cervical secretions, suppression of lactation when given immediately post partum, cholestatic jaundice, migraine, allergic rash, rise in blood pressure in susceptible individuals, mental depression.

Although the following adverse reactions have been reported in users of oral contraceptives, an association has been neither confirmed nor refuted: anovulation post treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme and nodosum, hemorrhagic eruption, itching. The following laboratory results may be altered by oral contraceptives: hepatic function: increased sulfobromophthalein and other tests; coagulation tests: increase in prothrombin, Factors VII, VIII, IX and X; thyroid function: increase in PBI and butanol extractable protein bound iodine, and decrease in T^3 uptake values; metyrapone test; pregnanediol determination.

Where "The Pill" Began

G. D. SEARLE & CO., P.O. Box 5110, Chicago, Ill. 60680

SEARLE

Nose clear as a whistle

(THANKS TO DIMETAPP®)

Dimetapp Extentabs® does an outstanding job of helping to clear up the stuffiness, drip and congestion of colds and upper respiratory allergies and infections. Each Extentab keeps working up to 12 hours. And for most patients drowsiness or overstimulation is unlikely. Try Dimetapp. It clearly works.

FOR UPPER RESPIRATORY ALLERGIES AND INFECTIONS

Dimetapp Extentabs®

Dimetane® (brompheniramine maleate), 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.

UP TO 12 HOURS CLEAR BREATHING ON ONE TABLET

Indications: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, sinusitis, rhinitis, conjunctivitis, and otitis.
Contraindications: Hypersensitivity to antihistamines. Not recommended for use during pregnancy.
Precautions: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.
Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered.
Dosage: 1 Extentab morning and evening.
Supplied: Bottles of 100 and 500.

The Commission on Medical Discipline

Adopted by the 1968 State Legislature, and effective July 1, 1969, the Commission on Medical Discipline provides a clear mandate to the profession for self-policing. The nine men who comprise this group are charged with making a judicial determination on evidence referred to the Commission by the Medical and Chirurgical Faculty. Individual component societies are also involved, for complaints originating from any source are referred to the local level for interpretation and possible recommendations for disciplinary action. The local society may refer the matter for judgment on a state level. Such complaints must be followed by a report to the Commission within 90 days.

In its initial stages, the Commission has already received three cases pending within the Board of Medical Examiners. Several other cases have been submitted to the Faculty for investigation and a report to the Commission. In addition, a Commission on Optometry Discipline has been established, and a proposal for a Commission on Dental Discipline is under consideration.

The law establishing the Commission on Medical Discipline clearly outlines the grounds for taking appropriate action. The clarity of this law is a great improvement over the previous statute, which was somewhat vague and often ambiguous. Under the old law, a physician against whom a complaint was filed could easily avoid punishment because of legal technicalities. With increasing attacks on the medical profession and its alleged shortcomings, it is certainly important that this new law be made to work.

Peer review is only effective when those involved approach problems with an open mind. The medical profession is one of the few, if not the only one, that consistently practices self-criticism. Accordingly, tissue committees and scientific and research activities have been established to seek better ways of approaching medical problems.

With the spotlight on the profession as it is today, it becomes the responsibility of the members to root out the small percentage of offenders that malign the medical field. Although this consists of only an estimated one half of one percent, with the help of the Commission on Medical Discipline, this can hopefully be reduced to zero.

John Sargeant

Legal Aspects of As They Affect

The Medical and Chirurgical Faculty, in cooperation with the Joint Medicolegal Committee of the Maryland State Bar Association, presented two sessions of a symposium designed as a continuing dialogue between the medical and legal professions to discuss a topic of mutual concern—malpractice suits. The first session was held in January 1969, wherein a panel of physicians presented their views on the medical aspects of malpractice suits for the Bar Association. In April, a panel of lawyers discussed the legal aspects of the problem as they affect the practice of medicine, before a similar group comprised, this time, of physicians. Included in the sessions were such topics as informed consent, record keeping, legal liability in the training and supervision of interns and residents, and the treatment of minors.

Judge George D. Solter, of the Supreme Bench of Baltimore City, introduced the physicians at the January session.

"This is the chance for the physicians to tell it like it is to the lawyers. Although it is in no way intended to be an argument in rebuttal, it is intended to present the viewpoint of the two professions on the subject of mutual concern.

"I can think of no more provocative subject for the two professions to discuss than the question of malpractice and its impact on the practice of medicine and, by virtue of the corollary, its relationship to the practice of law by negligence and tort lawyers. No greater question faces the two professions.

"As we all know, the increase of malpractice claims in recent years has been rather substantial. While it must be recognized that a physician be held civilly accountable for any neglect on his part in his practice of medicine, it must always be remembered that the lawyer has a duty to investigate, listen to, and study a potential malpractice claim before he pursues it, and make sure that his client's claim is in fact meritorious and actionable. The frivolous claim can cause irreparable damage to the physician, resulting in wasted time, money, and effort for the lawyer, and disappointment for his client.

"There are many reasons for the increase in the number of malpractice suits. It is hoped that during these sessions, these reasons will be presented and clarified, and that many pertinent questions on the subject will be raised and answered by the members of the two panels."

Malpractice Suits

the Practice of Medicine

Howard F. Kinnamon, MD, introduced the speakers for the second Medical-Legal session in April. Dr. Kinnamon is a member of the Faculty's Medicolegal Committee.

"This is the second meeting of the Medical-Legal group. This time we have a panel that will represent the legal aspect of the problem to members of the medical profession.

"Several important points which should be brought to light include the statement that no physician has really suffered as a result of a malpractice suit. Exceptions are such instances as the young physician who is presently suffering from a severe case of bleeding ulcers as a result of a persecuting malpractice suit.

"Although monetary damages are most frequently awarded to the patient, a certain percentage of the money is collected by the lawyer for his services to the patient.

"Another important point is the inequality that exists in the two professions. While a physician is expected to tell his patient of any possible problems or complications that may result from the physician's treatment of the patient (and this may lead the patient to seek another physician) a lawyer has no such problem. Not many complications would arise as a result of the patient's filing a malpractice suit against the physician, since the patient (and the lawyer) have nothing to lose, but all to gain.

"Also, there is another important difference here. If a group of lawyers (the Supreme Court, for example) reached a unanimous decision on an important issue, one would wonder. But if a similar group of physicians could not agree on the best course of management for a patient, certainly one would be most concerned.

"The physician should not be bothered by nuisance cases. Once again, the physician is faced with the responsibility of defending himself and his practice. Certainly, the physician does not deserve such persecution for such small-scale complaints.

"Since many physicians do not live up to their responsibility in setting the standards for their profession, it often becomes the jury's duty to do so. It seems that often a lawyer prefers to keep his problems with his client within a jury so that he does not have to go to a panel of physicians for an opinion. What does the lawyer have to lose by allowing the patient to come to the medical profession for an opinion?"

The following papers were presented during the January and April 1969 sessions of the Medical-Legal Symposium.

From the Physicians' Point of View . . .

MALPRACTICE

from the Private Practice and Institutional Psychiatric Viewpoint

JOHN M. HAMILTON, MD
Superintendent
Clifton T. Perkins State Hospital
Jessup

There was a time when all of the fears and concerns about physician malpractices could be conveniently stored in the stock phraseology learned by every medical student in a course possibly labeled "Medical Jurisprudence 101". This phraseology generally went something like, "A physician may not be considered negligent or otherwise guilty of medical malpractice if, in the course of his examination and treatment, he demonstrates that he has acted up to a standard of performance of the reasonably prudent physician licensed to practice in his community." Malpractice has subsequently become a much more complex area of concern and, just how much more complex, is indicated by these two examples which are quoted verbatum:

"Civil Suit Won in Murder Case: Psychiatrists Ruled Negligent [1]

"An unusual compensatory damages award, which may have far-reaching consequences in the question of psychiatrists' responsibility for their psychotic patients, has been made in a federal court in North Dakota.

The court ruled that two psychiatrists and a psychologist at the Veterans Administration Hospital at Fort Meade, S.D., had been negligent in failing to control a patient who subsequently murdered his wife.

Testimony in the case indicated that Mr. William B. Newgard was committed to a state mental hospital in January 1965 and later transferred to the Veterans Administration Hospital. Authorities permitted him to leave the hospital on one occasion to attend a funeral despite objections by the patient's wife, who feared harm from him. She had him seized and returned to the hospital.

Subsequently, hospital authorities decided to find work for the patient outside the hospital in preparation for his release. Again his wife objected, in a telephone conversation with a staff psychiatrist, contending that the patient was dangerous. However, the hospital completed the arrangements for outside work, although it claimed that it had restricted the patient's movement so that he could not see his wife. Shortly after beginning work, the patient drove to his former home and shot his wife to death.

Suit was brought in federal court by the administrators of the wife's estate on behalf of her children, charging the hospital with negligence. The court, sitting without a jury, awarded $200,000 to the estate.

U.S. District Judge Ronald N. Davies ruled that hospital authorities were negligent in a number of actions and omissions. A psychologist was found to have failed to exercise reasonable care by not making certain that the outside employer was aware of the circumstances and the need for restrictions on the patient's travel and activities. The employer had testified that he had assumed that the patient was free to come and go as he chose.

The psychiatrist who had spoken with the wife when she telephoned to object to the patient's impending release was found negligent for having failed to make notation of the call and for having failed to pursue the matter further.

Another psychiatrist, who had treated the patient and conferred with his wife on several occasions, was found to have "ignored and rejected every warning signal" that the patient was dangerous and that the patient's wife "had every reason to be in mortal fear of her husband." The court commented that "had (the psychiatrist) devoted more of his time and talents to Newgard and less of them to diagnosing Newgard's wife, conceivably she would never have met so tragic and untimely a death."

A Fargo, N.D., psychiatrist commented to PSYCHIATRIC NEWS that the case "would appear to set a precedent" for the ways in which employees of the hospital were found negligent. The Veterans Administration is expected to appeal the ruling."

"$200,000 Award Points up Widening Malpractice Liability" [2]

"A $200,000 malpractice award by a White Plains, N.Y. jury has far-reaching implications for all physicians, according to medicolegal experts. For one thing, it demonstrates a fact many practitioners may not know: A doctor can be held liable for an injury to someone he has never treated.

Another unusual aspect of the case was the type of malpractice charged—failure to restrain a mental patient. Such accusations have become increasingly frequent in the past three years and, the experts believe, could well be brought not only against institutions and psychiatrists, but against other doctors as well. In addition, the amount of the award is a warning to doctors, particularly in rural areas, to review their malpractice insurance coverage.

The White Plains case involved Silvio Provenzano, who had been committed to Grasslands Hospital, a county institution, as a paranoid-schizophrenic after having been charged with assaulting his wife. Following an uneventful stay at Grasslands, Provenzano was transferred, at the request of his family, to Halcyon Rest, a nearby private hospital. After four months unmarked by incident, he was discharged.

In the meantime, Provenzano's wife had obtained a court order requiring her husband to support her. When he defaulted, she retained Joseph A. Vassalo, a Harrison, N.Y., lawyer, to collect. Vassalo contacted Provenzano soon after his release from Halcyon Rest, and Provenzano agreed to meet him to work out details for payment.

Lawyer Bitten by Defendant: At the conference, attorney Vassalo later testified, Provenzano appeared normal. Then, without warning, he suddenly leaped across the desk, seized the lawyer with both hands, bit off the lower half of his nose, and fled. Provenzano was later convicted of assault and battery and was sentenced to three years, most of which he served in the prison hospital.

Meanwhile, Vassalo brought a malpractice suit against Grasslands, Halcyon Rest, and Dr. Alexander Carlen, Provenzano's psychiatrist at Halcyon, charging all three defendants with failure to confine and supervise a dangerous mental patient. As a result, the suit claimed, Provenzano had been free to come to Vassalo's office and, in the words of a medical expert, cause "a traumatic amputation of the lower half of the lawyer's nose."

By the time of the trial, Vassalo had spent eight months in various hospitals, had undergone ten plastic-surgery operations on his nose, and had incurred $22,000 in medical bills. Although he admitted the cosmetic result was as good as he could have expected, he testified that he had no feeling in the nose and often could not breathe properly through it.

In addition, Vassalo charged that the incident had harmed his law practice, social life, and family relationships. Also, because he lived in a small town, he argued that his personal suffering and humiliation had been intensified—to the amount of a quarter of a million dollars, he urged upon the jury.

After the trial judge had ruled valid Grasslands' defense that it could not be held responsible for a patient who had been transferred to another accredited hospital, the jury brought in an award of $200,000 half to be paid by Halcyon Rest and half by Dr. Carlen. The trial judge refused to set the judgment aside, and neither defendant appealed the decision.

Vassalo was never a patient of Dr. Carlen, was never confined to Halcyon Rest, yet he successfully sued both. Still the case is not unique. Many courts have held physicians liable if their failure properly to diagnose infectious disease, for example, has caused uninvolved third parties to contract it. And mental institutions have often been adjudged negligent for failure to restrain or supervise patients. But the Vassalo case marks the first time that a private practitioner has been liable for injury inflicted by his mental patient."

These examples indicate the broadening base from which malpractice suits are contemplated and adjudicated. The indications are that both the private practitioner in psychiatry, the psychiatric administrator of a hospital facility, and psychiatric and general hospital staff physicians have to take much more care in the management of their practice and the carrying out of institutional responsibilities in order to meet the reasonable expectations of the community in relationship to quality as well as quantity of medical care.

In this presentation, I intend to cover, meaningfully, malpractice implications as related to psychiatrists' responsibilities both institutionally and in private practice:

1. relative to patients' records—privilege and confidentiality;
2. permission in procedural examinations and treatments, and informed consent;
3. institutional and office safety standards—patients' and employees' injury;
4. psychiatric emergency and the medical emergency in a psychiatric setting outside the general hospital;
5. delegated responsibility for patient coverage by the private practitioner, and in institutional coverage settings;
6. standards of medical care as reflected in anticipated court prescription and supervision of psychiatric evaluation and treatment;
7. the area of clinical judgment as reflected in the disposition of the dangerous or suicidal patient regarding his release or detention, and the probable liability implied, and death—the institutional and private practice responsibility.

Patients' Records—Privilege and Confidentiality

I have purposely begun with a priority devoted to the hospital or institutional medical record and the private practitioner's record of examination and treatment because so much of what is subsequently validated and adjudicated depends upon the accuracy, appropriateness and adequacy of documentation, and the manner in which the physician or institution guards patient privilege and confidentiality. I can quite well remember how the importance of records was impressed upon me by my clinical professor in obstetrics and gynecology, who had two general administrative maxims in the administration of his department; both of which go to the heart of general malpractice matters we are discussing today, and one of which is particularly meaningful in the area of records. In many conferences in the department, I, along with other residents, would frequently describe procedures which had been done and the results which had been achieved only to have the professor call for a look at the record, following which we would receive a lecture revolving around why we had not reduced this previous recitation to writing. His maxim about this was simply, "work not written is work not done." In essence, this is the importance of records. We have little to fear in the malpractice area, generally, if we have meticulously prepared written accounts of our professional behavior in relation to the particular patient involved. Records should serve to reliably account the history, findings, diagnosis or diagnoses, and the prescribed treatment along with the follow-up response to treatment, and a documentation of any significant events which occurred in the realm of the private practice supervision of the patient, or in the realm of his hospital management. The language used should be the language which properly portrays the full meaning of our evaluative and treatment interventions, with all of the relevant variables indicated and described.

There are several kinds of records which are a part of the official institutional medical record in a psychiatric setting and, of principle concern to us are those records validating the commitment status of the patient (commitment certificates, court orders, requests for commitment and treatment of a voluntary nature, etc.); psychiatric and social case studies, psychological tests, protocols and interpretive reports, special clinical and laboratory test reports and tracings; identification data; progress notes by medical and nonmedical staff; special incident reports; staff conference notes and summaries; discharge and dispositional summaries; etc. It is important that the compilation of these reports represents no essential conflict of vital information. It is also important that the recorded information is as accurate as can be circumstantially possible. All conclusions, interpretations, diagnostic and dynamic formulations, and treatment prescriptions should be soundly based on objective findings relative to the particular patient involved. Speculations, which are unfounded in sound psychiatric knowledge, and specific findings, relative to the patient at hand, should be assiduously avoided.

There was a time in our state when the patient privilege between psychiatrist and patient was not protected by statute. This has recently been statutorily corrected and psychiatrists in private practice, who had previously denied the existence of records for legal purposes, can now admit that they have them without fearing abuse. There are some conflicting views, however, about the general extent of patient privilege and, to just give you extremes, I cite two decisions:

"Calling Psychiatrist as Witness Waives Privilege" [3]

> "In a prosecution for armed robbery in which the defense of not guilty by reason of insanity was raised, a trial court properly permitted a psychiatrist to testify as a rebuttal witness for the prosecution, over the accused's objection of vio-

lation of the psychiatrist-patient privilege, an Illinois intermediate appellate court ruled.

The accused called as a witness in his behalf a psychiatrist who had examined him two weeks before the crime. He stated the opinion that, on the date of the crime, the accused lacked the ability to appreciate the criminal nature of his act or conform his conduct to the requirements of the law. The prosecution then called as its witness a psychiatrist who had examined the accused at about the same time as the accused's witness, as well as three months earlier. The prosecution's witness stated the opinion that the accused was legally sane at the time of the crime.

The prosecution had the burden of proving that the accused was sane at the time of the crime.

By calling the psychiatrist to testify in his behalf, the accused waived the psychiatrist-patient privilege as to the psychiatrist called by the prosecution.—*People of the State of Illinois v. Givans,* 228 N.E.2nd 123 (Ill, May 8, 1967)"

"Insanity Defense Not Waiver of Physician-Patient Privilege" [4]

"In a prosecution for murder in which the defense of insanity was raised, a trial court erred in permitting a psychiatrist who had treated the accused at a state mental hospital after the offense to testify as to his sanity, the Minnesota Supreme Court ruled. The conviction was reversed and the case remanded for a new trial.

Following the killing, the accused was examined and found to be in a state of insanity which made him incapable of understanding the criminal proceedings against him and cooperating in his defense. He was committed to a state mental hospital.

When he regained his sanity, he was brought to trial. Over the accused's objection, based on the physician-patient privilege statute, the psychiatrist who had treated him at the mental hospital was permitted to testify that, in his opinion, the accused was legally sane at the time of the killing.

The physician-patient privilege statute makes no distinction between "public" and "private" physician-patient relationships, and no reasonable basis exists for making such a distinction. It is the patient who is the beneficiary of the privilege, and it should make no difference whether he is a "private" or a "public" patient. This is especially true with respect to state mental hospital patients, where complete confidence in the attending physician is indispensable to the cure.

The accused did not waive the privilege by asserting the defense of insanity or by presenting the testimony of four physicians who had treated him before the killing. The four physicians expressed doubts as to his mental capacity but had no definite opinion as to his legal sanity. The statute clearly provides that a physician shall not disclose without the patient's consent any information or any opinion derived from the patient while attending him in a professional capacity.

The accused refused to submit to an examination by a psychiatrist for the purpose of qualifying him to testify as an expert witness. He had the constitutional right to refuse to submit to such an examination. His refusal to submit to an examination and his consistent objections to the psychiatrist's testimony completely refuted the giving of consent, either express or implied.—*State of Minnesota v. Fontana,* 152 N.W. 2nd 503 (Minn., July 28, 1967)."

Permission in Procedural Examinations, Treatments, and Informed Consent

Most private practitioners and most institutions have for many years extracted from patients, or responsible relatives, blanket permissions to engage in a universality of evaluative and treatment practices. Malpractice suits have caused quite a departure from this relatively well-established policy in most institutions. Now, most of us require special permission forms approving each individual evaluative or treatment procedure if it involves anything that may, in the least, be considered potentially dangerous or harmful as a side effect in its achievement. We are all familiar with the extent to which a practitioner's malpractice insurance premium rises with his involvement in the special procedure area. A psychiatrist who either administers electroconvulsive treatment, or supervises its administration by staff physicians, or residents, generally has a substantially higher premium rate than one who does not. This, of course, brings in a sidelight of the extent of a physician's responsibility when one is involved in a supervisory capacity—administratively or in a teaching supervisory capacity—and how this affects his personal liability for what happens to patients under the direct care of those supervised. It would seem that, currently, to be on the "safe side," physicians in administrative and supervisory functions have to be extremely concerned about the nature and quality of their interventions as it directly affects the care of patients.

For those of us who are at work in institutions where federal assistance, grants, or fellowships provide financial support, we are all too familiar with the essential ingredients of informed consent. We have been required, in the area of federal fund participation for research and treatment programs, to indicate that we will universally deal forthrightly with patients in regard to informed consent. This means that prior to a patient's approval of his participation in a particular examination or treatment, he must have explained to him the possible, as well as the probable, outcome of the examination or treatment procedure

and it must be ascertained by the treating physician, or his delegatee, that the patient understands that about which he has been informed.

Institution and Office Safety Standards—Patients' and Employees' Injury

We are all familiar with the general safety standards which the Joint Commission on the Accreditation of Hospitals has approved under its codes for institutions, and we are familiar with the general office standards which are imposed upon us by insurance companies that write liability insurance for personal injury. The increase in malpractice suits and judgments against institutions and individuals in this area seems to have caused institutions and individuals to adhere to a safety standard of excellence which might be beyond reproach. This has been, I think, a valuable outgrowth of the many malpractice cases in this area, though for some institutions it has added considerable operational expense, in the form of inspectors and maintenance of personnel, to achieve and maintain the degree of safety required to insure against personal injury of both patients and employees.

Psychiatric Emergency and Medical Emergency in a Psychiatric Setting Outside the General Hospital

In a psychiatric setting, where physicians, both trained and untrained, are primarily psychiatrically oriented, there is a danger that the basic physician identity may be somewhat sub-tended by one's interest and concern in the speciality area. To this extent, the psychiatric practitioner may be tempted to become lackadaisical and cursory in his application of standard and generally accepted physical-medical principles to the psychiatric and medical emergency which occurs in an area for which he is responsible, or to a patient in his care. Though most psychiatric hospitals provide proper medical speciality care by qualified consultants, or even full-time staff members, these persons are not always at hand to manage the emergency. The fact that one is a psychiatrist does not relieve one of general medical responsibility, as long as one is a licensed practicing physician, especially when an emergency situation arises.

Delegated Responsibility for Patient Coverage, etc.

Physicians generally have, long ago, discovered the advantages to be reaped in involving themselves in group practice with other members of their particular medical speciality, as well as with those of diversified specialities. This insures that, upon one's absence, patients are left to the care of competent practitioners in whose judgment one has some faith since one's responsibility is likely to continue, even during the period of absence, under many jurisdictional rulings. The problem of proper patient coverage, then, is a significant one both in private practice as well as institutional practice. The burden of responsibility of patients' medical care and their behavior while under treatment, either as an outpatient or as an inpatient, is a relatively tremendous one which has many pitfalls. Institutional coverage circumstances are particularly suspect in this area. It is the usual practice in psychiatric settings to have a full staff of physicians available during what is termed the administrative day, which might last anywhere from 7:30 AM to 5:00 PM, and variations of these hours of coverage; and, to have Officers of the Day or Night Duty Officers responsible for the patients in the setting for the remainder of the hours. Often these physicians are not actually physically present during the off-hours and may, in some instances, only be reached by phone in case of an emergency. Numerous problems have arisen in this gray area of medical coverage responsibility. I foresee the day when either malpractice pressures, or the supervisory pressures of the court, unsolicited by malpractice endeavors, will change our administrative practice and philosophy in this area.

Standards of Medical Care as Reflected in Court Prescriptions, etc.

The courts in certain jurisdictions have become extremely interested in the level of medical care as purveyed particularly to patients who are housed in psychiatric settings. The critical question seems to be whether patients in such settings are primarily deserving of a particular standard of treatment as a right, or whether this is a privilege to be given to some and denied others, either whimsically or for some other reason. The United States Court of Appeals for the District of Columbia, where Judge David Bazelon is the Chief Judge, has been particularly outspoken in this area recently. The following is an excerpt from a case:

> **"Rights of Mentally Ill Patients"[5]**
>
> *"Mental Hospital Patient*
> *Entitled to Adequate Treatment"*
>
> "A man involuntarily committed to a mental hospital, after being found not guilty by reason of insanity of a charge of carrying a dangerous weapon, had a right to adequate treatment, the U.S. Court of Appeals for the District of Columbia Circuit ruled. The right was held enforceable by means of habeas corpus.
>
> The Hospitalization of the Mentally Ill Act specifically provides that a person confined to a public mental hospital is entitled to medical and psychiatric treatment and care. That provision applies to all patients, without regard to the statutory authorization for their commitment to the hospital.
>
> The trial court had refused to consider the pa-

tient's contention that he was receiving no psychiatric treatment at the hospital, ruling that its jurisdiction was limited to the determination of whether the man had regained his sanity. The appellate court remanded the case to the trial court for a hearing on the adequacy of the care and treatment being furnished to the man by the hospital.

The hospital would not have to show that the treatment being provided would cure or improve the man's condition, but only that a bona fide effort to do so was being made. Thus, the hospital would have to show that periodic inquiries were made into his particular condition and needs and that he was provided with treatment suited to the condition and needs. The treatment provided should be adequate in the light of present knowledge. A continuing failure to provide suitable and adequate treatment cannot be justified by lack of staff or facilities. —*Rouse v. Cameron,* 373 F,2d 451 (C.A., D. of C., Oct. 10, 1966; as amended, April 4, 1967)."

It would seem that institutions which indicate that their existence is a therapeutically rehabilitative one, rather than a custodial one, will be forced to demonstrate an acceptable standard of excellence in delivering proper evaluation and treatment.

Area of Clinical Judgment as Reflected in Anticipated Court Prescription, and Supervision of Psychiatric Evaluation and Treatment

Near the beginning of this presentation, I quoted a case which resulted in a $200,000 malpractice award in which psychiatrists were ruled negligent because of certain errors of omission and commission reflecting upon their clinical judgment in the management of the potentially dangerous patient. This is an extremely nebulous area and may well turn out to be the most important malpractice area in psychiatric practice. Just how much can be expected of the clinical practitioner as a predictor of human behavior cannot be clearly outlined with our current level of psychiatric knowledge; yet, in an area where the guidelines are so unclear, we are likely to be held 100% responsible. The institutional death, either from natural causes, self-inflicted or the result of attack by other patients, or injury, always presents a problem. This leads us full-circle back to the beginning of the presentation and the responsibility for accurate and reputable report of incidents and circumstances surrounding whatever transpires relevant to a patient's management while institutionalized. The successful suicide of an inpatient, or an outpatient, is the cause for particular concern since this is an area in which our relevant prediction is good, but our ability to prevent remains relatively poor.

Conclusion

I have sketched briefly some of the many areas of administrative and private practice concerns in the matter of malpractice liability. Though space has not permitted a comprehensive development of all of the sub-topics, it is my hope that bringing them to your attention has proved informative and provocative.

Perfection Of Standards, And Informed Consent In Preventing Malpractice Suits

PAUL E. HUFFINGTON, MD
Peninsula General Hospital

To illustrate the impact of medicolegal decisions on the practice of medicine, I can think of no more vivid case than one tried a decade ago in Ireland. The plaintiff was given a spinal anesthetic for surgery. Subsequently, there was temporary residual neurological damage to the bowel and bladder. The plaintiff sued and recovered. Since that case, virtually no spinal anesthesia has been given in Ireland. There, the patient is no longer afforded the full medical services of the anesthesiologist. There are no more saddle blocks for obstetrical delivery. There is no more spinal anesthesia for the poor-risk patient needing emergency surgery, such as the patient who has just eaten, or the patient who has had a recent myocardial infarction, in whom the mortality rate approaches 100%. In Ireland, the anesthesiologist feels that he hasn't a fair chance with the law.

In the case cited, spinal anesthesia was not proven unsafe, for indeed, if properly used it is not. It was not proven that the defendant used the technique improperly; rather, there was testimony from the surgeon present that the technique was ordinary and responsible. The evidence in this case was based on possibility. Evidence was introduced stating that the soaking of the anesthetic solution ampule in carbolic acid in order to sterilize it possibly could have led to an influx of the carbolic acid through a minute pore in the glass ampule into the anesthetic solution, thereby poisoning it. This contamination would not be detectable by visual inspection, nor by any ordinary means. The anesthesiologist was told that day that ordinary prudence wasn't good enough; any damage resulting from his act would make him liable, and that the act of performing a standard procedure would render him at peril for all consequences following thereafter. And so the standard of care was elevated to near perfection and damage was presumptive evidence of negligence.

We physicians feel that proximate cause must be retained in the proof of malfeasance and must be the crucial point in the trial. The other essentials, namely the duty owed to the patient and the damage, are already self-evident, and we are seeing the erosion of the law when the emotionally charged area of the patient with damages is adjudicated. We ask only that negligence be proved, not imputed.

The Physician's Responsibility

A secondary area of controversy is the responsibility of the physician to inform the patient. Failure to inform the patient of his diagnosis and the consequences of that diagnosis constitute a cause of action for malpractice, if damage follows. There is no argument to this basic medicolegal responsibility. To what extent, however, is this duty to inform to be extended? Many decisions have shown us that there is no limit to the detail that is required of us legally. It is apparently not enough to make a diagnosis and prognosis, and then to so inform the patient. The decisions illustrate that we must inform and, indeed, warn him of all complications, even the most unlikely, that follow our course of treatment. In the field of therapy or anesthetic administration, we are especially liable, for here we are doing something to the patient. When we actively do something and damage follows, the patient naturally says, "If I had known this could happen, I never would have consented." We are then defendants in a suit because we failed to inform the patient of all of the complications of anesthesia. It reminds me of the wise old farmer who always said that if he knew where he was going to die, he'd never go near the place. If I were to make rounds and to adhere to my duty to inform, carried to what I consider an extreme, it may go something like this:

"Good evening Mrs. X. I am Dr. Y., an anesthesiologist. The nurse tells me you are somewhat apprehensive about your forthcoming anesthesia tomorrow. I hope that I can answer your questions and reassure you that from our viewpoint everything looks fine for tomorrow. I will tell you exactly what we are going to do so there will be no mystery. I will give you several pills in the morning that will take the edge off of your nerves. You will then be brought to the operating room where I will see you. We will put a blood pressure cuff on your arm and a needle in your vein. I will put you to sleep with thiopental (*Pentothal*). After you are asleep, I will paralyze you with arrow poison curare, and place a tube in your windpipe. I will then use cyclopropane, a general anesthetic, to keep you anesthetized throughout the operation. As you know, you are having your stomach removed, so I will breathe for you throughout the operation, which usually lasts 3½ hours. General anesthetics depress your heart appreciably, affect your liver adversely from three to five days, and halve the blood flow to your vital abdominal organs. The chance of part of your lung collapsing varies from about 10% to 40%, depending upon the literature that you have read. During the operation, I will have to decide how much blood and fluid to give you. Usually, two pints of blood and two quarts of solution are required. At the end of the operation, I will give you some potent medicine that temporarily poisons your enzymes so that arrow poison will no longer be effective. After getting you to breathe on your own, I will remove the tube from your windpipe and make sure you don't stop breathing because of airway obstruction. I will then take you to the recovery room and give you potent pain-killing drugs to prevent your vomiting. I hope by explaining my responsibilities I have set your mind at ease and that you will sleep well tonight."

Even then, I have not told her the risk of each drug, the danger of air embolism, or the possibility of death from vomiting and aspiration of stomach contents, the danger of explosion from the anesthetic; so that I have not really informed her. Literally, I could go on for hours informing her of all the possible complications which might occur.

Informed Consent

You know, it is a good thing that informed consent is not expected of the airline pilot. When we get on an airline and fly to the Pacific Coast, the pilot does not come over the intercom and relate to us all the dire possibilities that may happen during the flight. We are presumed to know that air flight is safe but that planes do crash. We are presumed to know, and we think that our patients know that anesthesia is safe in general, but that there are com-

plications and morbidity and mortality. We feel that they have agreed, either expressly or impliedly, to place a trust in your ability to land safely, as far as the anesthetic venture. Many patients do not want information. We come in contact with a large group of patients who, when we walk in the room, tell us, "Don't tell me a thing. I don't want to know anything about it. Do what you have to do. I just want to be asleep." Gentlemen, we want the same law applied to us that is applied to other persons charged with the lives of others.

I have been told by many attorneys that the operative and anesthetic consent is not worth the paper it is written on. We wonder why this should be. Why can't a general consent for surgery to be performed and the anesthetic to be administered be valid, if the patient so agrees. Instead, every attempt is made at trial to show absence of consent because every detail was not presented to the patient. We ask that our operative permits be respected legally. If there be fraud in obtaining them, then let it be shown and the fraud will avoid the consent. But fault should not be found with the physician who obtains the permit in good faith. We ask, then, that our operative permits be construed strictly so that, again, he who consents cannot be legally wronged.

Rising Medical Costs

The impact of decisions on the cost of medical care is considerable. I shall briefly mention several examples. In the operating room, we see medically needless X-rays of surgical operative sites—medically needless, but extremely necessary in the eyes of the surgeon. The X-ray is his only objective defense against a malpractice suit, should damage ensue. He is practicing defensively rather than as a free agent. This delay in the operating room is passed along to the patient as increased X-ray fees, operating room fees, and anesthesia fees, and perhaps even increased morbidity and delayed convalescence. If we could stop practicing preventive law, we could lower the cost of medical care considerably to these patients.

In the State of California, my colleagues in radiology inform me that deep X-ray treatment of cancer is all but nonexistent except in the large medical centers. The hardship of a cancer patient having to make repeated long trips for treatment at the major centers is unnecessary. But to the therapeutic radiologist, the legal hazards of administering high voltage treatment are such that only the state institutions can afford the legal consequences. The result of legal decision, here again, has told the therapeutic radiologist that he is in danger when using such an instrumentality.

The medical liability of the pharmaceutical manufacturers has resulted in a distinct detriment to sound drug therapy. Current brochures which accompany a given drug are given more legal weight, as evidence in a court of law, than the judgment of specialists or pharmacologists using the drug. Such brochures are loaded with absolute, relative, and ethereal contraindications such as; Drug X may be contraindicated in certain cases of possible liver disease. Such a warning is medically meaningless but is devastating on the witness stand when read to the jury in a damage case. Such brochures have been worded so as to remove any liability for breach of implied warranty by the manufacturer. If aspirin were an investigational drug at present, it would take about three years to be cleared by the Food and Drug Administration. Its brochure could say that it redisposes to gastric irritation, peptic ulceration, bleeding tendencies, and metabolic acidosis, all of which are true. In addition, 50 persons die in the United States each year from aspirin anaphylaxis. So even the safest drug is not without lethal potential. There is no way for the physician to know what the results of a given drug to a given patient will be. To hold him liable for rare or abnormal responses to a drug is punitive indeed. Yet, this is the position we find ourselves in. Because we are the ones who started doing something to the patient, it all seems to rebound to us, whether damage, indeed, is shown or not.

Conclusion

Space obviously does not permit discussion of the locality rule, *res ipsa loquitur*, or the reluctance of specialists to delegate responsibility to their agents—and this is a pressing problem—the nurse anesthetist, for example. Time has not permitted the discussion of the beneficial effects of law upon medical practice. We have mentioned only several broad areas of controversy in hopes of stimulating further thinking and understanding. And although it may sound as though I am overcritical of the law relating to medical practice, nothing could be further from the truth. The body of Anglo-Saxon common law which we have inherited and modified to fit the new world is, in my opinion, the greatest collection of equity the free man has ever known, and the legal profession is the guardian of that body of law. We physicians ask only that these legal principles be construed strictly as relating to medical practice so that remote cause does not come to replace proximate cause in tort actions; so that the operative permit is indisputable evidence of consent; so that damage is not presumed to be negligence; so that the physician is not held to a standard of care of near perfection, but is held liable only as the mortal scientist and practitioner that he in fact is.

This is an age of progress,

an age of hope.

It is an exciting time.

Truthfully, we as a society

have accomplished more in the past 25

or 30 years than in all of recorded history.

THE IMPLICATIONS

But, one of the fundamental problems

that faces our society today is

our inability to put technological advances

on a par with human advances,

and, as a result, we are faced with the problems of medical malpractice.

Malpractice is simply a consequence of our inability to keep up with technological progress.

OF MALPRACTICE SUITS

B. MARTIN MIDDLETON, MD
St. Agnes Hospital

Malpractice is not all bad, and it has brought about some beneficial results. First of all, there is a far wider dissemination of knowledge today than ever before, and consequently, the patient is better informed than in the past. He is now participating more in the care that he receives. Today's patient wants a physician who is involved in his care and treatment, and we as physicians, as professional people, must involve our patients in the care that we render. The physician as an overprotective father image of the past does not belong to today's world. Our problem as physicians is our failure to recognize that our patients are so informed.

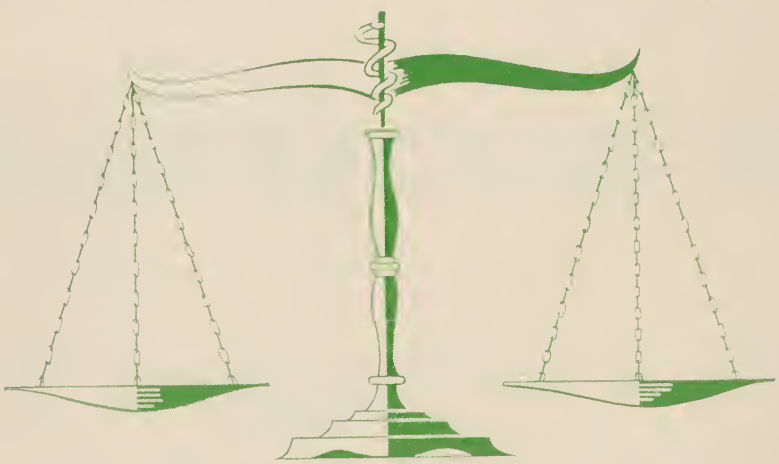
Also there is a much greater emphasis on professional competence today. Malpractice, either directly or indirectly, has led many of us physicians to attend medical meetings. It has forced us into a greater realization of our responsibilities as professional people. It has made us more aware of our ties to our professional organizations, and to be a member of these professional organizations implies, and indeed almost requires, increased competence.

Certainly, malpractice has been a boon to preventive medicine. Today, I can say to my patient, "I suggest and advise you to have a certain series of X-rays." She says, "Well, doctor, I can't afford it; I don't want to do it." I could say, "Okay, I can only advise you; you have to do it; you have to make an effort; I will make the arrangements." And she may say, "Well, I don't want to do this." Again I say, "Well, I will write it down here in the note, and if something happens six months from now, you can't come back and say I didn't warn you." This causes many people to take the care which they would otherwise not take, because frequently when it becomes the patient's responsibility, he will accept it. We are no longer the father figures of the past.

So much for the good. What about some of the bad aspects of malpractice? No doubt our patients are exposed to greater anxiety. This has already been clearly pointed out. But, I have also learned from my dealings with people that with a little time and some sincere cooperation, this fear can be greatly allayed. It does force the patient to make more decisions. When he just cannot make these decisions, the physician must force him to do so.

Malpractice has also caused increased suspicion of our system of medical care, and has helped bring about the increased cost of medical care. As for those of you in the legal profession, you must share with us the burdening and increasing role that cost is playing in patient care. You can no longer place all the blame for rising costs on the physician. Every facet of our society is directly or indirectly responsible for the rising cost of medical care.

As for informed consent, I much prefer to see a patient in my office, examine him, listen to his complaints, form an opinion of his condition, have him return to my office to discuss his problem, make a recommendation to him, and then, if the condition requires surgery, perform it to the best of my ability. As far as certain technical problems that may arise, such as indispensable nerves or arteries, I tell the patient that there may be an injury or another unexpected result, but that I will be as careful as possible. Thus, I have informed the patient, but at the same time I have assured him that, as his physician, I am going to do the best within my power.

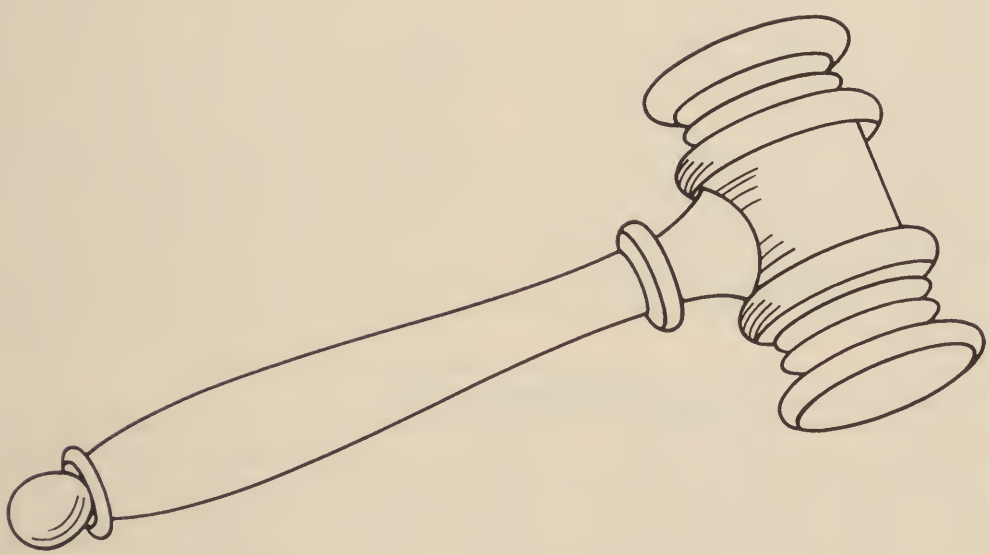


Residency training is a real problem, and the legal profession shares this problem. However, with a patient's initiative, and insurance companies and governmental help, almost all citizens in this country can get good health care, regardless of where they go. This is not the real problem. The real problem that confronts us is the shortage of human clinical material to train physicians and surgeons to deliver adequate health care for the patients of the future. The general public must come to understand and appreciate the capabilities of the resident or intern who is training under the supervision of a competent physician. The concept of team surgery must be strengthened, and the importance of all members of the team must be stressed. This is the only way that we are ultimately going to be able to provide the necessary quantity and quality of physicians to meet our future needs.

What are some of the other impacts of malpractice on medical practice? Malpractice is certainly discouraging young men from entering the private practice of medicine. This is one of the greatest tragedies of our time. The corner physician hardly exists anymore. Patients are now being forced into emergency rooms, being forced into a mere numbers game. Many young men are literally afraid of taking on the responsibility of a private practice.

Medical Economics said that in 1969, one in every six physicians would have a malpractice suit filed against him. No wonder we are losing students to other disciplines. We as physicians are raising our standards of medicine much too high.

Even though the question of malpractice results in unnecessary red tape, it has also brought with it a deeper awareness of the value of medicine, for both the physician and the patient. So, the current challenge lies in being able to prevent malpractice from occurring, and in protecting those physicians who are unjustly accused. This can be done by gaining a better understanding of the bills introduced into the state legislature so that we can set definite guidelines, not only for the physician, but also for the patient and the lawyer as well.



The Lawyers Speak . . .

MALPRACTICE IMPLICATIONS

and the Safeguards in Maryland's Law

JUDGE W. ALBERT MENCHINE
Third Judicial Circuit of Maryland

What appears to be a major problem in discussing the issue of malpractice suits against physicians is the question of whether or not the physician is presented with an accurate picture of the law that governs and controls this litigation. Too frequently, physicians are presented with statements of the pros and cons of the problem—arguments by their advocates, or representatives—that are not the law.

One of the great fears of a physician confronted with a malpractice situation is that the threat of suit, or the filing of suit, will be damaging to his career. As far as I am aware, there has been but one empirical study of this question, the result of which is recorded in the Journal of the American Medical Association **of July 1, 1961. The inquirer included every concluded case in the State of Connecticut over a 25-year period. Cases involving both successful and unsuccessful litigation against physicians were included. The following is an excerpt from the reported study:**

> **"Objectively, the effects of a malpractice suit upon a physician appear to be much less than generally believed. Not one case was found of a physician compelled to give up his practice, and move. No physician lost his license. None were ejected from hospital privileges, staffs, or societies. None were unable to obtain malpractice insurance, although a handful had to switch companies and pay higher rates. None claimed to have suffered professionally, and none suffered socially.**
>
> **"Almost as many reported that their practices improved, as those that reported their practices were injured. In no instance was there a claim that a practice was injured for more than two years. And in these instances, the doctors expressed no dismay at the reduction in their work load. No physician reported any personal financial loss, as the result of a malpractice suit. It would appear that the greatest damages to the doctor who is sued for malpractice are subjective in origin, and it is sincerely hoped that this study of the experience of physicians in Connecticut will provide a reliable standard of what the doctor can expect from a malpractice suit, and will indicate to the medical profession, as a whole, that a view of the malpractice suit has been taken which is too pessimistic. It is my hope that this study will reduce the ethereal to the concrete which can be realistically, honestly, and confidently appraised and mastered."**

This is a report in a distinguished medical journal. It is in accord with my own views—there is not the stigma attached to malpractice cases that physicians think there is.

The courts in many states, and the authors of many articles in many law reviews, have spoken of what is called the "conspiracy of silence". I don't really believe that it is a conspiracy, in any legal sense. Rather, it is a feeling of empathy that the physician feels toward the person who is accused of being negligent in his practice. I suspect that it really stems from an idea of "there, but for the Grace of God, go I". But there can't be any question that it is practically impossible, except in rare instances, for a person who claims that a physician is negligent to obtain the advice and help of members of the medical profession as witnesses in the litigation. Call it empathy, call it a conspiracy of silence, it is there.

The literature of the law makes it clear that certain developments have occurred, and can be expected to continue to occur unless there is recognition by physicians of their responsibility in the area of malpractice suits; that it is morally wrong *not* to testify in favor of plaintiffs, when it is established that negligence exists. (There isn't any doubt that baseless suits against medical practitioners ought to be contested to the very end.) There is nothing more discouraging to a lawyer in the filing of litigation than to be undertaking a hopeless cause in which his labors are futile. Cases of this kind are usually undertaken on the basis of a contingency fee—payment if successful, nothing if unsuccessful.

Legislatures are trying to find some way, other than the testimony of the medical witness, to present the cause of an injured individual who charges negligence. Massachusetts and Nevada, for example, have statutes that permit authenticated articles from medical periodicals, written by established experts in the field, to be presented as evidence to prove the negligence of a physician. Statutes such as these will probably increase in number unless the medical profession undertakes a more active role of "exposing the uneducated, ignorant, and incompetent doctor, who turned loose on a helpless community, is as deadly as a pack of artillery."

There is a growing tendency to permit general practitioners to testify in specialist fields. There is also a growing tendency of the courts to expand the doctrine of *res ipsa loquitor* to extents which courts of two generations ago would not have dreamed. The geographical area of expertise is also enlarging.

In some cases involving particular types of alleged malpractice, the brochures of drug manufacturers are admitted as evidence, of the proper way to administer a drug, as bearing upon the issue of negligence of the physician. The appellate courts of New Jersey, Kentucky, Wisconsin, and California have used the expression "conspiracy of silence" in connection with decisions upon medical malpractice cases.

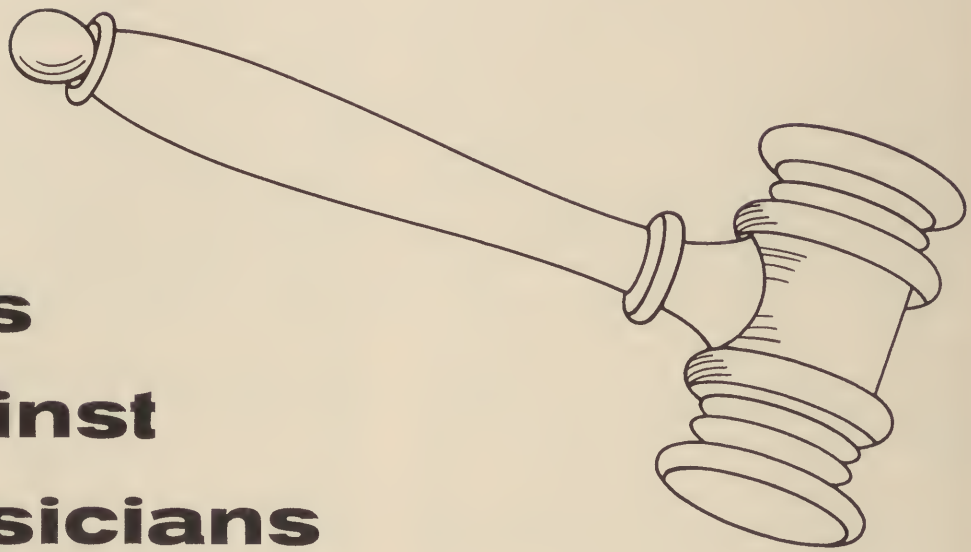
Maryland is a conservative state in this area. The law of Maryland, that deals with the alleged neg-

ligence of physicians, is reasonable and realistic. It accords the medical profession adequate safeguards against the imposition of wrongful suits. Maryland's legislature has acted to protect the physician in emergency situations by the passage of the so-called "Good Samaritan Bill". This bill excuses a physician from any negligence, other than gross negligence, when he treats a patient in an emergency situation. (Gross negligence has been defined by the court as a lack of care so marked as to indicate a wanton and willful neglect of duty.) This should obviate any fear on the part of the medical practitioner in rendering aid in accident cases on the highway. The likelihood of any successful litigation arising from your actions in aiding injured persons of automobile accidents are nil under the Good Samaritan statute.

The suggestion, made by the famous Melvin Belli, that "the real villain of the peace is not the law, anymore than it is the individual doctors, the real conspirators are the insurance companies. Insurance companies wield the whip that keeps medical men silent and in line." This is something I do not believe. I think that the current increase in actions against physicians is hardly indicative of a successful conspiracy in preventing the filing of suits.

I am persuaded that the doctrine of informed consent poses no problem to the Maryland physician. I don't believe that the cases that can be cited (in a number of states) that carry this thing to ridiculous lengths is going to meet with any success in Maryland.

It is encouraging to hear of panels of physicians who review cases of malpractice and follow a course that may lead to their conclusion either by recommending settlement or by urging defense. This is to be expected in Maryland, where, for many years, we have had an active relationship and exchange of views between physicians and lawyers. Even if we do not agree in our philosophies, and certainly in many instances we do not, we at least have an understanding of the position that the other takes, and can act realistically in considering that understanding.



In cases concerning the extension of liability of a physician, the Maryland Court of Appeals, in a proper case, would uphold the liability against the physician on the vicarious liability theory. This would be the case in an operating room situation where the negligence charged against the surgeon would be an act of a nurse, or other assistant concerned with the operation. Surgeons should consider the fair possibility of liability being visited upon them under the theory of *respondeat superior* for the negligence of the nurse or assistant, even though their act, or failure to act was not known to the surgeon in charge in the course of the operative procedures.

A recent, and most interesting case was an effort to assert liability against a physician on the grounds of implied warranty. This was rejected by the Court of Appeals on the theory that, generally, actions against physicians are consensual in nature and that they do not involve implied warranty. Therefore, negligence must be shown. And the negligence that is required is the lack of standard and customary procedures used by other physicians in the State of Maryland under the same circumstances. This is a fair test by which the actions of a physician should be judged. The courts of Maryland are very careful to require a showing of negligence and that this negligence was the direct cause of the disability from which the individual suffers. It has been repeatedly held that *res ipsa loquitor* will not apply. That is, the mere showing of the existence of harm will not give rise to a presumption of negligence on the part of the physician, but negligence must be proven.

It is important to justice that the medical profession take a stand, in proper cases, for the rights of an injured plaintiff who has suffered as the result of negligence of a physician. Expert testimony is required in a vast number of malpractice cases and such testimony is a means to an end in the search for justice. When an expert is persuaded that harm has been done to an individual by the negligence of the physician he should testify in court. And there should not be any organized restraint placed upon the *offer* of such testimony.

It is the suit that is irreparably damaging to the physician and to this, that is the mere filing, there is absolutely no defense. This defenselessness to injury is one which physicians do not believe the Bar by-and-large fully appreciates and I will, therefore, set forth certain aspects of the effect of suit with the hope that with an awareness of these results, members of the legal profession will exercise exquisite professionalism before filing a suit against a physician.

Suits Against Physicians for Professional Negligence From the Defendant's Point of View

JOHN F. KING, ESQUIRE
Counsel for the Faculty

Professional Attitude Sullied

The first effect is not unmixed with others which are later considered, but it deserves individual and special mention. The physician who has been sued once has an outlook to everyday professional services rendered to any patient which can no longer be maintained solely with a pride in the nature and quality of his treatment and care. After a suit has been filed, the physician's professional view becomes colored, tarnished with the outlook: "do this according to the book—or else . . ." I have heard physicians say that after suit was filed, their entire professional atti-

tude has changed. The Tender Loving Care (TLC) elements, so essential to the realization of the nonmaterial rewards in the profession, suddenly seem out of place. The medical profession does not, for instance, condone the physician who shies away from an emergency case, but the reason why he does shy away is often found in a previously filed, unwarranted lawsuit.

Physician-Patient Relationship Strained

The second effect is like the first and no less important. The physician, once sued, may thereafter view each patient as a potential enemy, so that every step in the treatment is fraught with the decision: "Is this in the best interest of the patient, or must I do, or not do this for fear of being sued?". This decision-making is necessary, because unfortunately, the issues presented by the question are not always compatible with the same answer of good medical care. For example informed consent, a burgeoning principle under which suits are presently being filed against physicians, may now press a physician to disclose a malignant condition to a patient when such disclosure may not be in the best interest of the total welfare of that patient.

Recently, in the Maryland Legislature, a physician was asked, "Even where the drug Chloramphenicol is the only drug to combat what would otherwise be a fatal infection, ought not the doctor tell the patient that in one out of a million cases the patient may develop aplastic anemia?" In other words, scare the patient to death, rather than exercise a professional, responsible judgment.

The Standard Of Medicine Is Not Enhanced Or Elevated

Many attorneys, and lay people as well, claim that if the threat of suit were not present, the patient would not be as well cared for. This frightful contention is based on the premise that good medical care is rendered by the physician only to protect himself. The point of view is totally devoid of any recognition that physicians are healers called to pursue the art out of a desire to cure and comfort the sick. The threat of suit deters them in this endeavor—it does not assist them. Many procedures now perfectly acceptable in the care and cure of the sick would never have been explored had the physician been deterred by the fear of suit upon failure. Many past bad results would never have contributed to the total experience of medicine so as to guide the physician to future good results had he been controlled by the premise that threat of suit contributes to good medicine. Fear dictates *status quo* (conservative treatment) and this may not be the vigorous, scientific approach necessary for the solution of a vexing medical problem.

The Cost Of Medical Care Is Aggravated

This economic effect of suits being filed is a companion to the strained physician-patient relationship. If the patient is viewed as a potential plaintiff, then expenses must be incurred to prevent that relationship from developing. Lawyers need only represent a defendant in a criminal case by court appointment to experience this same kind of feeling. Interviews at the jail are now expensively recorded by some attorneys to protect them from "their client." Time of trial is protracted by extending every conceivable (whether tactically wise or not) safeguard to the accused—motions for new trial argued, appeals noted, etc., etc. An important distinction here is that in the client-lawyer relationship the taxpayers foot the legal bill, while in most physician-patient relationships, it is the patient's cost that is affected. This last effect is mentioned not to argue that physicians ought never to be sued, but that suits against physicians should not be so lightly undertaken as they are. Many suits filed against a physician are instituted without first getting an opinion from another physician that there had been a departure from accepted medical practice in the treatment of the plaintiff. To this the attorney may reply that he was driven to such ends because of the conspiracy of silence which physicians practice with respect to this problem. This contention brings me to the next effect of filing suit.

Physicians' Isolationism

The buckshot, trigger-happy approach of the lawyer in filing suits against physicians and hospitals has had the effect of driving the medical community into a tighter, less communicative, and perhaps overly defensive group.

That a group of people under attack, in this instance the medical profession, should withdraw unto themselves is a usual, predictable phenomenon. There is nothing conspiratorial or mysterious about such an event. Lawyers ask why physicians do not set up some system whereby the medical and legal professions can confer about bad medical results. The physicians' shrinking response to this is "First, put down your gun. We'll be glad to talk, if you'll not sue." The lawyer replies, "conspiracy of silence" and files suit. This stand-off can be avoided only by conscientious disciplining within both professions.

The medical profession should appreciate the necessity of suit being filed in the meritorious case. The legal profession on the other hand, should advocate restraint to the aggrieved patient where no negligence is present or no proximate cause operative to the patient's injury.

Lawyers settling a suit against a physician or hospital should sacrifice the likelihood of publicity with

respect to settlement in recognition of the injury such publicity does the physician. Unfortunately, I have seen lawyers refuse to have cases quietly marked "dismissed" and insist upon an open court settlement with all the attendant damaging publicity to the physician.

In an ordinary civil damage suit, a reasonable offer in settlement will be accepted without thought of refusal. There is no desire by the attorney or plaintiff to hold an insignificant defendant up to public ridicule. A similar offer for the identical injury if made in a "malpractice suit" will draw an immediate refusal—not because it is not compensatory to the patient but because the physician, his insurer, and ultimately the patient (in cost of medical care) will pay more for "his peace." This observation coming from a defense counsel will perhaps draw the observation—"sour grapes." While I have missed many a good settlement, I say no—this is not sour grapes, but a call to the Bar for professional restraint in exchange for which, in my judgment, the medical profession will develop an awareness from actual experience that suits against them are not being frivolously undertaken or ulteriorly pursued, and thereupon demonstrate professional responsibility on a level equal to the Bar's.

This has been demonstrated in actual practice where a case was settled for a reasonable sum when the defendant physician could not get one member of his profession to testify in his defense and plaintiff had five physician witnesses. Responsible plaintiff's counsel will acknowledge that in the example alluded to, the settlement was "compensatory"—not tinged with blackmail. From my experience there is no conspiracy of silence in meritorious cases, but the medical profession is understandably withdrawn when it is exposed to case after case which has no merit or where reasonable settlements are rendered impossible because the Bar considers the physician a "target" defendant.

Historian Arnold Toynbee in recently reflecting upon his age of 80, made this observation about technology: "Man has now decisively overcome nature by his technology, but the victor has been technology, not man himself. Man has merely exchanged one master for another and his new master is more overbearing than his former—nature used to chastise man with whips, man's own technology is now chastising man with scorpions."

And so it is that in an age when the medical profession should be held in highest esteem it is viewed with low regard. Medical science has made cure so available that the physician is cursed (sued) because he seemingly scurries from one patient to another which indeed he must do in order to make the achievements of his art available. Were he to take his time for tender loving care the cure for others would not be there. To the lawyer, the physician might be heard to say "be patient."

The Cure

In the face of the foregoing whips and lashes which the medical profession suffers as a result of litigation, the physician can reasonably ask: What is the medical profession doing about it?

The Medical and Chirurgical Faculty of the State of Maryland and its component societies make available to the members a consideration of the charges made against a physician-defendant in a malpractice case by convening a panel of the physician's peers. When a physician has been sued for malpractice he may request the Medical and Chirurgical Faculty to set up such a panel to consider the validity of the charges made, and pursuant to this request counsel for the Med-Chi convenes the panel which then considers the case under the following general format:

First, the charges made against a physician (as formally set forth in the legal pleading or declaration) are read to the panel. This should be of interest to the members of the Bar, because it is in the Declaration itself where presumably the patient, through his attorney, unencumbered by other considerations, is permitted and encouraged under the fact pleading of the Rules to set forth his case in its best possible light. It is thought, therefore, that the reading of pertinent parts of the Declaration will present the case in a posture most favorable to the patient.

Second, any definitive responsive pleading of the defendant physician is read to the panel. Examples of such pleadings are those which may be pertinent to a charge that the physician failed to procure proper consent, or a plea that limitations have run from the date the alleged wrongs should have been discovered.

Third, all documentation of the medical case is made available to the panel. This usually includes a hospital record as well as written reports from other physicians who may have considered an aspect of the case. The hospital records are not read *in toto*. Pertinent sections are read to the panel and the record itself is made available to each member for his individual consideration. The written reports of physicians (particularly those forwarded to counsel in the case) are usually read *in toto*, because it is in these reports that the respective positions of the parties in the medical sense are more clearly articulated and the issues more precisely delineated. Depositions, or more often resumés are read to the panel where they may touch on the medical aspects of the case.

Fourth, the defendant physician is asked to divulge all of the information which he has pertaining

to the matter and to state, in his own way, the defense, if any, which he may have to the charges made.

Finally, upon an indication from the panel that it is satisfied that the factual questions have been answered and that an adequate factual basis for its conclusion has been established, the defendant physician is excused to await the panel's deliberation of the case.

In the defendant physician's absence, the question put to each member of the panel is: "Should this case be settled or defended?" This question is followed by a definition, where necessary, of the legal considerations present with regard to the particular case, such as the meaning of the term negligence, erroneously styled "malpractice." The principles of negligence are explained so that the panel understands that it is not essential to a plaintiff's case that he show a malicious or intentional or wanton disregard of the patient but only that there was a violation of the standards of care usually and customarily adhered to in the practice of medicine by similar practitioners in this community. The panel is admonished that the standard of care in "this community" is usually as high as anywhere in the country since we are in a very sophisticated and accomplished medical community.

The panel and its individual members usually have questions of a legal nature which counsel endeavors to answer. When each member of the panel indicates his readiness, counsel asks for a vote, individually and by open declaration, as to whether the case should be defended or settled. This procedure usually stirs conversation and a re-evaluation of issues because as each member votes he explains his reasons and the exchange of views which ensues has been known to switch the position of the panel. A conclusion that the case should be settled is obviously predicated on the finding by the panel that the physician has been guilty of negligence in the treatment of the patient. The recommendation by the panel that a case should be settled is in furtherance of the Med-Chi policy that the best interests of the particular physician and the medical profession in general are not served by public trial of the issues presented.

On the other hand, a conclusion that the case should be defended furthers the policy of the Medical and Chirurgical Faculty that the best interests of the physician and the profession generally are served by vigorously defending cases where no negligence has been demonstrated and that it is detrimental to the best interests of the profession and the individual physician to countenance even a nuisance value settlement. In such a case the medical profession, to its credit, is fearless in submitting to an open public trial issues presented by the case, and the individual panel members themselves, thereby commit themselves to appear and testify on behalf of the defendant physician in the event the case comes to trial.

The effect of this means of evaluating individual litigation can be seen in the statistics. Only one case has ostensibly gone to trial when the panel concluded that it should be settled (ostensibly because the physician had negotiated a joint tort feasor release with the patient—settled as the panel suggested). Its being litigated was caused only because the co-defendant, in this instance a hospital, did not settle its liability for which it was held to be responsible. The good faith of the program, in terms of disposition of cases, is demonstrated by the fact that not one case has been left unsettled where the panel recommended its settlement; and in cases where the panel concluded that defense should be asserted, such defense has in all cases been asserted and, to date, with satisfactory results.

The foregoing program of the Medical and Chirurgical Faculty carried out under its By-Laws, has been held by a lower court opinion and recognized generally by the Bar to be a confidential procedure. Because of their training and their interest in the adversary proceeding, plaintiff's lawyers understandably object generally to any confidential procedure and it is frequently proposed that the Faculty make available to plaintiff's attorneys such an impartial panel. The *quid pro quo* offered by the plaintiff's attorney for such a panel is usually that should the panel conclude that the case was not meritorious he would dismiss the case or not file it in the first place.

This offer by the plaintiff's bar is hollow. It does not, as it must, recognize the rights of the patient-plaintiff to have his grievance aired in a civil proceeding as preserved to him under the Constitution, counsel's offer to dismiss or not file the case notwithstanding.

In conclusion—the injuries which the physician suffers as a result of the unwarranted, unmeritorious suit is the price which, in my judgment, the medical profession and the individual physician, must unfortunately be prepared to pay to the patient for making the right to bring such charge an unfettered one. It's the price of freedom and as long as our jurisprudence is predicated on the principles of adversary proceedings, and a person has the Constitutional right of jury trial, such injuries to physicians will continue. The salvation of the medical profession from these isolated instances of injury can only be realized through the steady disciplining of the legal profession, so that aggrieved patients who suffer from a bad result will not *ipso facto* assert that the physician was negligent. The answer is not, in my judgment, in the creation of an impartial panel system, but is only in the mutual professional disciplining and respect which we can all hope lies in the future.

The Need for Medico-Legal Cooperation in Treating Malpractice Suits

JOSEPH I. PINES, ESQUIRE
Baltimore

The problems of medical malpractice are deep-rooted. Physicians have nightmares about somebody called Belli out in California and they claim that the end result is that their insurance rates are skyrocketing and they are inhibited in their attempts to practice good medicine. Physicians are of the impression that patients and lawyers do not understand that a bad result does not automatically mean that a malpractice suit is in order. Lawyers are similarly unhappy because they claim that they cannot get the cooperation and assistance from the medical profession which they need to properly represent their clients, or the physicians are overprotective in their attitudes toward erring members of their own profession who do not deserve such protection.

In attempts to resolve these problems, our two professions have indulged in a merry-go-round of words and a ferris wheel of ideas, traveling horizontally, centrifugally and vertically, but never reaching any destination much beyond the original point of departure.

For a long time, the improvement of relations and understanding between physicians and lawyers has been a goal of mine, although an elusive one.

The nature of my practice has placed me in constant contact with members of the medical profession. I wish to assure you that I have a deep and abiding

respect for physicians, although I find it necessary at times to oppose them in the legal arena, or on relatively rare occasions become involved in malpractice actions against them. I am not unmindful of the fact that a physician brought me into this world, and in all probability that a physician will usher me out of this world. Neither am I forgetful that many members of my family and almost all of my dear and close personal friends are members of the medical profession.

Physicians are most crucial, if unwilling, participants in general litigation today. More than half of the practice of the average lawyer is devoted to personal injury cases, which are to the greatest extent determined by a medical issue.

Further, in the general opinion of the legal profession, it may well be encumbent upon the physician, in discharging his duty to the patient and his obligation to assist in the administration of justice, to attend the patient until such time as the patient is restored, as nearly as possible, to his former physical and mental condition and his former position in the community. The performance of this duty may entail a court appearance by the physician on behalf of the patient, despite the physician's fear of, and prejudice against, personal injury litigation (a prejudice probably born and nurtured in the midst of extensive propaganda to which the public has been exposed in recent years). The performance of this professional duty, to appear in court, has been largely relegated to those physicians who feel capable of weathering the legal storm.

At this juncture, it is of paramount importance to understand the basic difference in the philosophy of our two professions.

We lawyers live in a daily adversary proceeding. We expect our views, our opinions, and our judgment to be challenged. To the contrary, the medical profession, when it ventures off its medical reservation into the legal field, finds it difficult to adapt to the strange rules of the adversary proceeding. In your mind's eye, you tend to look upon the introduction of a viewpoint contrary to your own as an attack upon your personal ethics, integrity, training and professional respectability. Thus, when you become embroiled in this adversary procedure you enter timidly or are reluctantly pulled into the legal arena, where you view everything and everyone with a jaundiced eye and a skeptical and cynical fear of the unknown path ahead.

In general, physicians are critical of any member of the legal profession who has the temerity to institute a suit against a physician. It should be made eminently clear to you that there is a strong obligation and duty placed on the lawyer who represents an injured patient in a lawsuit against the errant physician. The lawyer has the right and the duty to present his cause in the light most favorable to his client by every lawful and ethical means at his command.

It should likewise be made clear that because of the gravity of the charge, there is an equally strong and corresponding obligation on the part of the lawyer to thoroughly and meticulously investigate and convince himself of the merits of the case before instituting the malpractice action.

It is standard procedure in our office to thoroughly and meticulously review a medical malpractice claim. It may surprise you to know that the number of cases accepted for handling is approximately one out of 25 or 30! If we determine that a case is not acceptable for handling, we take the time to explain to the client or his referring lawyer the reasoning by which we concluded that the case is not one to be pursued. I suggest that in many instances if the physician had taken a similar amount of time to explain to his patient, the patient more than likely would not have found his way into a lawyer's office.

We are all aware that the mere threat of suit against a physician is quite disturbing. We also know that the young or inexperienced lawyer often undertakes the handling of a doubtful malpractice case with the thought in mind that it will ultimately be settled before suit or trial. This is an unfortunate situation, one that should not be tolerated by either of our professions.

Unfortunately, we in the legal profession only have law schools and not lawyer schools. You only become a lawyer with experience, and many malpractice cases gravitate into inexperienced hands. No lawyer worth his salt should undertake a case knowing it to be tenuous. A malpractice claim is comparable to being pregnant—you either are or you aren't. I urge you and your legal representatives not to pay one cent for tribute nor one sou for nuisance value in the groundless malpractice case.

In many instances, the amount sued for is more than the amount of malpractice insurance coverage that the doctor has, causing him additional concern. Further, physicians maintain that because of the notoriety, it is humiliating to be sued in a medical malpractice case. That undoubtedly is true to an extent, but with increased specialization and the advent of, and emphasis upon community medicine, the physician-patient relationship grows less personal each year. With these developments, the stigma of the malpractice suit is also becoming less personal. In any event, the medical profession must not expect to be insulated from a lawsuit simply because of hurt feelings or because it is offensive to be sued.

We have geared our thinking to accept the fact that when we build a bay bridge, men will be killed or maimed during its construction. This does not deter us from building the bridge. Furthermore, Detroit knows that 50,000 people will be killed on the highways and many more injured each year. However, that doesn't stop production. We proceed because, in our collective opinion, the social utility outweighs the

harmful results. In the same vein, you should be geared to readily accept the practice of medicine with the frank knowledge that there may be an unexpected result for which you may have to shoulder legal responsibility.

I have attended meetings in this hall when attorneys representing liability insurance carriers have cited the statistics of malpractice cases in the Maryland Court of Appeals. Few, if any cases, have actually been decided in favor of a patient and against a physician. If you examine these cases carefully, you'll find that the medical profession has achieved hollow victories. In these reported cases, no one has declared that malpractice did not occur. The court merely reasons that the patient cannot meet the standards of proof—archaic standards that have been tailored for the medical profession.

Legal historians of tort law agree that the first half of the 20th century belongs to the defense. The second half belongs to the victims of the wrongs. Today, the walls of immunity are crumbling all around you. The medical profession's exposure to liability is expanding in many areas.

Since the courts can no longer count on the medical profession to help solve intra-professional or internal problems, the emerging trend in law finds the courts solving these problems independently.

The often-used phrase "conspiracy of silence" is slowly but surely being battered into submission. Physicians, unlike most other groups, have previously been allowed to set their own legal standards of conduct, merely by adopting their own practices. However, this has been altered in legal decisions of recent years. The medical profession is in a unique position —a physican can enter the halls of justice and tell us what is proper or improper, what is right or wrong in his profession. However, many have refused to do so. Many have abdicated their responsibility and entered into the "conspiracy of silence." The conspiracy of silence is not a mirage, but a fact of life well documented in legal opinions, texts, and studies. In the face of the abdication of such responsibility, courts are saying that 12 citizens (a jury) can determine the standards of the medical profession. Standards are being imposed on you—for you!—merely because you failed to respond to the invitation to face up to your responsibility. Juries see right through this abdication, and they react. Where convinced, they assess substantial damages against the defendant physician.

Often in malpractice trials, one of the best witnesses for the plaintiff, brought into the case by the defense, is the physician who feels that he has to protect the errant physician at all costs, no matter how ridiculous and untenable his position might be. This gives the jury an issue—a reason to become incensed.

Courts realize that the victims of medical negligence are in a predicament due to the ostrich-like behavior of members of the medical profession. They are aware that the so-called ethical practitioner will not testify on behalf of a plaintiff, regardless of the merit of his case. This is mainly due to the pressure exerted by either medical societies, or public liability insurance companies that issue policies and liability insurance to physicians covering malpractice claims. Courts know that physicians flock to defend their fellow members charged with malpractice, and the patient must depend on expert testimony from the heroic soul who, for the sake of truth and justice, has the courage to run the risk of ostracism by his fellow practitioners and the cancellation of his public liability insurance policy.

Judicial notice is being taken of the medical profession's continued reluctance to enter the legal arena and set its own standards. Therefore, the courts are devising measures to equalize the conflict (the even-handed policy).

Witness the development of the *Doctrine of Common Knowledge* in Professional Liability suits. This Doctrine is similar to, but distinct from, the Doctrine of Res Ipsa Loquitur. Under the Doctrine of Common Knowledge, the act or omission causing the injury must be proved but no expert testimony is required to establish the precise standard of medical care. The assumption is that a jury can determine the standard of care to be applied from its fund of common knowledge.

In an opinion handed down recently by the Fourth Circuit (of which Maryland is a part), an action was brought against a physician to recover damages for medical malpractice. The patient underwent an operation to correct a left ectopic tubal pregnancy. Inadvertently, the right ureter was sutured in two places, eventually requiring the removal of a kidney. It was conceded that there was no negligence involved. Because of the inherent risk of damage to the ureters in a case such as this, the physician contended that the suturing of the ureter was not the result of negligence on his part. If the plaintiff could recover damages, it must be on the grounds that the physicians were negligent in delaying their use of standard diagnostic procedures and that the delay necessitated the removal of the kidney. The court in this case ruled: "When it is known from expert testimony that a blocked ureter required immediate repair and that a standard diagnostic procedure (IVP) is indicated, *it does not* take a doctor *to decide how much delay is a failure to exercise due care.*"

The courts are supplying the missing link. Laymen are setting the standards for you—the medical profession.

Professional negligence against a physician may also be proven by his own statements both in and out of court. A recent Maryland case involved three means of proving malpractice where experts were not available:

1. It was held proper to call the defendant doctor as an adverse witness and elicit from him an opinion regarding the standard of practice.

2. Hospital records endorsed by the physician were entered into evidence as an adoptive admission.

3. Conversations between the physician and the patient were held admissible as a basis for negligence or malpractice.

Currently the citadel of the *Locality Rule* is being besieged. Under the strict and narrow version of this rule, the competence of an expert medical witness to testify about the standard of care is determined by his familiarity with care ordinarily exercised in the same locality in which the defendant practiced. If the courts had continued to strictly apply the Locality Rule, malpractitioners would erect a fortress of immunity as a ready refuge for medical negligence. Forces are at work leading to a liberalization of the rigorous Locality Rule. The liberalization of the Locality Rule has been generated by transformation in American life, medicine, and judicial attitudes. Improved means of transportation and communication, the availability of continuing medical education, and the increased excellence of medical schools has led to a judicial re-evaluation of the Locality Rule. All of this has combined to create one community of medical practitioners out of the 50 states and the District of Columbia. Thus, a doctor from any part of the country may soon be competent to testify anywhere in a malpractice suit involving a "settled" practice.

Another avenue of liability being opened to plaintiffs rests on the *Doctrine of Informed Consent*. There is sturdy support for this doctrine which imposes upon physicians the responsibility to warn their patients of risks of probable adverse results in proposed diagnosis or treatment. It is being strongly urged that a physician's duty to warn a patient should not be measured by the general practice followed by the members of the local medical profession. The determination as to whether this basic duty has been violated is being wrested from the indulgent and not altogether disinterested keeping of the defendant-physician's colleagues and is being placed on the jury.

So, we are beginning to see vexing medico-legal questions being approached and resolved by the seasoned reason of the common law. In the past decade, there has been a veritable cloudburst of cases throughout the country which inspire trust in the competence of the civil jury to bring to medico-legal questions a tested common sense, a common sense which is neither manacled in dogma, frozen in a formula, or subservient to a particular partisan medical view.

In time, the medical profession will mature to a point where it will not view malpractice cases quite so personally, as it does today. It will come to realize that each physician is a human being, and, being human, is capable of error and, that if error is committed to injure an innocent party, then that injured party should receive monetary damages. The image of a malpractice case by a lawyer or a disgruntled patient as a "figment of the imagination" must be erased by the medical profession.

Hopefully, you will come to the realization that there is not always a community of interest between the medical profession and the liability insurance companies and their representatives. Hopefully, you will separate fact from fiction in the mounds of malpractice propaganda that has been targeted toward you, and you will resist the external economic, social, and professional pressures.

The truth always originates in a minority of one, so the prescription to solve the malpractice problem lies within each individual's capability of breaking the existing precedents. Up to now, the collective keeper of the physician's conscience has not been the medical profession, or the individual physician, but the liability insurance industry. I submit that over the years, they have charted a course for you which has proven to be self-defeating. Very simply, I suggest that you reclaim your collective conscience. This may smack of heresy, but the heresy of today is the commonplace of tomorrow. Let's work toward one goal—the fair and honest administration of justice.

your medical faculty at work

by John Sargeant
Executive Secretary

The Council met on November 20, 1969, and took the following actions:

1. Endorsed the proposed Bylaw amendments to be submitted to the Special House of Delegates session on Saturday, December 13, 1969, at 2:00 PM;
2. Agreed to recommend Emeritus Membership to the House of Delegates for certain members, all at the request of the component society involved;
3. Adopted Council meeting dates for 1970;
4. Changed the Faculty's personnel policies to provide that professional librarians will receive four weeks vacation each year; with the understanding that it will be pro-rated during the first year of employment and will not change with increases in tenure of employment;
5. Heard a report from Raymond T. Holden, MD, of Washington, D.C., a member of the AMA Board of Trustees, who discussed various activities of the AMA;
6. Authorized appointment of the firm of Anderson, Coe and King as legal counsel for 1970;
7. Adopted a Revised Laboratory Services Policies, as recommended by the Executive Committee. (See next page for the revised policy);
8. Authorized the President to name an Ad Hoc Committee on New Faculty Building. This group is to investigate, in detail, all the various facets of such a move, such as space requirements, building requirements, costs, etc, and to make a report to the Council or House of Delegates;
9. Adopted the Financial Operating Statement and Dedicated Fund Statement through September 30, 1969;
10. Authorized the President to make recommendations for appointments to the various steering committees of the Advisory Council on Comprehensive Health Planning for the Baltimore Metropolitan Regional Planning Council;
11. Agreed to notify component medical societies and the various state-wide Specialty groups of proposed changes in the Tax Reform Laws of 1969 currently under discussion in the U.S. Senate Finance Committee;
12. Voted to disapprove a recommendation of the Professional Medical Services Committee that would have permitted this committee to collect valid data concerning charges for physicians' services.

Revised Policy of the Medical and Chirurgical Faculty of the State of Maryland in Connection with Laboratory Services and Billing

In June, 1965, the Council adopted certain ethical standards for physicians to follow in connection with laboratory services for their patients. Since that time, the State has adopted a licensure law for the operation of laboratories and, in addition, has established regulations (which have the force of law) within which laboratories must operate.

It is obvious, therefore, that Faculty policy should be re-examined in the light of the current situation and the policy in effect be revised if it is considered desirable to do so.

The Executive Committee, therefore, recommends that the following be adopted as Faculty policy in connection with the use by physicians of laboratories in Maryland, as well as in the use of laboratories which operate on a "mail-order" basis and to which physicians mail specimens.

Revised Policy

Medical considerations, not cost, must be paramount when the physician chooses a laboratory. The physician who disregards quality as the primary criterion or who chooses a laboratory because it provides him with low cost laboratory service on which he charges the patient a profit is derelict in not acting in the best interests of his patients. However, if reliable quality laboratory services are available at lower cost, the *patient* should have the benefit of such savings.

It is imperative that the physician be assured that his patients are receiving the highest quality of laboratory services. A physician should not utilize the services of any laboratory, irrespective of whether it is operated by a physician or non-physician, unless he has the utmost confidence in the quality of its services. One manner in which this confidence could be put to a test is whether he would use these same services for himself or any member of his family.

It is preferable that the laboratory, not the attending physician, bill and collect from the patient or third party payor for laboratory services. Where circumstances make this impractical or where increased costs to the patient would result, the bill submitted by the attending physician to his patient or third party payor should provide information to show where such services were performed, as well as an adequate description of the services provided and the specific charges made by the laboratory for the tests, as well as his procurement and processing charge.

The Attending Physician is entitled to fair compensation for the professional services he renders. He is not engaged in a commercial enterprise, however, and any markup, commission or profit on the services rendered by a laboratory is exploitation of the patient.

A contractual agreement between a laboratory and a physician is generally not in the best interests of the patient and could be construed as "exploitation of the patient." If a physician enters into such a contractual arrangement, it is impossible for him to ascertain his cost per test performed and so bill in accordance with the preceding statement. If such a contract is entered into by the physician, the only manner in which "exploitation of the patient" *could not be construed* is if the physician absorbs this monthly contract charge into his regular office overhead. In such a case, no individual billing for individual laboratory test performance would take place. A true cost cannot be determined for specific tests under such a contract that allows a sliding scale of fees depending on the volume of tests performed.

Regulations issued by the Maryland State Department of Health require that all laboratories offering services in Maryland be registered with that department, before the provision of such services. Physicians who utilize the services of non-registered laboratories may find themselves in violation of Maryland law.

It shall be considered unethical for a physician to:

(a) Submit specimens to any laboratories not professionally and adequately supervised in accordance with State laws and regulations.

(b) Bill in a manner not in accordance with previous statements of policy enumerated in this document.

(c) Send specimens to any laboratory rendering such services at a flat fee, unless the cost of such services is included as a cost of his normal office overhead.

(d) Share income from laboratory services either directly or indirectly with any lay person.

(e) Offer laboratory services under a fictitious name.

(f) Have a financial interest in any clinical laboratory where the physician is not personally and professionally responsible for the quality of the work performed in the laboratory.

(g) Collect fees from any third party payor or the patient for laboratory services not performed by him or his regularly employed assistants, without full disclosure as enumerated in the fourth paragraph of this revised policy.

Recognizing the need for the physician who operates a laboratory to acquaint physician-members of the community of the services available for patients, it is considered ethical for a physician to:

Send to any other physician of his choosing an announcement that he has opened an office, changed the location of an office or changed the professional composition of his office for the practice of medicine, in the format approved by the Medical and Chirurgical Faculty. Return forms that serve only to facilitate the communication between the interested physician and laboratory but do not in themselves give specific information, such as fees, office hours, special qualifications, other than membership in professional Boards or Societies, are acceptable. Fee schedules and other specific information material may be sent only to those physicians who request them or who regularly utilize the facilities of the laboratory.

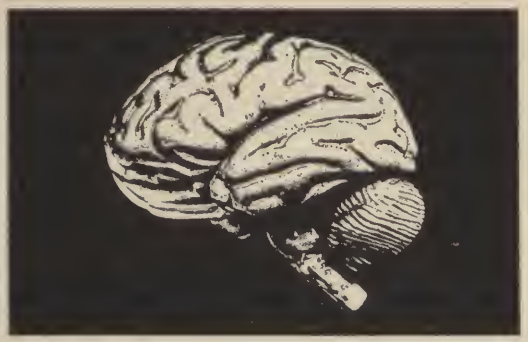
It is considered unethical for:

(a) A lay employee, directly or indirectly, to solicit work from physicians.

(b) To advertise laboratory services in any media such as magazines, journals, newspapers, etc.

(c) To display any advertising material on vehicles.

(d) To distribute mailing containers except on request.



It is recognized that laboratories operated by non-physicians are not bound by these ethical guidelines. However, the practice of Pathology being considered an integral part of the practice of medicine, Pathologists cannot be considered differently than other physicians such as the general surgeon who is not permitted to send out brochures extolling his willingness and ability to perform surgical services for the physician's patient.

In adopting the above policy, the Medical and Chirurgical Faculty's Council urges that every effort be made to have included in the Laboratory Regulations issued by the State Health Department the same ethical guidelines to which physicians must adhere.

Suggested regulations could read as follows:

NO PERSON, PARTNERSHIP, ASSOCIATION OR CORPORATION SHALL WITHIN THIS STATE, EITHER DIRECTLY OR INDIRECTLY, ADVERTISE OR SOLICIT BUSINESS FOR ANY LABORATORY WHETHER SUCH LABORATORY IS SITUATED IN THIS STATE OR ANY OTHER STATE, OR PROVIDE REBATES OR OTHER FEE SPLITTING ARRANGEMENTS WITH RESPECT TO LABORATORY SERVICES. HOWEVER, A SIMPLE ANNOUNCEMENT OF AVAILABLE SERVICES MAY BE PROVIDED TO LICENSED PRACTITIONERS OF THE HEALING ARTS. THE CONTRACTUAL PROVISION OF LABORATORY SERVICES FOR A FIXED FEE INDEPENDENT OF THE NUMBER OF SPECIMENS SUBMITTED FOR SUCH SERVICES IS DECLARED TO BE A VIOLATION OF THIS SECTION.

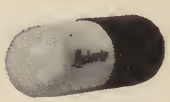
Voluntary Admissions

The number of patients who were self-admitted to Maryland's psychiatric hospitals increased from 1,748 in 1962 to a record 4,412 (or 36.8% of all admissions) during the 1968 fiscal year. The following table shows that much of this rise reflects the rapid growth in admissions for the treatment of alcoholism. As indicated, the number of these patients has more than tripled in the last six years and now accounts for 49.7% of all admissions, as compared with 28.7% in 1962. Alcoholics have a higher than average percentage of voluntary admissions. The increasing proportion of total admissions with this diagnosis has therefore produced a concomitant rise in the number and percentage of total voluntary admissions. Within most of the diagnostic categories shown, the proportion of self-admissions changed only slightly between 1962 and 1968.

Reported Primary Diagnosis	Number of Admissions		Percent Voluntary in Each Diagnostic Group	
	1968	1962	1968	1962
TOTAL ADMISSIONS	11,997	6,221	36.8	28.1
ALCOHOLISM	5,957	1,785	46.6	44.4
PSYCHONEUROTIC REACTIONS	757	424	50.6	52.8
OTHER PERSONALITY DISORDERS	737	410	29.3	34.4
SCHIZOPHRENIA	1,725	1,738	29.1	19.2
OTHER PSYCHOTIC DISORDERS	359	354	38.2	33.6
DISORDERS RELATED TO OLD AGE	647	730	7.3	5.9
MENTAL RETARDATION	129	157	20.9	10.2
ALL OTHERS	1,686	623	19.2	13.2

A number of other factors also related to the relative frequency of voluntary admissions. These included:

1. PREVIOUS HOSPITALIZATION STATUS—33.0% of admissions with no reported prior psychiatric hospitalization and 39.5% of readmissions were voluntary. Excluding alcoholics, these percentages were reduced to 24.0 and 30.3, respectively.
2. RACE AND SEX—The percentage of voluntary admissions varied from 40.6 for white males to 36.4 for white females, 30.8 for nonwhite males and 28.9 for nonwhite females. This sex difference was mainly related to a seven to one male-female ratio in admissions for alcoholism. The racial variations, however, reflected a continuing greater use of the voluntary admission procedure by white residents.
3. AGE—Voluntary admissions were relatively most frequent in the age group 25 to 44 (41.5%) followed by those between 45 and 64 years of age (38.5%). In the youngest age group, under 25, 30.8% of admissions were voluntary. Among those 65 years of age or older, where most admissions are for problems related to old age, only 7.0% were voluntary.



Many individuals requiring psychiatric hospitalization have sufficient recognition of their illness to accept treatment services voluntarily. Since this initiative is considered to be a potentially positive factor in the treatment outcome, major efforts to encourage use of this procedure are warranted.

Contraindications: Hypersensitivity to tetracycline.
Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.
Precautions: Nonsusceptible organisms may overgrow; treat superinfection appropriately. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).
Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity reactions*—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage. Upon adverse reaction, stop medication and treat appropriately.

Drunk Employees Rise but Labor-Short Firms Often Don't Fire Them
Concerns Try Rehabilitation, Score Startling Success; A $4 Billion-a-Year Problem
Costly Caper of Drunk Santa

COLUMBUS, Ohio—Something was wrong. The crane operator was operating his crane erratically, so his supervisor at Buckeye Steel Castings Co. signaled him down. "What's the trouble?" the supervisor wanted to know. And, he asked, why couldn't the crane operator walk a straight line—and why did he smell of alcohol so early in the morning?

"I had a beer before I came to work," the operator answered bellicosely.

Indeed he had. And he hadn't stopped with just one, an on-the-spot check with a breath analyzer disclosed. In fact, the test indicated the man was roaring drunk. And so the crane was idled and the people at Buckeye Steel Castings chalked up a few more hours lost to drink.

But the crane operator wasn't fired, as he almost surely would have been a few years back. Rather, under threat of firing he enrolled in the company's problem-drinker program. Thus, company officials hope to help the man salvage his life—and, somewhat less altruistically, to help themselves salvage a worker in these times of severe labor shortage.

Reprint Permission Granted by *The Wall Street Journal*, October, 1969.

The Corporate Conscience

A drunken worker, of course, is not a new problem. But it is an increasing one, and it is especially troubling employers now because many of them have developed corporate consciences and hate to fire a worker for what they now view as a disease—because if they did fire a worker it would be very difficult to find a replacement now that the unemployment rate is so low. One result is that there now are formal drinker-rehabilitation programs at an estimated 1,000 companies, ten times the number a decade ago.

The dimensions of on-the-job alcoholism are elusive because most drunks are able to conceal their problem. "It's an iceberg, with the biggest part hidden from management," says an official of Anchor Hocking Corp. of Lancaster, Ohio. Buckeye Steel, a Buckeye International Inc. subsidiary that discusses the problem more candidly than most companies, estimates that 18% of its employees have a drinking problem that affects the company. That rate is probably higher than average, because

Buckeye studies have found that the rate tends to run high in the foundry industry, where the labor pinch is particularly acute.

There's no question the problem is worsening. Officials at the National Council on Alcoholism estimate that alcoholism costs American employers $4 billion a year in lost time and ineffectiveness. That's up from an estimate of $1 billion five years ago, although officials now say that the 1964 estimate was too low.

"Alcoholism is more prevalent in industry than it was five years ago," agrees J. J. Davis, president of Esco Corp., a Portland, Ore. alloy steel foundry. "It may be the result of greater affluence in that people have more money to buy booze. And they know employers can't fire them so readily in a tight labor market."

A Jolly Santa's Caper

Whatever the reason a worker shows up drunk, it can foul up operations. Efficiency experts reckon that North American Rockwell Corp. lost 500 man-hours of production as employees gathered to gawk and talk one December day after a drunken worker donned a Santa Claus costume and romped for an hour through an aircraft plant.

Excessive drinking is the biggest single factor in absenteeism, itself industry's biggest personnel headache, according to L. R. Price, executive vice president of the American Society for Personnel Administration. Records at North American Rockwell's division here in Columbus indicate that employees with drinking problems average an extra 30 days of absence annually, most of which must be made up by other employees on overtime. Counting only the 310 hourly workers that have entered the company's problem drinking program, this figures out to added costs of $125,000 a year unless their drinking can be controlled.

What's more, when a drunken worker does show up he's often aware he isn't functioning properly and thus slows down to avoid accidents or mistakes. A heavy drinker may reduce his output by 50% or more, authorities say. Mistakes made by on-the-job drunks add thousands of dollars more to companies' costs.

Keeping an Eye Peeled

One result of all this costly boozing by all these scarce workers is that companies are making a bigger effort to spot the alcoholics early when there's considerably more opportunity for rehabilitation. "I tell supervisors to be alert for any change in behavior, such as the jovial employee who becomes morose or the gregarious guy who turns into a loner," says Dr. Luther A. Cloud, senior associate medical director for Equitable Life Assurance Society of the U.S. and president of the National Council on Alcoholism.

Other signs Dr. Cloud looks for: "Any irresponsible behavior or general loss of efficiency, chronic lateness, prolonged lunch hours and leaving early on Friday." He says that "the typical pattern of Monday absences and physical symptoms like tremors and sallow complexion come later—when we see a man at that stage, it's late."

Surprisingly, even though companies are on the watch for alcoholics, the average employed alcoholic isn't discovered until he has had a drinking problem for ten years, one study said.

Once discovered, the drunk is usually turned over to a company doctor and an "employee alcoholism counselor," which is a new speciality at many major companies. The hardest problem for these doctors and counselors is getting the employee to admit he's an alcoholic. "Sure I drink, but I can control it," the man often says. Or, "I don't have a drinking problem. My problem is paying the rent."

After that barrier is broken, most companies with formal rehabilitation programs follow a common pattern of treatment. They generally insist on a thorough physical examination, with hospitalization in alcoholic wards if the case is severe. Almost invariably, the employee is urged to join Alcoholics Anonymous for group therapy, with other AA members at the company taking him to the first few meetings. North American Rockwell sponsors AA meetings on company premises, and other companies, such as Equitable, give time off to attend meetings outside the office.

Corporate specialists also enlist the assistance of community resources, including church groups, public clinics, welfare agencies and social workers. The companies sometimes arrange loans to help solve financial crises, which all alcoholics seem to have. "I've never known an alcoholic who wasn't in debt," says one doctor who works with alcoholics, "and that includes two company presidents with incomes of over $100,000 a year."

"When a man has lost his house and his family, is living in his car in the parking lot and has had his paycheck garnisheed, he needs more than a lecture," says one employee alcoholism counselor.

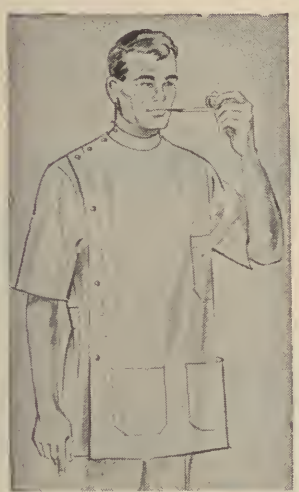
Some companies also insist that a worker take medicine, frequently a drug called Antabuse that remains dormant in the body until the person drinks alcohol. Then he gets violently ill. "My ears burned, the veins on my hands stood out and my heart jumped out like this," recalls one reformed alcoholic, holding his hands six inches in front of his chest. "Then my legs got rubbery and I went down."

But making sure workers take the drug is difficult. Some companies insist the workers take the pill each day in the presence of a supervisor or company nurse. Even that isn't foolproof. Frank Marsh,

chairman of the United Auto Workers alcoholic committee at a Fisher Body plant here, says that some workers try to pass off other, similar pills as Antabuse.

But once a worker is on the way to kicking his habit, he is usually grateful for the help he has been given. Don Harris is the alcoholism counselor at Buckeye Steel Castings here, and he has a Spartan office by the plant gate where workers periodically stop in to see him. (Workers wouldn't come to a fancy office with a receptionist, he says.) He sees lots to encourage him.

On one recent day, a gold-shirted man in his 40s came in with a big smile and a firm handshake. He had just come out of 14 days in a hospital's alcoholic ward, the longest period in recent years that he had gone without a drink. He felt great, he said, and he was confident that, with the help of Alcoholics Anonymous, he could whip his problem. A father dropped by to say he had been sober for 30 days.



Indeed, big companies say they have a startling success rate of 55% to 70% in returning problem drinkers to sobriety. This is far higher than the recovery ratios at hospitals and treatment centers for alcoholics, but doctors say there is a reason.

Explains Dr. Gordon M. Hemmett of Eastman Kodak Co.: "Alcoholics need some sort of crisis to break through the wall of denial that they have a drinking problem. Threat of job loss is a very potent means of creating a crisis for the purpose of getting the alcoholic's attention." And once the worker recognizes his problem, doctors say, a company has effective leverage in that he either must cooperate in rehabilitation or be fired.

The First Breath

Life hangs on the infant's first breath, yet all factors that operate to bring off the event safely are not clearly understood. One essential is that lung surfactant be present and at birth form a surface film in the alveoli to stabilize the peripheral air spaces.

One of the marvels of the birth of a child is the remarkable adaptation from intrauterine to extrauterine life. That the infant, when delivered, will give a lusty cry has come to be taken for granted. Failure of the event, or its delay, is tragic. Undoubtedly, adverse events at the time of delivery are the cause of significant neuromuscular and cerebral deficits in later life.

Thus, one approaches the problem of the initiation of breathing not only with the curiosity of the scientist and the attitude of pursuit of understanding for its own sake, but also with the realization that, with further understanding, morbidity and mortality associated with birth may be reduced.

Since the fundamental physiologic mechanisms of the initiation of breathing are essentially the same for all animals, there is abundant opportunity to study this phenomenon and to apply knowledge gained from animal studies to humans.

In a study with goats, it was found that the fetal lung weighed nearly twice as much as the postnatal aerated lung. The difference was due to the presence of liquid. Histologic examination showed that the liquid was mostly in the airways. This means that the fetal lung near term is distended with a volume of liquid about equal to that of the functional residual capacity after replacement of the liquid by air.

Air-Liquid Interface

With the introduction of air into the lung, there is an associated increase in pulmonary blood flow. Because the osmotic pressure of the blood exceeds that of the lung liquid, the osmotic forces favor the movement of liquid into the blood. The creation of an air-liquid interface produces local pressure differences within the lung that allow for drainage of the liquid from the terminal air spaces.

Delay in the process of clearing the lung of liquid sometimes leads to a clinical syndrome which may be called transient tachypnea of the newborn. The outstanding feature is a significantly elevated respiratory rate; rales are usually absent, which is consistent with liquid in the interstitial spaces. Heart sounds are normal, as are blood gases. The tachypnea may last for 24 to 72 hours.

As for the stimuli that must be operative in the initiation of breathing, various studies have shown that tactile, thermal, and sensory stimuli can increase the output of the respiratory neurons. Chemical stimuli, which are always in the direction of decreasing Po_2 and pH and increasing Pco_2 during the birth process, are able to stimulate the first breath and doubtless are critical to the maintenance of respiration. However, with a prolonged second stage of labor, the blood gases can quickly reach necrotizing levels. Thus, use of CO_2 as a respiratory stimulant or allowing for further hypoxia is not going to be constructive in assisting the first breath, and could be lethal.

Change in Temperature

In recent years there has been a great deal of interest in whether change in temperature is important in initiating breathing. In most parts of the world, the infant is exposed to a sudden change in temperature from 99°F of intrauterine life to about 70°F room temperature. Whether this is important or is only an associated event is not clear. Other possible influences on initiating the first breath have also been studied, but at present, priority cannot be assigned to any one.

The first breath also raises the question of the

Mary Ellen Avery, MD. The Amberson Lecture. *American Review of Respiratory Disease.* September, 1969, Vol. 100, No. 3.

first expiration. Obviously, if all the air that entered the lung were to leave it on expiration, every breath would resemble the first breath. It is necessary for the normal pulmonary adaptation at birth to create a functional residual capacity. This can be achieved only if the pulmonary surfactant is present and a surface film is formed at the moment of birth, allowing for the stabilization of the peripheral air spaces.

Studies at the time of appearance of the surfactant in fetal animals show that toward the end of gestation surfactant is always present, although at different times in different animals.

Chemical analyses of lipids have shown that the concentration of surfactant is higher in the newborn than in the adult. Since surfactant is so critically important to the retention of air in the lung at end expiration, perhaps there is an abundant supply available in the newborn to permit air retention in association with the first breath. Or, it could be that the mechanisms for the removal of surfactant are not operative in the fluid-filled lung and an accumulation occurs. In any event, it seems that the newborn is particularly blessed with an abundance of this essential surface tension-lowering substance.

When surfactant is deficient or further synthesis is impaired, the consequences are a tendency to airlessness with each expiration and, of necessity, the application of high applied pressures to maintain respiration. This leads to marked retractions commonly associated with atelectasis and hyaline membranes, a disorder characterized at death by a deficiency of the pulmonary surfactant. The half life of lipid components of surfactant have been estimated at approximately 14 hours. This raises the question of whether some infants who have minimal respiratory difficulty in the first hours of life may suffer from an impairment of further synthesis of this essential compound. Their worsening pulmonary status during the second and third day of life may then represent its utilization and failure of formation.

Learning from the Infant

Many of the details of how the infant can be assisted in taking his first breath are lacking, but it must be remembered that each breath after birth differs in some respects from the one before. As the lung liquid clears, the mechanical properties of the lungs change, blood gas tensions change and, therefore, any respirator must adapt to the events taking place in the infant or be operated by someone skilled in artificial respiration who can assist the infant.

Advances in physiology with respect to understanding respiratory control mechanisms and other events associated with respiration at all ages will, it is hoped, enlarge our understanding of the first breath. Possibly, too, further attention to this most significant event would throw light on respiratory problems at all ages.

ROBERT E. FARBER, MD, MPH, COMMISSIONER

Baltimore City health department

Highlights

Rubella Campaign Begins

A total of 10,789 children in Baltimore public schools received the new rubella vaccine in the first phase of the local Rubella Immunization Program. Those children immunized attend 35 randomly selected schools and are enrolled in Early Admissions, kindergarten, first, second, and third grades.

Conducted on November 3, 4 and 5, 1969, the immunization program will be continued as additional funds and vaccine become available. While the first priority target in the city rubella campaign is 16,000 children in the five- to eight-year-old age group, a total of 3,739 parochial school children of similar age received German measles vaccine in a preliminary vaccine study conducted by the Division of Infectious Diseases of the University of Maryland School of Medicine in early 1969.

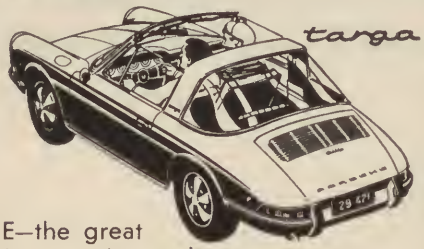
The Maryland Rubella Immunization Program is jointly sponsored by the Medical and Chirurgical Faculty of Maryland and local medical societies and health departments, local departments of education, and local voluntary health organizations. Chairman of the Baltimore City School Immunization Program is John B. Saratsiotis, MD, Director of the Bureau of School Hygiene in the Baltimore City Health Department. Other members are Robert E. Farber, MD, Commissioner of Health; John B. De Hoff, MD, Deputy Commissioner; James D. Carr, MD, Assistant Commissioner for Local Health Services; Miss Alice M. Sundberg, Director, Bureau of Public Health Nursing; Allan S. Moodie, MD, Director, Bureau of Communicable Diseases; Mr. Joseph Gordon, Director, Bureau of Health Information; and Mr. John H. Westerholm, Public Health Advisor of the U.S. Public Health Service assigned to the Baltimore City Immunization Program.

Air Pollution Control

A major advance in the Baltimore City Health Department's efforts to provide cleaner air for Baltimore took place recently when the Armco Steel Corporation dedicated a new dust control system. This is a million dollar project which had its beginnings in 1965 following discussions between Armco management and the Department's Bureau of Industrial Hygiene.

The new Armco air pollution control installation will improve the city's environment by filtering 230,000 cubic feet of air per minute containing iron oxide particles which previously had been emitted into the atmosphere.

Other noteworthy air pollution control activities under surveillance by the City Health Department in recent months include: the recent installation of a gas jet-engine electric generator at the Westport station of the Baltimore Gas and Electric Company to eliminate the emissions from three stacks connected to low pressure coal burning units, a source of air pollution in the area for many years; the installation of a baghouse collector device for smoke and particulate matter on a cupola of the American Brake Shoe Company; and the installation of dust collection equipment at the Peavey Grain Company to eliminate grain dust in the Locust Point area.



The above are a few of the more recent industrial improvements directed at curbing the city's air pollution. Overall, the City Health Department maintains constant surveillance of the atmosphere with four air monitoring stations located at strategic points in the city. It is also noteworthy that in 1968 some 504 building plans were examined for compliance with air pollution control requirements.

MRS. FRANK A. FARAINO, EDITOR

woman's auxiliary

Auxiliary Members Attend Workshops

Six members of the Executive Board of the State Auxiliary attended the Eastern Regional Workshops on October 23-24, 1969, at the Sheraton Park Hotel in Washington, D. C. They were: Mrs. Wallace H. Sadowsky, president, who attended the sessions on Health Careers in the absence of Mrs. Robert J. Dawson, State Health Careers chairman; Mrs. Raymond M. Yow, president-elect; Mrs. Elmer G. Linhardt, state chairman for AMA Education and Research Foundation; Mrs. Harold P. Biehl, state chairman for Children and Youth; Mrs. S. G. Sullivan, treasurer, who attended sessions on Membership; and Mrs. DeWitt DeLawter, state chairman for Legislation.

Mrs. John Chenault, president of the Woman's Auxiliary to the American Medical Association, welcomed the representatives from the 13 states and the District of Columbia and expressed hope that the workshop meetings would help provide answers to problems that state chairmen might have, as well as stimulate enthusiasm. Raymond T. Holden, MD, a member of the AMA Board of Trustees, addressed the group and extended wishes for successful endeavors.

Mrs. G. Prentiss Lee, 1st vice president of the national auxiliary and Membership chairman, set forth the purpose and procedure of the meeting and introduced Mrs. Herbert J. Ulrich, regional vice president, who then introduced the national chairmen of the six committees involved in the workshop.

Mrs. Howard G. Ellis, national auxiliary chairman for the AMA Education and Research Foundation, stated that in the past 15 years $68,000,000 has been donated to the Foundation by physicians and their wives, and $43,000,000 had been contributed to the student loan program, enabling 39,000 students to complete their medical education. The auxiliary actively participates in raising funds for financial assistance to medical schools and the Loan Guaranty Fund. The auxiliary gave unrestricted funds to 113 medical schools in January and February 1969 and also to the Biomedical Research Institute, which was the only agency for primary research in the country supported completely by unrestricted funds. The Guaranty Loan Program was reactivated as an auxiliary project in 1969 because of the impact of increased tuition and related living costs, tight money, and a cutback in federal loans. Loan applications, pouring into AMA at an unprecedented rate, have depleted the reserve which had been built up from repayment of loans. In the month of September, 800 loans were made to medical students, and it is estimated that for the academic years 1969-1975, there will be a need for 203,000 new loans amounting to $26,310,000 to enable students to complete their medical education. The auxiliary contributed $428,875.77 in 1968-1969 and it is hoped that this proud record will be surpassed in 1969-1970.

Mrs. Paul E. Rauschenbach, national auxiliary chairman for Children and Youth, said that her committee is concentrating on building a strong family unit. Since 50% of a child's ability to learn occurs during the first four years of his life when his mother and father are the only influencing factors, the atmosphere of his home during this period is most important.

Mrs. Wendell Roller, national auxiliary Health Careers chairman, stated that health power is people power, and that people are needed to help create

strong health power. Three factors are involved: recruitment for health careers, training of skilled personnel to perform health services, and funding (loans and scholarships) to enable young people to enter the health field. Inactive and retired health workers must be encouraged to return to service. Refresher courses and the establishment of child day-care centers play an important role.

Mrs. William R. Flood, national auxiliary Legislation chairman, said that every auxiliary member must be informed, inform others, and become involved with all health-oriented legislation, plus community, state and national issues important to every citizen. She announced a new concept that has been added to the national legislative program, to be implemented on the local level. The auxiliary has been asked by the AMA to include involvement in public affairs in its legislative program. A kit has been prepared suggesting ways to encourage more participation in public affairs projects within the community.

Mrs. Lee pointed out that membership is a priority project for each state auxiliary. More than recruiting new members, it includes involving and thus retaining members in the organization. The program and scope of each auxiliary should be broad enough to meet the interests and needs of all members, should provide opportunities for leadership development, should offer members a means for participation in meaningful activities in their husband's field of service. Growth must take place on the county level. County auxiliaries should not be overwhelmed with a multitude of projects, but should narrow their aims according to the needs of their communities.

A program on "Leadership and Parliamentary Procedure" was presented at the joint dinner for all those attending the workshops. The speakers were Mrs. Chenault, Mrs. R. C. L. Robertson, and Mrs. Herbert L. Mantz. Members of the AMA staff, assistant directors of Field Service and AMPAC were also present to serve as resource and to discuss pertinent and timely AMA activities and projects.

The Maryland Auxiliary representatives found the Regional Workshop very worthwhile and were very much impressed by the group discussions, exchanges of ideas, instruction programs and lectures.

On November 3, 1969, following a Board Meeting at Med-Chi, "Mini" workshops were held for component auxiliaries' chairmen of AMA-ERF, Children and Youth, Health Careers, Legislation, and Membership committees, at which time the Maryland State chairmen attempted to impart their enthusiasm and information garnered from the Regional Workshop to their counterparts in the component auxiliaries.

National Registry For Congenital Rubella Syndrome

With the recent licensing of a live attenuated rubella virus vaccine, the eradication of congenital rubella should be attained in the near future. In order to evaluate the effect of rubella immunization programs on the occurrence of congenital rubella, the National Communicable Disease Center recently established a Nationwide Registry to obtain information on children born with this affliction and any abnormalities they may have.

The Division of Communicable Diseases of the Maryland State Department of Health and Mental Hygiene fully endorses this Registry and requests the cooperation of all Maryland physicians in reporting clinical and epidemiological data on cases of congenital rubella which they may see in their practices.

Two kinds of information are requested. In order to gain some meaningful measure of the incidence of congenital rubella in the pre-vaccine era, the names of children with congenital rubella born between January 1, 1966, and September, 1969, should be submitted. Other information such as address, sex, race, date of birth, date of diagnosis, major handicaps, confirmatory laboratory studies, and reporting official should be included. The report can be completed on the usual Communicable Disease Report Card (CD-1) and sent to the local county health departments.

For children born with suspect congenital rubella after September, 1969, the same report card and information should be submitted. However, since more detailed information is requested on these children, a special form with a stamped return envelope will be mailed to each physician reporting a suspect case born after September, 1969.

The Bureau of Laboratories of the State Health Department is prepared to perform appropriate laboratory tests to confirm the presence of congenital rubella. For further information, please call or write the Division of Communicable Diseases, Maryland State Health Department, 301 W. Preston Street, Baltimore, Md. 21201 (301-383-3010, ext. 8406).

rehabilitation notes

History of Treatment of Spinal Cord Injuries

The modern era in medicine can be said to have started with clinical-pathological correlations. In Baltimore, the first physician to report a series of such correlations was Thomas H. Wright, MD (- 1856), physician to the Alms House. Between 1828 and 1833, he presented a series of articles in the newly founded *American Journal of the Medical Sciences.* These articles consist of case reports followed by a review of current knowledge on the particular disease. They reveal the contemporary use of the history, physical examination, laboratory, drugs, and the state of the gross autopsy at the time.

Quadraplegia in 1827

Dr. Wright's first case report [1] is that of a young girl with a fracture-dislocation between C5 and C6, with complete transection of the spinal cord.

The following communications are simply hospital reports, or a plain record of such cases and results, as seemed of sufficient interest to deserve attention, or were calculated to illustrate some principle, or establish some fact of useful application.

Case 1. Paralysis. Subluxation and Fracture of one of the Cervical Vertebrae.—Priscilla Hilton was admitted into the Baltimore Alms-house, November 14th, 1827, with nearly total paralysis of both superior and inferior extremities. The history obtained of the case was as follows:—A week previous to admission, the patient had fallen down a long flight of stairs, striking, as was supposed, on the back of her neck. The accident was not immediately discovered, and the young woman lay for some time insensible. When found by the family, her consciousness had returned, but she was unable to rise, or to use any of her limbs. From that time the paralysis continued, as when admitted in the Alms-house, nearly total.

In connexion with the general paralysis existing when this patient was admitted, there was a tumid tense state of the abdomen, resembling tympanitis. The bowels were torpid, not having acted since the injury, but from medicinal excitement; the flow of urine free, but altogether involuntary; pulse slow and soft, heat natural, respiration unembarrassed, senses perfect, no pain, but tenderness of the abdomen. On examining the neck of the patient, there was some degree of swelling, and great sensibility to pressure. The head was turned and fixed so as to direct the face somewhat to the left side, and all attempts to restore its natural position gave pain, and was resisted by the patient. She preferred being placed on the right side. **Diagnosis.** *Subluxation, and probably fracture of the fifth or sixth cervical vertebra.*

After this patient had been a day or two in the infirmary, she was observed to sleep naturally for some hours at a time, but was liable to be aroused by spasmodic attacks, and was once or twice affected by convulsive muscular action so violent as to throw her out of bed. She had little appetite, and it was found that efforts to vomit generally ensued

a few hours after eating; the egesta commonly green and foetid. On the third day after her admission the tendency to vomiting became greater; every thing swallowed was soon rejected, and stercoraceous matter in considerable quantity became at last mingled with other substances thrown off by the stomach. The attempts to procure intestinal evacuations by the usual cathartics, with enemata, having failed, Croton oil was ordered, in combination with tinct. rhei and ol. ricini. ℞ Ol. Croton. gutt. ij.—Tinct. rhei. ʒiv.—Ol. ricini, ʒj. ft. mist.—ʒiij. om. hora donec alvus movetur sumendus. The first dose suppressed the vomiting; the second procured two or three sufficient alvine movements. The vomiting did not again occur, and the tympanitic state of the abdomen relaxed very much. But the patient manifested an increased state of prostration, and notwithstanding the liberal use of cordials, gradually sunk, and expired on the following day, the fourth after admission. The mental functions continued free from disorder to the last moment.

A careful dissection disclosed the following circumstances. The entire cervical, and part of the dorsal spine, was cautiously exposed, and the vertebrae freed from muscular matter. It was then obvious that there existed partial dislocation, with fracture, at the junction of the fifth and sixth cervical vertebrae. The inferior anterior margin of the fifth cervical vertebra projected four or five lines in advance of the margin and body of the sixth vertebra. The ligament of the left transverse process of the fifth vertebra was torn up, the articular surface exposed, and the process itself dislocated, and partially separated from the body of the vertebra by fracture. The whole cervical column, above the point of injury, was turned or twisted from right to left, so as to present the range or line of its spinous processes, considerably to the right of the line of the same processes in the column below. Hence the turn of the head and left aspect of the face, noticed as existing when the patient was admitted. The theca spinalis was surrounded, the vertebral canal filled, some distance above and below the point of injury, with semifluid grumous blood. The three lower cervical and first dorsal nerves at their exit between the vertebrae were covered and deeply coloured by the same bloody effusion, and the ligament around the injured articulation stained and blackened by the same matter.

The history of the preceding case, with the facts disclosed by dissection, serves to illustrate some of the doctrines of the nervous functions predicated on physiological anatomy, and concurs with the pathological data inculcated by eminent modern surgeons, in reference to injuries of the spinal column, more especially in regard to injuries of the cervical spine, as determined in their nature and effects by the particular point and location of such injury. In the case above recited, the lesion occurred between the fifth and sixth vertebrae, and voluntary motion was almost wholly extinguished in all the muscles supplied by nerves communicating with the spinal marrow below the point of injury. But respiration was not seriously impaired, indeed not sensibly embarrassed, because the nerves holding dominion over the more important respiratory apparatus, were not directly involved in the injury, deriving their origin above the seat of lesion. Hence the protraction of life for many days, although the accident was fatal in its nature, chiefly perhaps from its influence upon the gastric and alimentary functions.

There were some peculiarities in the present instance, or a few circumstances not analogous to the phenomena described as usually attendant on cases of similar injury. Some distinguished surgeons mention retention of urine as among the consequences of injury of the dorsal and cervical spine. The opposite state existed in the subject of the preceding account; the urine flowed continually and involuntarily. This incontinence has been found to occur frequently in females under circumstances which usually produce retention of urine in males, a result probably caused by the difference in the relative structure and connexions of the urethra. Surgeons also (Mr. Cooper and others) represent involuntary intestinal evacuations as attendant on injuries of the spinal cord. Obstinate constipation, scarcely to be overcome by the most powerful purgatives, attended every period of the case above reported. There existed also in this case more faculty of sensation in the parts below the injury, than is common, according to surgical authorities, in such lesions. The sensibility of some parts, the trunk especially, was preternaturally great, instead of the torpor and insensibility generally described.

Writers on injuries involving the spinal marrow, speak of a considerable degree of tympanitic affection of the abdomen resulting from such violation, attributing the effect to torpor of the gastro-enteritic functions, from defective nervous excitement. Probably, irritation through the ganglionic system of nerves, may be concerned in producing the effect in question. It has been already noticed that the subject of the foregoing history was apparently tympanitic, the abdomen being prominent and tense. The tension lessened a good deal after the full operation of a cathartic, but the enlargement of the abdomen was not sensibly diminished. The continuance of the latter state was explained by dissection. While cutting out the cervical with part of the dorsal spine, it was observed that when the cavity of the thorax was penetrated, a thin serous fluid flowed out of the chest in great quantity, far more than is ever naturally present in that cavity, or accumulated by mere infiltration or transudation after death. On opening the abdomen afterwards, it was

found filled with water, containing as much fluid as is usually present in the mature state of abdominal dropsy.

Here then was hydrothorax and ascites apparently produced by injuries of the cervical spine, and so rapidly produced as to have been matured in a few days. The effusion would appear to have been strictly the consequence of the spinal injury, because the subject seemed to have been, and reported herself to have been in good health at the time of the accident. How shall this phenomenon be solved. Is it to be considered as the result of the violent shock communicated to the system, embarrassing the natural functions, and determined more particularly on the capillary series of circulation and transmission, or shall it be regarded as the consequence of irritation suddenly devolved on the serous tissues of the abdomen and thorax, analogous to that sub-inflammatory diathesis in those textures, which commonly gives occasion to hydropic effusion?

The abdominal viscera in this subject were generally in a natural state, with the following exception. The coats of the bladder were very much thickened, particularly where the peritoneum is reflected over the fundus vesicae. Besides the morbid density of the coats and peritoneal covering of the bladder, numerous patches of quite black matter, of considerable surface and thickness, were deposited upon both the bladder and its peritoneal covering; those deposited were of various extent, and appeared of recent formation. Many spots or patches of the same melonose substance, were observed on the colon and mesentery.

Comments on the Case

This case shows that the history is concerned with the immediate illness, but that some effort was made to obtain a past history.

Physical examination consisted of observation and palpation of the neck, abdomen, and pulse. The skin was felt to see whether the patient was febrile. Respirations were observed. Notation of her mental status was made. Observations of her urinary and bowel output were carefully noted and treatment with Croton oil was directed toward her abdominal distension. The postmortem examination concentrated on examination of the cervical vertebrae and the cord.

In his discussion, Dr. Wright shows a good knowledge of the innervation of the muscles to the extremities and of the diaphragm. He notes that some patients with cord injuries had urinary retention, but felt that this was more common in men because of the structure of the urethra. He was particularly interested in the tympanites. He felt that death might have been caused by "defective nervous excitement" of the abdominal nerves. A second finding of interest was hydrothorax and ascites which he considered a consequence of the "violent shock communicated to the system" by the spinal cord injury. Finally, he mentions thickening of the coat of the bladder where black deposits were present, both on the bladder and on the peritoneal covering. These spots were also present over the colon and mesentery.

The cause of death in this patient is not clear from the protocol. We know now that pulmonary embolus, respiratory failure, and severe pulmonary edema frequently contribute to early death in patients with high cervical injuries. In chronic paraplegia, renal failure associated with pyelonephritis and amyloid disease is the most common cause of death. The only treatment given this patient was directed toward bowel movements. Enemata and light cathartics were unsuccessful; however, Croton oil was administered with good results.

This case demonstrates that, at the time, no effective therapy was available for treating these patients.

It was not until 1833, and again in 1836 *(London Medical Gazette)*, that Curling gave detailed study to and described the results of infection on the bladder and kidney in paraplegics. He recognized that survival was related to severity of infection. In 1856 and 1858 *(Guy's Hospital Reports)*, William Gull added more detail to the description of the kidneys. By 1900, the chief causes of death in chronic paraplegia were established as renal failure associated with infection, bed sores, and amyloidosis, or a combination of these factors. The First World War added few advances in the understanding or treatment of patients with spinal cord injuries. After World War I, however, attention was directed toward treatment of the bladder and urinary tract in such patients.

Quadraplegia in 1930

The following case demonstrates the state of treating spinal cord injuries more than 100 years after Dr. Wright's report.

MWP (CH 2730), the first quadraplegic patient seen by the author, was a 17-year-old white boy who suffered a posterior fracture-dislocation of C5 on C6, with complete transection of the spinal cord, after diving into shallow water at the seashore on July 20, 1930. He experienced immediate numbness and loss of motor power in his legs, and a partial loss in his arms. Examination at a local acute hospital revealed clammy hands, loss of sensation below C6, and loss of motor power in the lower extremities. He was unable to initiate micturition, and could not control his bowels. He was treated

with head traction, and given an indwelling catheter, mineral oil, and a daily enema. He developed a small sacral ulcer.

On January 5, 1931, he was transferred to a local children's hospital. His neurological examination showed no detectable changes. Over the next six years, his condition remained the same. He had intermittent fever usually associated with urinary tract infections, and repeated episodes of headaches, sweating, nausea, and vomiting when catheter drainage was obstructed. The catheter was changed weekly; he was helped into a wheelchair and learned to feed himself and perform some simple diversional activities. Over the next few years, the blood non-protein nitrogen gradually rose. On July 22, 1933, he had a suprapubic catheter placed, in an attempt to prevent recurrent urinary tract infections. On November 20, 1934, an intravenous pyelogram showed tremendous hydro-ureters and hydronephrosis on both sides. Thereafter, he gradually developed increasing levels of non-protein nitrogen, and died of uremic poisoning on March 13, 1937.

Postmortem examination showed a healed decubitus ulcer and numerous small decubitus ulcers over the lower back. The spinal column and cord were extensively examined. There was a posterior luxation of C5 on C6. The cord was atrophic below this level. The kidneys were uniformly peppered with small abscesses, the largest being about 1.5 cm in diameter. There were small calculi in both pelvises. The calyces were greatly dilated and the cortex of the kidneys was thin. The ureters were dilated, and the bladder wall, about 1 cm in thickness, was chronically infected. The capacity of the bladder was 30 cc. Microscopic examination of the kidneys showed chronic pyelonephritis and abscess formation. The liver was normal. There was moderate chronic prostatitis. The bladder wall was enormously thickened with infiltration of leukocytes. The spinal cord was degenerated below C5.

Comments on the Case

This is an example of superior care of a traumatic quadriplegic in the pre-antibiotic days. One small sacral ulcer developed in the acute hospital where the patient was first hospitalized, but it was healed by good nursing care without Stryker frame, grafting, or other modern methods. Small ulcers appeared very late in the course of the injury, when the patient was uremic, but decubitus ulcers were not a major problem. No neurosurgical or orthopedic procedures were performed other than head traction. Treatment of the urinary tract was accomplished merely by insuring free drainage of the bladder. With these simple procedures, the patient survived nearly seven years.

Conclusion

Thompson-Walker's work with British soldiers in the first World War [2] showed that of 339 patients with spinal injuries, 160 died of urinary infection eight to ten weeks after admission to a hospital. In 1937,[3] he estimated the total mortality rate from urinary sepsis to be 80%. He noted that an acute hemorrhagic cystitis often led to a septic pyelonephritis early after admission, followed by death within a week. Acute exacerbations of septic pyelonephritis occurred in patients living for longer periods.

Frazier and Allen [4] describe 442 deaths in 717 American soldiers with spinal injuries in 1918. Estimates for the death rate in the American soldiers were similar to those of Thompson-Walker. About 80% died within the first few weeks as a result of infection, bed sores, and catheterization.

The modern era in treatment of spinal cord injuries started with Munro's work in 1943. Munro [5] reported on the use of tidal drainage and stated that "death from genito-urinary sepsis would not be countenanced in my service." The now classic work of Sir Ludwig Guttmann [6] in 1944, together with the introduction of antibiotics, greatly improved the survival of patients who suffered spinal cord injuries in World War II.

Part 2

The Electrocardiogram in Clinical Alterations of Potassium Homeostasis

RALPH WEBER, MD
Baltimore

In K^+ depletion, there is a marked increase in the duration of phase 3 (MAP) so that the repolarization slope changes from a convex to concave configuration and a significant part of repolarization (last portion of "electrical systole") shifts into phase 4 ("electrical diastole").

Contrary to earlier beliefs, no significant change occurs in the duration of any of the measured EKG intervals, but there are significant changes in voltage and configuration of the ST segments as well as the T and U waves. In general, when $[K^+]$ is at, or slightly below 3.0 me/1 ("moderate K^+ depletion") a relatively small number (10%) of patients display characteristic EKG changes. When $[K^+]<2$ me/1 ("advanced K^+ depletion") $>80\%$ of patients have characteristic changes in EKG. The most consistent change is the appearance of a prominent U wave. An absolute increase in amplitude of 1mm or more in a limb lead (generally II but, occasionally, III or AVF) and especially in the precordial leads which normally reveal tallest waves (usually V3 but occasionally V2 or V4) is characteristic (often higher than the T in that lead). As K^+ depletion progresses there is lowering of the ascending limb of the T wave; as long as a portion of T wave remains upright, ST remains either isoelectric or may "sag" with an upward concavity. As the T becomes progressively lower the ratio of U to T wave amplitude exceeds 1. Simultaneous operation of decreasing T and increasing U waves may go through a variable sequence of changes with U and T waves of equal amplitude ("double humped" contour of bactrian camel) sometimes followed by or associated with a notch of T (rendering a "triple contour" similar to a rolling countryside), followed by U wave growing at the expense of T wave. The ST segment "sagging" gradually becomes obviously depressed (0.5mm) and the concavity of the ST segment is directed downward, especially as T becomes more apparently inverted. Therefore, the most typical pattern of K^+ depletion is a U wave of increased voltage associated with an ST segment and T wave of opposite polarity to the U wave; this appearance has been compared

with a letter "S" lying on its side and is characteristically seen in V_3-V_4. When there is some doubt whether the second of a pair of summits is a T or U wave, the time interval between summits is useful —if <40% of the time from the beginning of the QRS to the second summit, it is a T wave. Most other conditions that simulate the electrocardiographic findings of K^+ depletion can be distinguished on clinical grounds. In tachycardias without K^+ depletion (often associated with ST depression, low T waves), the U wave also tends to diminish in amplitude unless there is associated K^+ depletion (with its attendant prominent U waves). In the latter circumstance, the superimposition of the subsequent P wave (which becomes tilted because its onset is farther from the baseline than its end) is often a clue. Certain conditions (such as cerebrovascular accidents and bradycardias) may be associated with an increased U wave amplitude without K^+ depletion but, under these clinical circumstances, there is apt to be an increase in amplitude of the T wave and the U/T ratio remains <1. When left ventricular preponderance is associated with increased U wave amplitude and ST segment depression, the ST segment is usually elevated in V1-V3 if K^+ depletion is not present. If the latter is present, ST segment will be depressed in V1-V3. ST segment depression alone can be caused by many circumstances other than K^+ depletion (such as digitalis) but an increased U wave amplitude is not apt to be noted. Since quinidine therapy is often associated with an increased U wave amplitude (and this may be true of other anti-arrhythmic agents) and is sometimes given in association with digitalis, an electrocardiographic diagnosis without supplementary clinical information is not possible. Diminished $[K^+]$ enhances automaticity of ectopic supraventricular and ventricular pacemakers and prolongs AV conduction (both of which are enhanced by digitalis and by variable degrees of structural changes brought about by diseases that damage the conducting system). In general, however, the arrhythmias that often occur in association with potassium depletion are attributable to the latter factors and, although common in experimentally induced potassium depletion states, are uncommonly seen in the clinic. Interesting isolated cases of impaired AV conduction in familial periodic paralysis have been reported and favorable response to Atropine has raised the possibility that K^+ depletion may have exerted its effect by altering vagal tone.

Since renal failure is usually present in K^+ intoxication, the role of extracellular concentration of other ions (especially Na^+) often must be considered. It is well to remember that with ↓ $[Na^+]$ EKG changes of potassium intoxication are apt to be seen at levels <7 me/L whereas with normal $[Na^+]$ changes are not apt to be seen at these levels and with an ↑ $[Na^+]$ changes are not likely to be seen at levels of $[K^+]$ <7.5 me/L. Furthermore, the changes of K^+ intoxication are often augmented by an associated clinical state of acidosis and ↓ $[Ca^{++}]$ (commonly seen in terminal renal disease) and diminished by treatment with NSS, glucose, HCO_3, insulin, and Ca^+. When $[K^+]$ >6 me/L, there is an increased permeability of the cell membrane to K^+ associated with K^+ efflux, an increased velocity and slope of phase 3 of MAP and a decreased duration of a repolarization. The earliest electrocardiographic manifestation of this "accelerated repolarization" is the presence of narrow more symmetric tented peaked T waves (sometimes of greater amplitude than the preceding "R" waves); shortened T wave duration and diminished amplitude of the U wave also become evident. The peaked T waves are most often seen in II, III, V_2-V_4 (in children or young adults with normally inverted T waves in V_2-V_3, the T is apt to become more sharply inverted). When serum Na^+ is normal, the peaked T waves are apt to be seen between 7-8 me/L (although sometimes at lower concentrations). These T waves are characteristically symmetric with a low or normal ST junction and the ascending and descending limbs are of the same contour causing the tent-like shape. This is in contradistinction to the tall precordial T waves in normal young people (especially athletes in training); under these circumstances the T wave tends to be asymmetric with elevation of ST junction and the ascending limb of T is less steep than the descending limb. Peaked T waves are also seen in association with acute myocardial ischemia (especially of the posterior and posterolateral left ventricular wall probably related to the observed transient increase of K^+ in coronary sinus blood related to local release of intracellular K^+ by breakdown of ischemic muscle fibers), conditions of left ventricular diastolic "overload" and cerebrovascular accident accidents; all of these conditions are apt to be associated with prolongation of QT_c (which is normal or ↓ when peaked T waves are the only EKG finding in K^+ intoxication) and the clinical diagnosis is usually obvious. Other conditions associated with peaked T waves (supraventricular tachycardia, bradycardia, intermediate stages between flattened and normal T in occasional patients recovering from acute rheumatic carditis) are also usually diagnosed at the bedside. When the level of $[K^+]$ approaches 7 me/L, some QRS widening tends to appear and its progression is well correlated with subsequent further ↑ $[K^+]$ because there is a progressive ↓ in rp and upstroke velocity (phase O, MAP) with attendant slowing of intraventricular conduction. Because there is depressed conduction throughout the myocardium (rather than a focal bundle branch) uniform widening of the QRS is seen with alteration of both initial and terminal

portions. Accordingly, wide S in "left precordial" leads differentiates the QRS from those of typical LBBB and the wide initial portion helps to distinguish from typical RBBB. A combination of tall symmetric peaked T waves with a wide QRS and the presence of S waves in the "left precordial" leads is quite suggestive of K^+ intoxication and may account for the high degree of diagnostic accuracy in some studies. As $[K^+]$ exceeds 7 me/L, the duration of P ↑ and its amplitude ↓. As $[K^+]$ approaches 8-9 me/L there is suppression of diastolic repolarization (phase 4, MAP) of pacemaker fibers and therefore more time is needed to reach tp and, by keeping diastolic repolarization at a potential more negative than tp, sufficient slowing of diastolic repolarization can occur to bring about complete suppression of pacemaker activity. The disappearance of P at time when QRS is still reasonably defined supports the notion that non-specialized atrial fiber excitability is abolished at lower $[K^+]$ levels than ventricular fibers. The disappearance of the P wave also renders AV conduction disturbances of little diagnostic significance in K^+ intoxication since, when $[K^+] > 9$ me/L more obvious changes in QRS have occurred; the normal angularity of QRS has given way to a sinusoidal QRS-T. At $[K^+]$ 12-14 me/L ventricular fibrillation (often heralded by ↑QRS of > 50%) or asystole (especially when ↑ in $[K^+]$ has been slow) ensues.

SKIN PROBLEMS

Caused by itching due to:

Dry Eczema	Acne
Chafing	Ivy Poisoning
Minor Burns	Cold Sores
Athlete's Foot	Heat Rash
Dry Skin	Diaper Rash
Wind Burn	Chapping
Insect Stings	Hemorrhoids

For Safe, Sure, Speedy Relief — — Get RESINOL GREASELESS!

Medical Scientists have conquered 6 dread diseases in the past decade, but they are largely in the dark, they admit, in finding relief for one age-old ailment—itching

New remedies containing antibiotics have been tested, but have often caused side effects which are worse than itching skin. After many years of research and testing, Resinol Greaseless Cream was developed. . . . A doctor's formula containing safe yet powerful ingredients, Resinol Greaseless contains an amazing, proven "anti-itch" medication called Resorcin, which quickly and effectively relieves most any kind of itching. Try Resinol Greaseless . . . You'll be delighted to find that it really works! At all drug stores. Buy a tube today.

Convalescing . . . but still a long way to go. Anxiety can make it even longer.

Convalescence following medical or surgical procedures may be almost endless to an anxious patient. And, indeed, anxiety with some patients actually retards progress—for example, by inducing insomnia and reducing cooperation.

As physicians have found during nearly 15 years of widespread use, Equanil may be a beneficial part of aftercare. It helps relieve anxiety and tension, thus often aiding your primary therapy.

Indications: For use in management of anxiety and tension occurring alone or as accompanying symptom complex to medical and surgical disorders and procedures. Though not a hypnotic, fosters normal sleep through antianxiety and related muscle-relaxant properties.

Contraindications: History of sensitivity to meprobamate.

Important Precautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use has been reported to result in dependence or habituation in susceptible persons, as alcoholics, ex-addicts, and other severe psychoneurotics. After prolonged excessive dosage, reduce dosage gradually to avoid possibly severe withdrawal reactions. Abrupt discontinuance of excessive doses has sometimes resulted in epileptiform seizures.

Warn patients of possible reduced alcohol tolerance, with resultant slowing of reaction time and impairment of judgment and coordination.

Reduce dose if drowsiness, ataxia or visual disturbance occurs; if persistent, patients should not operate vehicles or dangerous machinery.

Side Effects include drowsiness, usually transient; if persistent and associated with ataxia, usually responds to dose reduction; occasionally concomitant CNS stimulants (amphetamine, mephentermine sulfate) are desirable. Allergic or idiosyncratic reactions are rare, but such reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Previous history of allergy may or may not be related to incidence of reactions. Mild reactions are characterized by itchy urticarial or erythematous maculopapular rash, generalized or confined to groin. Acute nonthrombocytopenic purpura with cutaneous petechiae, ecchymoses, peripheral edema and fever have been reported. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically as with epinephrine, antihistamine and possibly hydrocortisone. Aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia have occurred rarely, almost always in presence of known toxic agents. A few cases of leukopenia, usually transient, have been reported on continuous administration.

Meprobamate may sometimes precipitate grand mal attacks in patients susceptible to both grand and petit mal. Extremely large doses can produce rhythmic fast activity in the cortical pattern. Impairment of accommodation and visual acuity has been reported rarely. After excessive dosage for weeks or months, withdraw gradually (1 or 2 weeks) to avoid recurrence of pretreatment symptoms (insomnia, severe anxiety, anorexia). Abrupt discontinuance of excessive doses has sometimes resulted in vomiting, ataxia, tremors, muscle twitching and epileptiform seizures. Prescribe very cautiously and in small amounts for patients with suicidal tendencies. Suicidal attempts have resulted in coma, shock, vasomotor and respiratory collapse and anuria. Excessive doses have resulted in prompt sleep; reduction of blood pressure, pulse and respiratory rates to basal levels; and occasionally hyperventilation. Treat with immediate gastric lavage and appropriate symptomatic therapy. (CNS stimulants and pressor amines as indicated.) Doses above 2400 mg./day are not recommended.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. (All tablets also available in REDIPAK® [strip pack], Wyeth.) Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

Blackjack Blues

Looking forward to that forthcoming trip to Las Vegas and a little gambling? Beware! Other hazards besides beady-eyed con men await you in those dimly lit casinos.

According to the *New Scientist*, June 5, page 510, "It's no easy life being a confirmed gambler. Crap shooters who spend marathon sessions at the table suffer from varicose veins and other circulatory disorders of the legs. Really long-serving dice throwers can even develop dependent edema, a sort of waterlogging of the lower limbs. Roulette buffs and card players can be stricken by a disease called 'blackjack dermatitis,' which is caused by a reaction to the chromic salts used to dye the green felt of the tables. Gamesters addicted to one-armed bandits have been afflicted by 'slot machine arm,' brought on by prolonged handle-pulling, and considered to be more painful than tennis elbow. And the more sensitive amongst them are plagued by the unpleasant symptoms of nickel allergy resulting from long periods of clutching coins in slot-feeding hands."

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the MARYLAND STATE MEDICAL JOURNAL.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the JOURNAL and are not returned. The JOURNAL is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, MARYLAND STATE MEDICAL JOURNAL, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a minimum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the JOURNAL. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number. the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with JOURNAL style.

Statements made or opinions expressed by any contributor in any article or feature published in the JOURNAL are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the MARYLAND STATE MEDICAL JOURNAL is protected by copyright and may not be reproduced without the written permission of both the author and the JOURNAL.

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the Maryland State Medical Journal.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the Journal and are not returned. The Journal is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, Maryland State Medical Journal, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a minimum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the Journal. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number, the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with Journal style.

Statements made or opinions expressed by any contributor in any article or feature published in the Journal are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the Maryland State Medical Journal is protected by copyright and may not be reproduced without the written permission of both the author and the Journal.

after surgery...

To restore tissue depletion of Vitamin B Complex and ascorbic acid induced by the physiological stress of surgery, illness or injury—Increases the recuperative power of convalescence.

from the discord of anxiety...

to emotional harmony

Before prescribing, please consult complete product information, a summary of which follows:

INDICATIONS: Indicated when anxiety, tension and apprehension are significant components of the clinical profile.
CONTRAINDICATIONS: Patients with known hypersensitivity to the drug.
WARNINGS: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.
PRECAUTIONS: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.
ADVERSE REACTIONS: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido--all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

with the aid of antianxiety

Librium®
(chlordiazepoxide HCl)
5-mg, 10-mg and 25-mg capsules

In an age of swift change and challenge, susceptible individuals may experience varying degrees of excessive anxiety. The resulting emotional stress may precipitate significant functional disorders or complicate existing organic disease. In properly individualized maintenance dosage, Librium (chlordiazepoxide HCl) quickly helps relieve anxiety and apprehension, provides useful adjunctive therapy in psychophysiologic disorders. In long clinical experience, Librium has demonstrated a wide margin of safety.

Also available:
Libritabs®
(chlordiazepoxide)

the right attitude:

The right attitude has earned us an enviable reputation in Baltimore's wide spectrum of health care establishments. We feel that our approach to the problems of the elderly, chronically ill, and convalescent patient makes us different.

Our *people* are not only doing a job but also giving of themselves beyond the call of duty to provide our guests with more than the average amount of service expected.

If the right attitude is what you're looking for . . . concerning a day & night vigil by professional nurses . . . individually programmed meals under the control of our staff dietician — physical, occupational, recreational therapy designed to reach a goal in the patient's care and well-being . . . a pleasant home-away-from-home atmosphere . . . Edgewood Nursing Home should be your first preference.

WATCH FOR OUR GRAND OPENING:

By the first of the year — our completely new 100 bed facility will be finished — we are Baltimore's most centrally located nursing home. Minutes from Towson. Roland Park, Homeland and all of Northern Baltimore's hospitals.

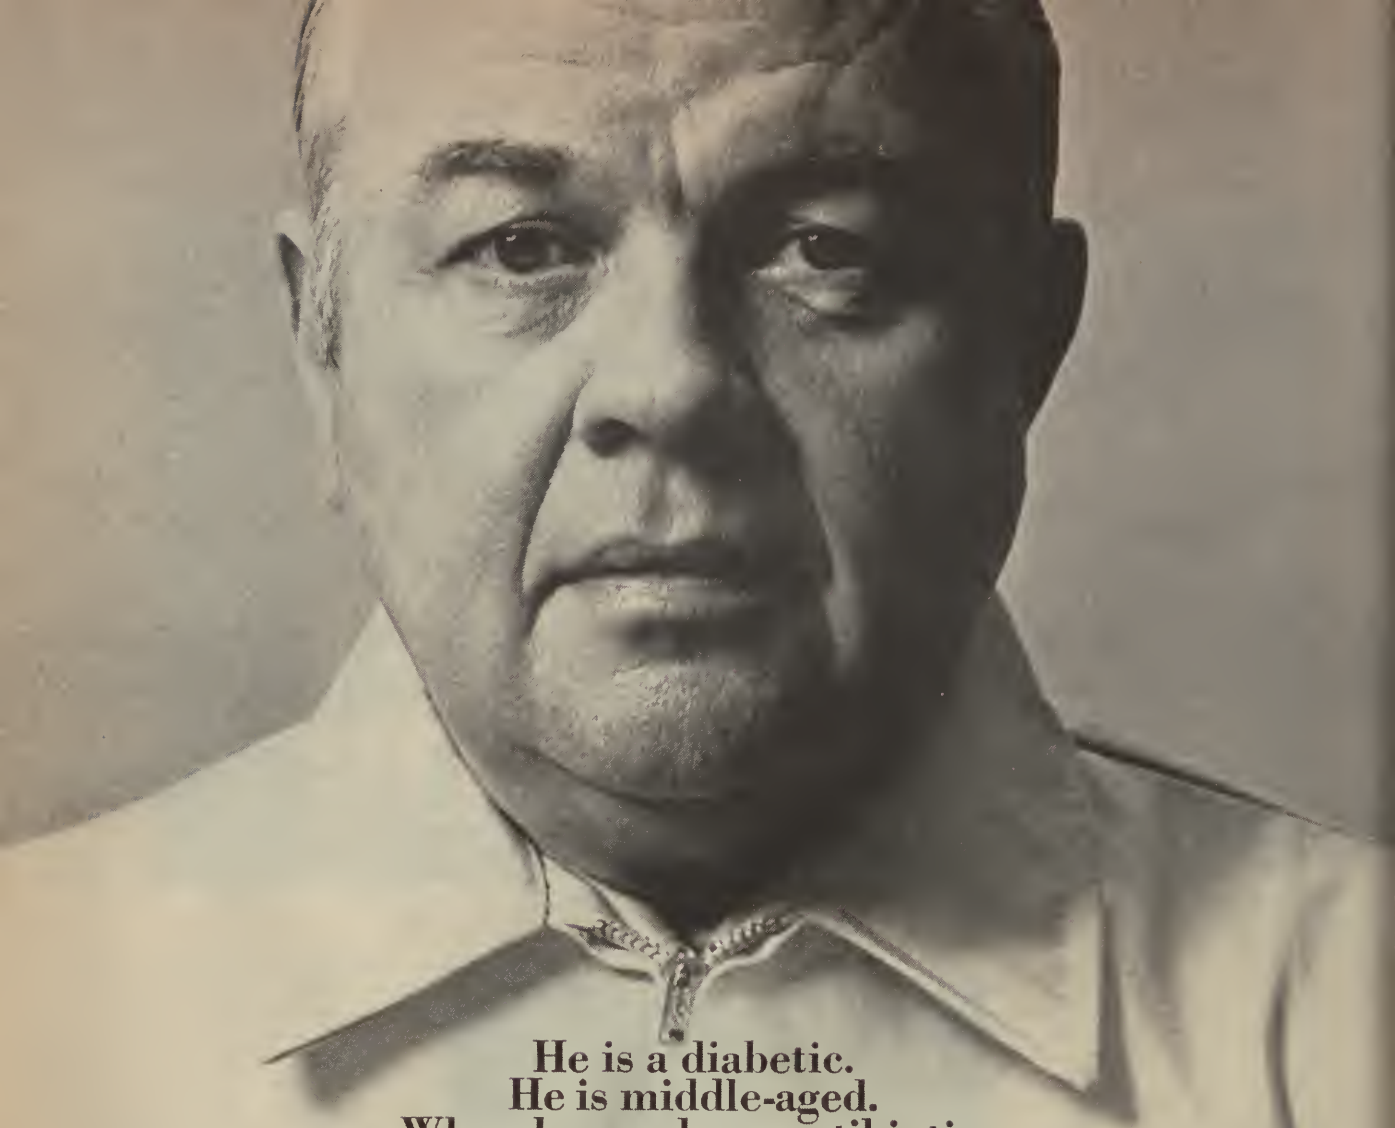
NURSING & CONVALESCENT HOME
6000 Bellona Avenue, 323-4223

Lutrexin®

HW&D BRAND OF LUTUTRIN

3000 UNIT TABLETS

IN THE TREATMENT OF FUNCTIONAL DYSMENORRHEA AND SELECTED CASES OF PREMATURE LABOR AND 2ND AND 3RD TRIMESTER THREATENED ABORTION



- LUTREXIN, the non-steroid "uterine relaxing factor" has been found to be useful by many clinicians in controlling abnormal uterine activity.
- Literature on indications and dosage available on request.
- No side effects have been reported, even when massive doses (25 tablets per day) were administered.
- Supplied in bottles of twenty-five 3,000 unit tablets.

(In vivo measurement of Lutrexin on contracting uterine muscle of the guinea pig.)

HYNSON, WESTCOTT & DUNNING, INC. BALTIMORE, MARYLAND 21201

(LTR23)

He is a diabetic.
He is middle-aged.
When he needs an antibiotic he may be a candidate for

DECLOSTATIN® 300 b.i.d.

Demethylchlortetracycline HCl 300 mg and Nystatin 500,000 units CAPSULE-SHAPED TABLETS Lederle

To guard susceptible patients against intestinal monilial overgrowth during broad-spectrum therapy—the protection of nystatin is combined with demethylchlortetracycline in DECLOSTATIN.

For your susceptible candidates, prescribe DECLOSTATIN—the broad-spectrum therapy that prevents monilial overgrowth.

Effectiveness: Because its antibacterial component is DECLOMYCIN Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, Nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

maryland state MEDICAL JOURNAL

VOLUME 19 FEBRUARY 1970 NUMBER 2

CONTENTS:

Joint Anesthesia Study Committee—Organization and Function, Calbert T. Seebert, MD 46

Anesthesia—1970, Martin I. Gold, MD 48

"The anesthesiologist as a physician has existed for almost 125 years, but it is only within the last few decades that anesthesia has become recognized as a specialty and its beneficial effects appreciated. The primary change has been in the area of the patient's safety. Knowledge of physiology and pharmacology was joined to the technique and administration of anesthetics, and both have matured ino a philosophy of the management of patients under anesthesia."

Predicting the Need for Ventilatory Assistance, Joseph S. Redding, MD, and Ronald W. Yakaitis, MD 53

"Normal man is capable of markedly increasing rate and depth of breathing in response to increased need. This ventilatory reserve may be diminished by anything which impairs function of the neural mechanisms regulating breathing, reduces the mechanical efficiency of the thoracic cage, or increases the resistance to flow in the airways or lungs . . . . The anesthesiologist must be able to anticipate the likelihood of the patient needing postoperative ventilatory support."

Problems in the Management of Drowning Victims, Joseph S. Redding, MD, Ronald W. Yakaitis, MD, and C. Hershel King, MD.. 58

"Over 6,000 people die from drowning each year in the United States. Most of them are young and in good health. No single disease kills as many people under 24 years old. In spite of the magnitude of the problem, relatively little is known about this fatal accident."

in cardiac edema

Dyazide®

Trademark

Each capsule contains 50 mg. of Dyrenium® (brand of triamterene) and 25 mg. of hydrochlorothiazide.

gets the water out

spares the potassium

Before prescribing, see complete prescribing information in SK&F literature or *PDR*.

Contraindications: Pre-existing elevated serum potassium. Hypersensitivity to either component. Continued use in progressive renal or hepatic dysfunction or developing hyperkalemia.

Warnings: **Do not use dietary potassium supplements or potassium salts unless hypokalemia develops or dietary potassium intake is markedly impaired.** Enteric-coated potassium salts may cause small bowel stenosis with or without ulceration. Hyperkalemia (>5.4 mEq/L) has been reported, in 4% of patients under 60 years, in 12% of patients over 60 years, and in less than 8% of patients overall. Rarely, cases have been associated with cardiac irregularities. Accordingly, **check serum potassium and BUN during therapy, particularly in patients with suspected or confirmed renal or hepatic insufficiency (e.g., certain elderly or diabetics). If hyperkalemia develops, substitute a thiazide alone. If spironolactone is used concomitantly with 'Dyazide', check serum potassium frequently**—their combined use can cause potassium retention and sometimes hyperkalemia. Two deaths have been reported in patients on such combined therapy (in one, recommended dosage was exceeded; in the other, serum electrolytes were not properly monitored). Observe regularly for possible blood dyscrasias, liver damage or other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving Dyrenium (triamterene, SK&F). Rarely, leukopenia, thrombocytopenia, agranulocytosis, and aplastic anemia have been reported with the thiazides. Watch for signs of impending coma in acutely ill cirrhotics. Thiazides are reported to cross the placental barrier and appear in breast milk; thus adverse reactions which have occurred in adults may occur in the fetus or newborn infant. Rarely, thrombocytopenia or pancreatitis has developed in newborn infants whose mothers had received thiazides during pregnancy. When used during pregnancy or in women who might bear children, weigh potential benefits against possible hazards to fetus.

Precautions: Do periodic serum electrolyte determinations. Do periodic blood studies in cirrhotics with splenomegaly. Antihypertensive effects may be enhanced in postsympathectomy patients. The following may occur: hyperuricemia and gout, reversible nitrogen retention, decreasing alkali reserve with possible metabolic acidosis, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), digitalis intoxication (in hypokalemia). Use cautiously in surgical patients. Adjust dose of antihypertensive agents given concomitantly.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth; anaphylaxis; rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting (may indicate electrolyte imbalance), diarrhea, constipation, other gastrointestinal disturbances. Rarely, necrotizing vasculitis, altered carbohydrate metabolism, hyperbilirubinemia, paresthesias, icterus, pancreatitis, and xanthopsia have occurred with thiazides alone.

Supplied: Bottles of 100 capsules.

executive secretary's newsletter

February, 1970

DEADLINE FOR ANNUAL MEETING RESOLUTIONS

The deadline for receiving resolutions to be considered by the House of Delegates at the Faculty's Annual Meeting is

FRIDAY, FEBRUARY 6, 1970

REFERENCE COMMITTEE MEETING

The Reference Committee, which will evaluate and hear comments on all resolutions introduced for consideration by the House of Delegates, will hold its meeting on Thursday, February 26, 1970 at 8:00 PM, in the Faculty building.

All interested parties are invited to attend and express their views.

SHEEN AWARD

Individuals are invited to submit names to the American Medical Association for consideration for the Sheen Award. The cut-off date is March 15, 1970.

The award, a $10,000 cash gift, is given annually through the AMA for recognition of outstanding contributions to medicine.

MEDICAID CLARIFICATIONS

Information has been received that the Medicaid program authorizes the dispensing of disposable syringes and needles, when prescribed by a physician on Form MS-6.

MEDICAID FORM REVISIONS

The State Department of Health and Mental Hygiene is currently revising the MS-4, MS-6, and MS-9 forms (all forms used by physicians for Medicaid patients).

Those physicians who are vitally interested in suggesting changes or modifications in the forms should contact the Faculty office so that the information can be transferred to the appropriate parties in the Department.

CHARTER TRIPS

There are still several openings for the Faculty's trip to the Orient, leaving Baltimore on May 1, 1970.

CHARTER TRIPS (cont'd)

For further information, call Mrs. Beverly Wolins at Travel Guide Agency - 727-1696.

Dates for the regular fall European trip have been tentatively scheduled for September 10-18. Further details will be available at a later date.

FIRST ISSUE OF THE ASSEMBLYMAN

The first issue of The Assemblyman, containing full details on the 1970 General Assembly session, is in the mail. Look for this important information.

PUBLIC SPEAKING COURSE

A seminar for Public Speakers will be sponsored by the Faculty and the American Medical Association on Wednesday, April 22, 1970 at the Faculty Building. The all-day session is free except for luncheon costs. Preregistration forms will be mailed in February.

The program will include audio visual tape equipment for instant replays for the evaluation of the participants' performances.

BENEFITS OF FACULTY PROFESSIONAL LIABILITY INSURANCE

Most states are experiencing sharp rises in professional liability insurance premiums--Maryland is no exception. Bureau rates indicate that in Class V, rates for such insurance ($100,000/$300,000) are $725. Under the Faculty-sponsored program the rate is $479. This reflects a financial saving to the physician of over $245.

While comparable savings are not quite as high in other classes, there are lower premiums..... ALL A BENEFIT OF YOUR FACULTY'S ACTIVITY.

PEER REVIEW AND UTILIZATION REVIEW

The Faculty is currently organizing a special committee to consider Peer and Utilization Review. Its initial discussions will be devoted primarily to review of Medicare and Medicaid activity. It is conceivable that the committee's scope will be expanded to include other related areas needing review.

Any persons interested in participating should advise the Faculty President or the Faculty Staff.

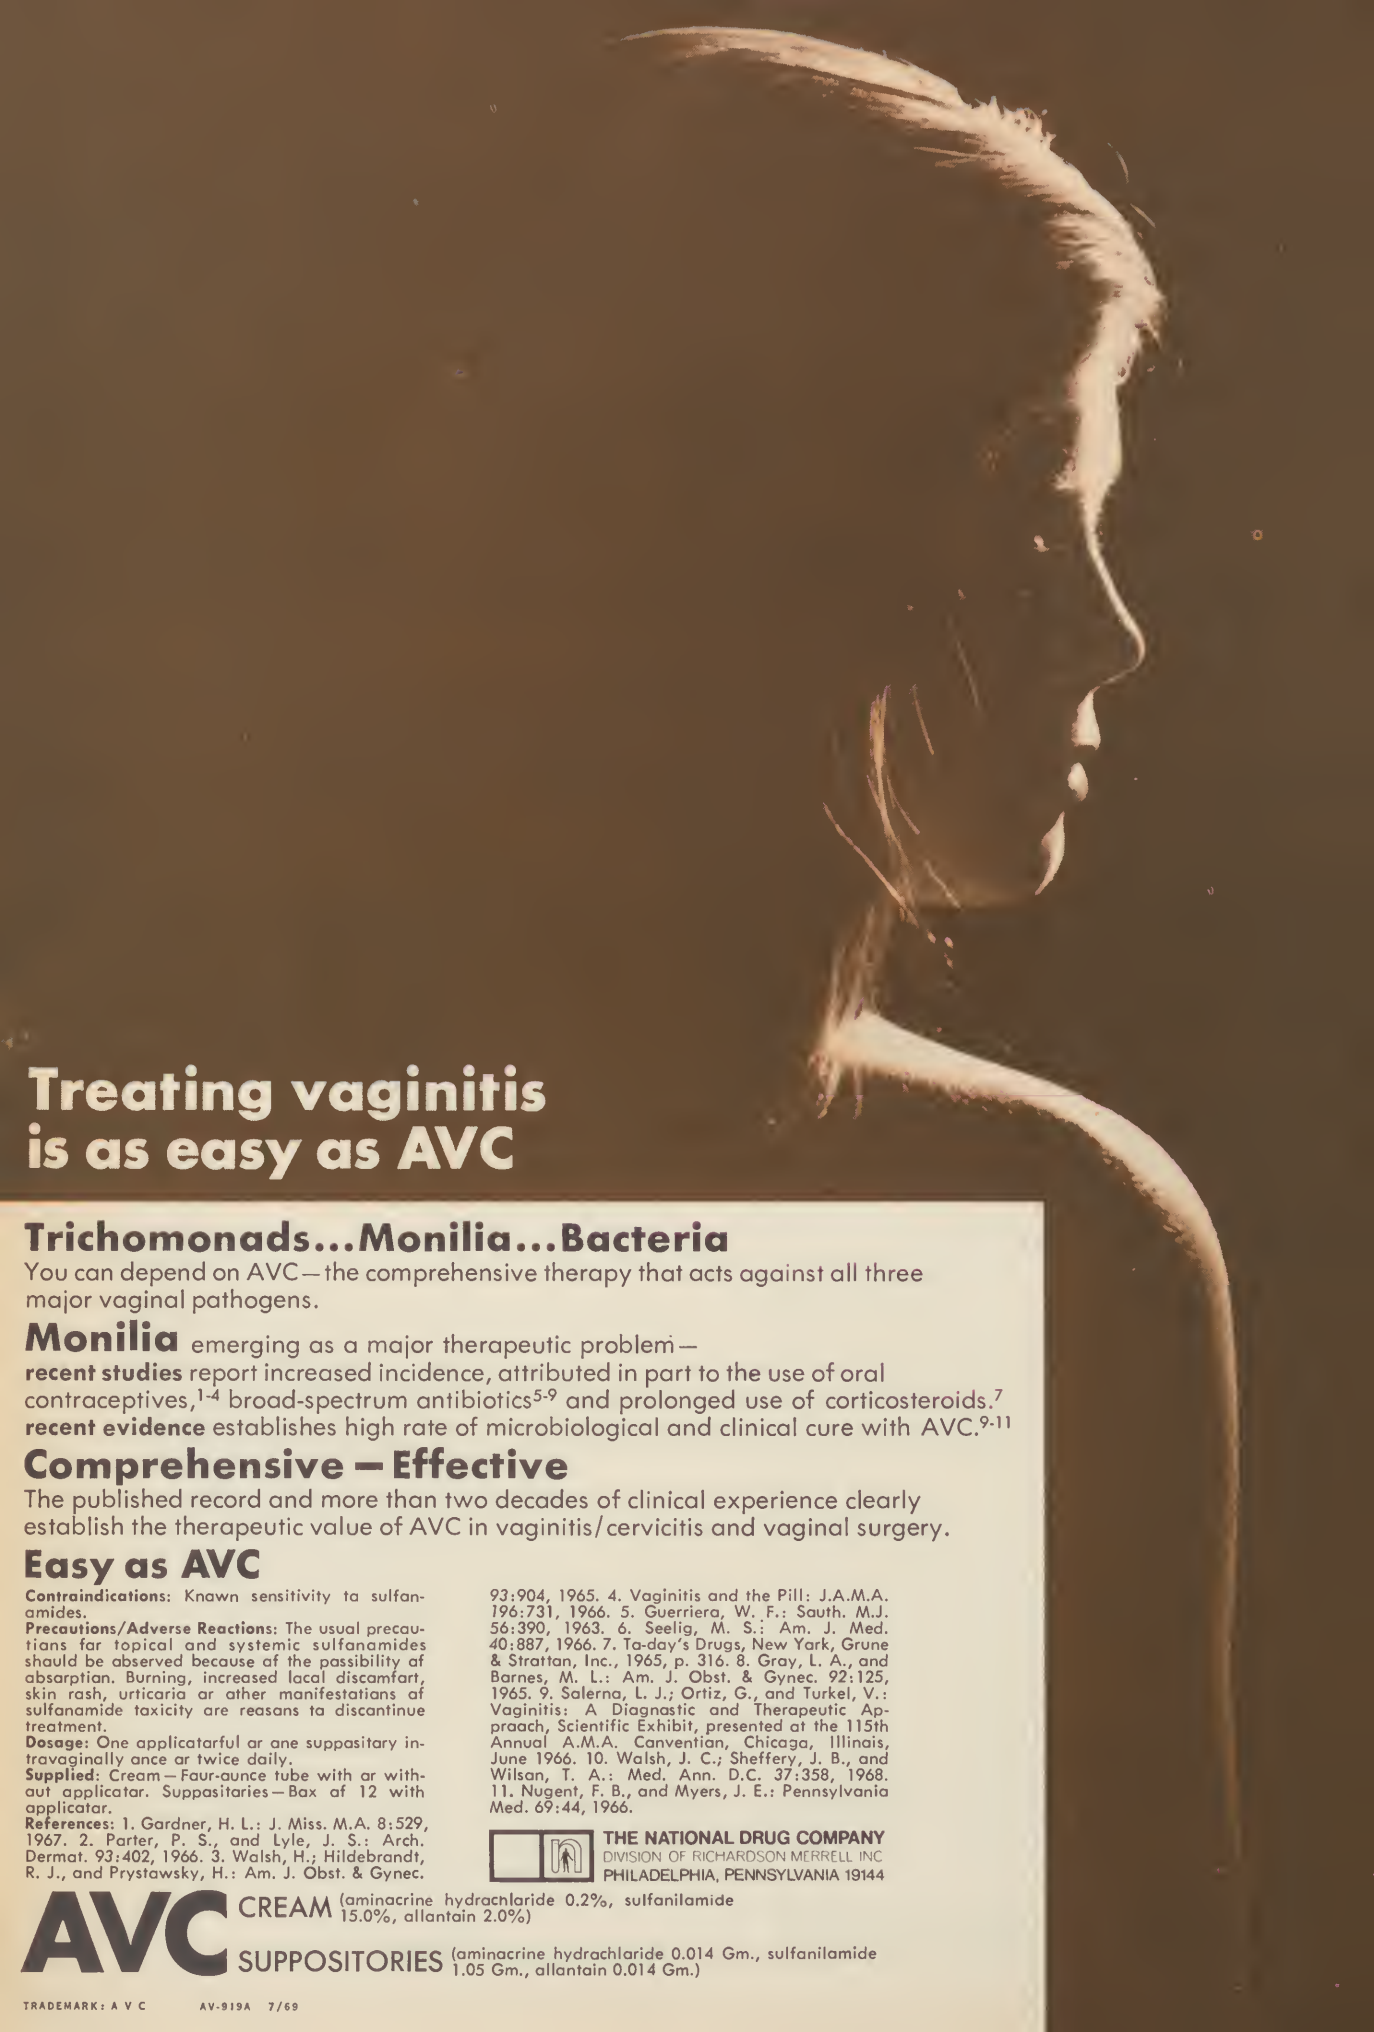
Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD



One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.

Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

THE NATIONAL DRUG COMPANY
DIVISION OF RICHARDSON-MERRELL INC.
PHILADELPHIA, PENNSYLVANIA 19144

Quinamm™
(quinine sulfate 260 mg., aminophylline 195 mg.)

Specific therapy for night leg cramps

Treating vaginitis is as easy as AVC

Trichomonads...Monilia...Bacteria

You can depend on AVC—the comprehensive therapy that acts against all three major vaginal pathogens.

Monilia emerging as a major therapeutic problem—
recent studies report increased incidence, attributed in part to the use of oral contraceptives,[1-4] broad-spectrum antibiotics[5-9] and prolonged use of corticosteroids.[7]
recent evidence establishes high rate of microbiological and clinical cure with AVC.[9-11]

Comprehensive — Effective

The published record and more than two decades of clinical experience clearly establish the therapeutic value of AVC in vaginitis/cervicitis and vaginal surgery.

Easy as AVC

Contraindications: Known sensitivity ta sulfanamides.
Precautions/Adverse Reactions: The usual precautians far topical and systemic sulfanamides shauld be abserved because af the passibility af absarptian. Burning, increased lacal discamfart, skin rash, urticaria ar ather manifestatians af sulfanamide taxicity are reasans ta discantinue treatment.
Dosage: One applicatarful ar ane suppasitary intravaginally ance ar twice daily.

Man in space, now fait accompli, re-emphasizes the importance of Uro-Phosphate therapy. Research into the effect of space travel on the astronaut reveals that weightlessness causes loss of bone calcium. As the bones are required to bear less and less of the weight of the body they lose calcium, increasing the calcium content of the urine. When physical activity is reduced, the acidity of the urine should be adjusted to keep increased calcium in solution . . . . a prophylaxis to prevent kidney or bladder calculi.

Uro-Phosphate®

NOW A SUGAR-COATED TABLET

Each tablet contains: METHENAMINE, 300 mg.; SODIUM ACID PHOSPHATE, 500 mg.

Uro-Phosphate gives comfort and protection when inactivity causes discomfort in the urinary function. It keeps calcium in solution, preventing calculi; it maintains clear, acid, sterile urine; it encourages complete voiding and lessens frequency when residual urine is present.

Uro-Phosphate contains sodium acid phosphate, a natural urinary acidifier. This component is fortified with methenamine which is inert until it reaches the acid urinary bladder. In this environment it releases a mild antiseptic keeping the urine sterile.

Uro-Phosphate is safe for continuous use. There are no contra-indications other than acidosis. It can be given in sufficient amount to keep the urine clear, acid and sterile. A heavy sugar coating protects its potency.

Dosage:

For protection of the inactive patient 1 or 2 tablets every 4 to 6 hours is usually sufficient to keep the urine clear, acid and sterile.

2 tablets on retiring will keep residual urine acid and sterile, contributing to comfort and rest.

A clinical supply will be sent to physicians and hospitals on request.

THE COST OF **AMBAR EXTENTABS** IS APPROXIMATELY ONE HALF THAT OF OTHER LEADING APPETITE SUPPRESSANTS

AN IMPORTANT FACTOR IN LONG TERM THERAPY

CONTROL FOOD AND MOOD ALL DAY LONG WITH A SINGLE MORNING DOSE

AMBAR #2 EXTENTABS®

methamphetamine HCl 15 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

One Ambar Extentab before breakfast can help control most patients' appetite for up to 12 hours. Methamphetamine, the appetite suppressant, gently elevates mood and helps overcome dieting frustrations. Phenobarbital, the sedative in Ambar, controls irritability and anxiety...helps maintain a state of mental calm and equanimity. Both work together to ease the tensions that erode the willpower during periods of dieting.

Also available: Ambar #1 Extentabs®—methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

BRIEF SUMMARY/**Indications:** Ambar suppresses appetite and helps offset emotional reactions to dieting. **Contraindications:** Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. **Precautions:** Administer with caution in the presence of cardiovascular disease or hypertension. **Side Effects:** Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. See package insert for further details.

Owner Breaks Arm When Yacht Runs Agroun

Schuyler, Oct. 31. Harry Waters of Covesville incurred a fractured arm ... large rock ... tially capsized. The fire depar... had to rescue Waters by smal... Damage to the yacht is estim...

Hasn't the skipper had enough excitement for one day?

For the patient who has been through an accident, the worry and anxiety following the mishap may actually heighten the perception of pain. This is why there's a classic ¼ grain *sedative* dose of phenobarbital in Phenaphen with Codeine—to take the nervous "edge" off, so the rest of the formula can control the pain more effectively.

A.H. Robins Company, Richmond, Va. 23220 A·H·ROBINS

Phenaphen® with Codeine

Phenaphen with Codeine Nos. 2, 3, or 4 contains: Phenobarbital (¼ gr.), 16.2 mg. (warning: may be habit forming); Aspirin (2½ gr.), 162.0 mg.; Phenacetin (3 gr.), 194.0 mg.; Hyoscyamine sulfate, 0.031 mg.; Codeine Phosphate, ¼ gr. (No. 2), ½ gr. (No. 3), or 1 gr. (No. 4) (warning: may be habit forming).

The compound analgesic that calms instead of caffeinates

Indications: Phenaphen with Codeine provides relief in severer grades of pain, on low codeine dosage, with minimal possibility of side effects. Its use frequently makes unnecessary the use of addicting narcotics. **Contraindications:** Hypersensitivity to any of the components. **Precautions:** As with all phenacetin-containing products excessive or prolonged use should be avoided. **Side effects:** Side effects are uncommon, although nausea, constipation and drowsiness may occur. **Dosage:** Phenaphen No. 2 and No. 3—1 or 2 capsules every 3 to 4 hours as needed; Phenaphen No. 4—1 capsule every 3 to 4 hours as needed. For further details see product literature.

MED-CHI TOUR

The Medical and Chirurgical Faculty is sponsoring another exciting tour in the near future:

ORIENTAL CARNIVAL—May 1 to May 17, 1970

A fabulous deluxe tour leaving from Friendship Airport. This is an all-inclusive tour with six fun-filled days and nights in Tokyo, seven glorious days and nights in Hong Kong, three enchanting days in Honolulu. An opportunity is provided to visit the fabulous 1970 Japan World Exposition in Osaka via the famous "Bullet" train (140 m.p.h.). Included are sightseeing tours, a get-together cocktail party, dinners in restaurants of your choice, breakfasts, and many other attractions.

Make your reservations NOW: For information and reservations contact Mrs. Beverly Wolins, Travel Guide Agency, 416 North Charles Street, Baltimore 21201 (301-727-0680) or Mrs. Genevieve Ritchie, the Faculty office, 1211 Cathedral Street, Baltimore 21201 (301-539-0872).

K. Merrill Sumey, Resident Manager

THE EXTINCT MEDICAL SCHOOLS OF BALTIMORE, MARYLAND, Harold J. Abrahams, with a foreword by George W. Corner; Maryland Historical Society, 1969.

Judging by the number of inquiries received by the Faculty in the course of a year, this book will fill a definite void for the many genealogists seeking data or information about their forefathers, individuals seeking information as to when and where a relative or friend graduated from medical school, and other interested parties who have been requesting such data from this book for some time.

The title of this book could well be "The Extinct Medical Schools of Maryland", for there were none elsewhere in the state. Strange names such as The Medico-Chirurgical, and Theological College of Christ's Institution appear in the book—a school which was chartered in 1910 but never came into existence. A second phantom school was the Maryland College of Eclectic Medicine and Surgery, organized in 1912, which bore three different names in as many years. These institutions were reminiscent of the diploma mills castigated in the now famous Flexner report.

This book is well written, although the photo offset process makes it somewhat difficult to read. It is complete, even to a listing of the teachers at these schools, as well as a listing of individuals who did and did not graduate from these courses. It provides a means for historical research and is a book that will add greatly to the value of medical and other libraries devoted to research and history.

CURRENT CONCEPTS IN OPHTHALMOLOGY, VOLUME II, Bernard Becker, MD, and Ronald M. Burde, MD; The C. V. Mosby Company, St. Louis, Mo. 1969.

The aim of this volume, the second having been prompted by the enthusiastic response to the first, is to bring the reader current thoughts and practices in this particular field of medicine.

Topics have been selected that need clarification in the light of present-day knowledge. It does this well, and those who found the first issue stimulating will, no doubt, find the second one more so.

FIRST AID

. . . . for your ailing "Accounts Receivable"

Is your financial statement suffering from the common ailment of too many delinquent accounts? Does the unpleasant chore of "dunning" past due accounts interfere with your office assistant's more important duties of making appointments, preparing patients, taking tests and recording data? Are you collecting unpaid bills instead of fees?

WE HAVE THE CURE

Refer your past due accounts to us for efficient, courteous collection. Solving collection problems is our business. While you concern yourself with the health of your patients, let us bring health to your Accounts Receivable.

THE MONTH IN WASHINGTON

The Internal Revenue Service postponed until January 1, 1971 one provision of a new requirement that health insurance companies report to the IRS payments of $600 or more a year to a physician.

The delayed provision covers payments for services not covered by medicare and medicaid. Payments of $600 or more under these government programs *must* be reported to the IRS. A spokesman said the reporting of payments was delayed for a year to allow further time for working out compliance procedures.

The IRS regulation applies only to direct payments to physicians. The Senate added an amendment to an omnibus tax bill that would have extended the requirement to indirect payments also. But House-Senate conferees took out the amendment.

Another provision unfavorable to physicians was knocked out of the tax bill, but a third was retained.

The Senate rejected a proposal that would have restricted the tax advantages gained by physicians who organize professional corporations under state laws to establish retirement plans. The Senate Finance Committee had added an amendment that would have set an annual limit of $2,500 per individual, the same as specified under the so-called Keogh law. But the Senate, by a vote of 65 to 25, knocked out the amendment, leaving physicians, lawyers, engineers and other members of professional corporations able to set aside as much of their income for retirement as they choose.

As finally passed by Congress, the measure includes a provision putting congressional approval on an IRS ruling that advertising revenue of medical and other nonprofit, tax-exempt organizations is subject to the regular corporate income tax. Journals of state medical societies, as well as the *Journal of the American Medical Association,* are affected.

* * *

Medicare's Part B premium partially covering physicians' fees will go up from $4 to $5.30 a month next July 1.

Health, Education and Welfare Secretary Robert H. Finch blamed his predecessor in the post, Wilbur J. Cohen, for the size of the 32% increase in the premium which is matched by the federal government.

Finch noted that the present $4 premium rate, set in December 1968, was too low to cover costs during the current premium period and that the special Medical Insurance Trust Fund has been drawing on its reserves. He said that failure to increase the premium rate last December, in accordance with advice from Social Security Administration actuaries had made it necessary now, in effect, to promulgate two increases at once. Moreover, the depletion of the trust fund that has occurred because of the inadequate rate has made it necessary, he said, to provide for a somewhat higher margin of contingency than would otherwise be necessary.

About half the increase, 64 cents, was needed to finance the program at the level of current operations. The other 66 cents of the $1.30 increase was distributed as follows:

- 26 cents to cover an estimated increase of about 6% in the level of physicians' fees;
- about 12 cents to cover an estimated increase of 2% in the utilization of services under the program;
- about 6 cents because the $50 deductible which a patient pays will be a smaller proportion of the total covered charges;
- the remaining 22 cents to provide a 4% margin for contingencies.

* * *

President Nixon signed into law legislation setting tough federal safety standards for coal mines.

Although he had reservations about a conflict with state workmen's compensation laws, Nixon said "the health and safety provisions of this act represent an historic advance in industrial practices." He also cautioned that this law should in no way "be considered a precedent for future federal administration of workmen's compensation programs."

The Secretary of HEW was given authority, for the first time, to set health standards for mines. Nixon said he had asked that wherever possible the disability standards under the new act be consistent with those of the Social Security disability program.

Pressure for the legislation started building up after 78 died in a Mannington, W. Va. mine disaster last November.

The AMA supported an overall Administration bill on occupational health and safety, and pledged the backing of the nation's physicians for any program "well designed to improve the safety and health of the American worker."

R. Lomax Wells, MD, Silver Spring, immediate past chairman

of the AMA's Council on Occupational Health, told a Senate labor subcommittee:

". . . the American Medical Association supports the new Administration bill, S. 2788. Its provisions for standard setting, not in the Labor Department but in a new National Occupational Safety and Health Board appointed by the President, with a majority of professional experts, seems to us an acceptable equivalent to our previous suggestion of a National Council on Hazardous Physical and Chemical Agents. We endorse its concept of a separation of powers between standard setting and enforcement. We welcome, in this new bill, the intent to give a larger role to the Department of Health, Education and Welfare, whose competence in this field is recognized. Our Association approves the provision for federal support of state occupational safety and health programs to supplement inadequate manpower in the federal system. We believe that this emphasis on support of the state programs, combined with standard setting by an independent professional board, is greatly preferable to mandatory national standards promulgated and enforced by a single federal agency. In this regard, we welcome the stress on the use of consensus standards, and provisions for consultation with professional standard-setting agencies before establishing needed new standards."

* * *

A National Heart and Lung Institute task force predicted that the demand for heart transplants will increase beyond the present level of about 100 a year and exceed the number of the organs available for the operation.

The report of the task force on cardiac replacement also said:

● Less than 16% of the 200,000 Americans under 65 who die each year from heart disease are good candidates for transplants. ● Rejection of the transplanted heart will remain "the greatest barrier to prolonged survival." ● Development of an artificial heart is now a distinct possibility. ● The federal government should emphasize research on the prevention, early detection and early treatment of heart disease. ● A new definition of death is needed. ● Total transplant charges for 36 patients averaged $18,694 per patient. ● Heart transplants have been performed on 148 patients, with 23 persons still surviving, 16 of them in the United States. ● More than 32,000 heart disease victims can be considered transplant candidates, but there are only about 22,000 possible donors a year, the report said.

* * *

The Food and Drug Administration was reorganized and given independent status under a new commissioner.

The reorganization followed several years of criticism of the Health, Education and Welfare Department agency from all sides —Congress, industry and consumers' groups. The criticism resulted in a two-month study by a task force headed by HEW Deputy Assistant Secretary for Welfare Fred Malek.

The reorganization focused on FDA's structural problems and the chief aim of HEW Secretary Robert H. Finch appeared to be to get the agency operating more efficiently. FDA was taken out of the Consumer Protection and Environmental Health Service and placed in the department's staff structure on an equal basis with the remaining Environmental Health Service and the National Institutes of Health.

Charles C. Edwards, MD, formerly a division director on the American Medical Association headquarters staff, was named to replace Herbert L. Ley, Jr., MD, as head of the FDA. Ley was offered another post in HEW but declined it. Two of Ley's top aides, FDA Deputy Commissioner Winton B. Rankin and Associate Commissioner for Compliance J. Kenneth Kirk, were transferred from the agency.

Edwards was praised by a former associate on the AMA staff, C. Joseph Stetler, president of the Pharmaceutical Association, as being highly qualified by his scientific and administrative background.

The new FDA head said he would bring "hard-nosed management principles" to the agency and work more closely with industry, but that his administration of FDA would be oriented to the consumer. He said his decisions as a government official will not be influenced by his former association with the AMA.

"AMA Registry on Adverse Reactions" Needs Information from Hospitals

The editors of the *AMA Registry on Adverse Reactions Due to Occupational Exposures* need the assistance of hospital medical staffs in collecting information on adverse effects resulting from new chemicals, biological or physical agents, or from exposure to old materials used in new processes. The *Registry* hopes to delineate newly recognized occupational disease manifestations.

Physicians are urged to submit reports of single observations, from which the aggregate compilation may establish the probability of a causal relationship between a special exposure and an adverse effect.

Report forms are available from the AMA Department of Occupational Health, 535 North Dearborn Street, Chicago, Ill. 60610.

Venereal Disease Treatment Schedule

Maryland State Department of Health
Division of Communicable Diseases
Venereal Disease Control Section
11/3/69

Diagnosis	Treatment	Comments and Follow-Up
1. Primary Syphilis 2. Secondary Syphilis	2,400,000 units of Benzathine Penicillin G (Bicillin) IM at a single session (1,200,000 units in each buttock)	STS in 30 days then every 3 months for a year.
3. Late Syphilis		
A. *Early Latent Syphilis* (Less than 2 year's duration)		
1. Nonreactive Spinal Fluid Examination	2,400,000 units Bicillin IM at a single session (1,200,000 units in each buttock)	STS every 3 months for 1 year; then every 6 months for a year—for a total of 2 years.
2. No Spinal Fluid Examination Done	7,200,000 units Bicillin IM total (2,400,000 units weekly × 3)	Same as above
B. *Late Latent Syphilis* (more than 2 year's duration)		
1. Nonreactive Spinal Fluid Examination	2,400,000 units Bicillin IM at a single session (1,200,000 units in each buttock)	STS every 3 months for 1 year; then every 6 months for a year—for a total of 2 years.
2. No Spinal Fluid Examination Done	7,200,000 units Bicillin IM total (2,400,000 units weekly × 3)	Same as above
C. Late Manifest Syphilis Cardiovascular Neurosyphilis Other	7,200,000 units Bicillin IM total (2,400,000 units weekly × 3)	STS every 3 months for 1 year; then every 6 months for a year—for a total of 2 years. In neurosyphilis, the spinal fluid should be re-examined 6 months after treatment.
4. Congenital		
A. Early (Patient under 2 years old)	50,000 units Bicillin per kg. body weight in a single dose.	STS every 3 months for 1 year
B. Late (Patient over 2 years old)		
1. under 12 years; weight 70 lbs. or less	1,200,000 units Bicillin IM in a single injection	STS every 3 months for 1 year; then every 6 months for a year
2. 12 years or older but weight more than 70 lbs.	same as stage of late syphilis	same as stage of late syphilis
5. Syphilis in Pregnancy	According to Stage	According to Stage
6. Prophylactic Treatment for Syphilis	2,400,000 units of Bicillin IM at a single session	STS monthly for 3 months
7. Gonorrhea in Males	2,400,000 units of Aqueous Procaine Penicillin IM at a single session	STS at time of treatment. Repeat in 4 months if non-reactive. Culture at time of treatment and 4 to 7 days after treatment.
8. Gonorrhea in Females	4,800,000 units of Aqueous Procaine Penicillin IM at a single session (2,400,000 units in each buttock)	STS at time of treatment. Repeat in 4 months if non-reactive. Culture at time of treatment and 4 to 7 days after treatment.
9. Prophylactic Treatment for Gonorrhea	same as above for each sex	same as above for each sex
Alternate Antibiotics (for those sensitive to Penicillin)		
Gonorrhea	Tetracycline or Erythromycin 1.5 gm orally; then 0.5 gm orally 4 times a day for 4 days (9.5 gm) (Same for prophylactic treatment of contacts)	
Syphilis		
1. A. Primary and Secondary B. Latent cases with nonreactive spinal fluid examination	Tetracycline *or* Erythromycin 0.5 gm orally 4 times a day for 15 days (30 gm) (Same for prophylactic treatment of contacts)	
2. A. Late Manifest B. Latent cases with no spinal fluid examination done	Tetracycline *or* Erythromycin 0.5 gm orally 4 times a day for 30 days (60 gm)	
Note: Erythromycin is the preferred alternate antibiotic for pregnant patients.		
10. Chancroid	Sulfonamides such as Sulfadiazine 1.0 gm qid for 7 days or Tetracycline 0.5 gm orally qid for 14 days	STS at time of treatment, then monthly for 3 months
11. Granuloma Inguinale	Tetracycline orally 0.5 gm qid for 15 days	STS at time of treatment. Repeat in 4 months if nonreactive.
12. Lymphogranuloma Venereum	Tetracycline orally 0.5 gm qid for 10 days	STS at time of treatment. Repeat in 4 months if nonreactive.

ANNUAL MEETING PROGRAM

Wednesday, April 1, 1970

The Alcazar, Baltimore

9:30 AM—Meeting of the House of Delegates

2:00-4:30 PM—Scientific Session

Doctor-Patient Relationship and Management of the Neurotic Patient
Roy W. Menninger, MD, President, The Menninger Foundation, Topeka, Kansas

The Future of Medical Education: Undergraduate and Postgraduate
George James, MD, Dean, Mount Sinai School of Medicine, New York

The Emerging Physician's Assistant
Hu C. Myers, MD, Medical Director, Chief of Surgery, Director of Cancer Clinic, Broaddus Hospital, Philippi, West Virginia

The Belvedere Hotel, Baltimore

5:30-7:00 PM—Hospitality Night for all members of the Faculty and their wives

7:00 PM—International Dinner and Entertainment sponsored by the Woman's Auxiliary

Thursday, April 2, 1970

The Alcazar, Baltimore

9:30 AM-Noon—Scientific Session

Medical Grand Rounds
A. McGehee Harvey, MD, and Medical Staff of The Johns Hopkins University School of Medicine

Diagnostic Limitations of Body Fluid Enzyme Alterations: A Reappraisal
Felix Wroblewski, MD, Associate Professor of Clinical Medicine, Cornell University Medical College, New York

Noon—Election of Board of Medical Examiners

The Belvedere Hotel, Baltimore

12:30 PM—Annual Round Table Luncheon, which will include meetings of the alumni associations of several medical schools, as well as the usual scientific subjects

The Alcazar, Baltimore

2:15-4:45 PM—Scientific Session

Surgical Grand Rounds
Robert W. Buxton, MD, and Surgical Staff of the University of Maryland School of Medicine

Venous Bypass Grafting for Coronary Artery Disease
Frank C. Spencer, MD, Professor and Chairman, Department of Surgery, New York University Medical Center

The Blue Crest North, Baltimore

6:15 PM—Annual Presidential Reception and Banquet in a delightful atmosphere with delectable cuisine, hors d'oeuvres, cocktails and dancing for all to the music of Rivers Chambers' Orchestra

MEDICAL AND CHIRURGICAL FACULTY OF MARYLAND

Friday, April 3, 1970

The Alcazar, Baltimore

9:15 AM-12:30 PM—Scientific Session

The Eye in Systemic Disease
Daniel M. Gordon, MD, Associate Professor of Ophthalmology, Cornell University Medical College, New York

The Harmful Use of Sex
John Rock, MD, Clinical Professor Emeritus of Gynecology, Harvard Medical School

Pulmonary Embolism: Its Causes and Prevention
William H. Moretz, MD, Chairman, Department of Surgery, Medical College of Georgia

Physical Examination of the Joints: A Challenge
William P. Beetham, Jr., MD, Lahey Clinic Foundation, Boston

Osler Hall, Faculty Building, Baltimore

2:00 PM—Meeting of the House of Delegates

* * * * * * *

HEALTH EVALUATION TESTS—The Alcazar

This ever popular benefit of membership in the Medical Faculty will again be available for physicians at the Alcazar during the Annual Meeting

* * * * * * *

ARTS AND HOBBY EXHIBIT—The Alcazar

An opportunity is offered for physicians, their wives, and families to put their artistic talents on display *(see page 66 for the application form).*

* * * * * * *

SCIENTIFIC AND TECHNICAL EXHIBITS AT THE ALCAZAR

Wednesday, Thursday, and Friday
Intermissions will be provided to visit these exhibits
which constitute a symposium on therapeutic progress.

(See page 40 for a list of Technical Exhibitors to date)

PLAN TO ATTEND
MARK THESE DATES ON YOUR CALENDAR

APRIL 1, 2, 3, 1970

172nd ANNUAL MEETING

Prominent speakers* who will present papers during the Annual Meeting in April include **John Rock, MD, Hu C. Myers, MD, and Frank C. Spencer, MD.**

The Harmful Use of Sex will be the title of the Hundley Memorial Lecture in Gynecology to be given by **John Rock, MD,** on Friday, April 3, at the Alcazar. Dr. Rock, Clinical Professor of Gynecology, Emeritus, Harvard Medical School, was graduated from Harvard College and received his MD degree from Harvard Medical School. In the 1920's he began the practice of obstetrics and gynecology in Boston and started a Fertility Clinic at the Free Hospital for Women in Brookline, Massachusetts. From the beginning, his professional activities have been concerned mainly with the needs of couples who are involuntarily childless, and his research has concentrated on the first stages of conception, the development of the human embryo, and the clinical disorders of human reproductive physiology.

Dr. Rock

Dr. Rock served as Clinical Professor of Gynecology at Harvard from 1947 until his retirement in 1956. In 1956 he established the Rock Reproductive Clinic, Inc., in Brookline. He is the recipient of the Lasker Award of the Planned Parenthood Federation of America, the Ortho Award of the American Gynecological Society, and the Ortho Award of the American Society for the Study of Sterility. He holds honorary degrees from the University of San Marcos in Lima, Peru, the University of Chile in Santiago, Chile, Amherst College, and Harvard University.

Dr. Rock is co-author of *Voluntary Parenthood.* His most recent book, *The Time Has Come, A Catholic Doctor's Proposals to End the Battle Over Birth Control,* was published in 1963 and has been translated into four foreign languages.

The annual I. Ridgeway Trimble Fund Lecture will be given by **Frank C. Spencer, MD,** Professor and Chairman, Department of Surgery, School of Medicine, New York University. The subject Dr. Spencer will discuss is *Venous Bypass Grafting for Coronary Artery Disease.* Dr. Spencer was graduated Magna Cum Laude from the North Texas State University and received his MD degree from Vanderbilt University School of Medicine in 1947 receiving at that time the Founder's Medal Scholarship Award. After serving an internship and fellowship in surgery at The Johns Hopkins Hospital, he went to Wadsworth Hospital in Los Angeles as an assistant resident surgeon. Following this he was a fellow in cardiovascular surgery at the U. S. Public Health Service, UCLA School of Medicine. From 1951 to 1953, Dr. Spencer was in the Medical Corps of the U.S. Navy.

Dr. Spencer

In 1954, Dr. Spencer came back to Hopkins as an instructor in surgery, where he continued as resident surgeon, assistant professor of surgery, associate professor of surgery, and surgeon-in-charge of the Emergency Department, until 1961. From 1957 to 1965 he served as a consultant in surgery at the Walter Reed Army Hospital, the National Heart Institute, and the Veterans Administration Hospital (Lexington, Kentucky). Dr. Spencer was professor of surgery at the University of Kentucky School of Medicine from 1961 to 1965. In January 1966 he became affiliated with the Department of Surgery, School of Medicine, New York University, as professor and chairman. He is also director of New York University, Surgical Divisions, Bellevue Hospital; and director of surgery at

* See the January Journal for capsule biographies of **Roy W. Menninger, MD, George James, MD, Daniel M. Gordon, MD** and **William H. Moretz, MD.**

SPEAKERS – APRIL 1, 2, 3

University Hospital in New York City.

Dr. Spencer is a member of fifteen medical associations, including the American College of Surgeons, Society of Clinical Surgeons, and Society for Vascular Surgery. He is certified by the American Board of Surgery and the Board of Thoracic Surgery. The many honors bestowed upon him include the Alpha Omega Alpha at Vanderbilt; the Legion of Merit Award, U.S. Navy; Annual Research Award, University of Kentucky Alumni Association; and the Faculty Achievement Award, Kentucky State Medical Association.

Hu C. Myers, MD, will give the Harvey Grant Beck Memorial Lecture on *The Emerging Physician's Assistant*. This has been scheduled for Wednesday afternoon, April 1, at the Alcazar. Dr. Myers was a member of the Advisory Council on the Physician's Assistant Program of Alderson-Broaddus College, which recently established a course with a Bachelor of Science degree for the Physician's Assistant. The purpose of the curriculum is to create learning experiences designed to prepare selected students to perform for patients physician-directed, supervised, and identified personal medical services at levels of competence acceptable to the medical profession. The supervising physicians, through the Assistant, may be freed to devote their personal efforts to the more critical and demanding problems which face their patients.

Dr. Myers

Chief of Surgery at Broaddus Hospital in Philippi, West Virginia, Dr. Myers is also Professor of Medical Science and Director of the Physician's Assistant Program at Alderson-Broaddus College. Dr. Myers received his MD degree from Emory University and served an internship at the Steiner Cancer Clinic of Grady Hospital, and a residency at the Georgia Baptist Hospital. He is a Diplomate of the American Board of Surgery, and a fellow of both the American College of Surgeons and the Southeastern Surgical Congress. Dr. Myers is a past president of the Tygart's Valley Medical Society, West Virginia Division of the American Cancer Society, and the West Virginia Hospital Association. He is currently president of the West Virginia State Board of Health, and president of the Board of the Cancer Clinic at Broaddus Hospital.

Dr. Myers is the recipient of the following awards: Gold Medal, Southeastern Surgical Congress; Citizen Award, West Virginia Public Health Association; ScD (honorary) degree, Alderson-Broaddus College; Medical Records Award, American College of Surgeons; and Distinguished Service Award, American Cancer Society. He is the author of forty published papers on a variety of surgical subjects and has developed scientific exhibits on cancer, cyanoacrylates in surgery, new surgical instruments, and various research projects.

CENSUS DAY IS APRIL 1

ADVERTISING COUNCIL®

advertising contributed for the public good

DEPARTMENT OF COMMERCE · UNITED STATES OF AMERICA

PROTEIN CONTENT / 7 oz. Serving*

Bean with Bacon	6.8	Green Pea with Ham (Frozen)	7.6
Beef	8.0	Hot Dog Bean	8.4
Chicken Broth	5.5	Pepper Pot	6.1
Chicken 'N Dumplings	5.8	Split Pea with Ham	10.2
Chili Beef	6.2	Vegetable Beef	5.0
Green Pea	6.9	Vegetable with Beef (Frozen)	5.4

When protein is the focal point in your patients' special diets, Campbell's Soups can be a convenient supplementary source of that essential nutrient.

* From "Nutritive Composition of Campbell's Products" which gives values of important nutritive constituents of all Campbell's Products. For your copy, write to Campbell Soup Company, Dept. 365, Camden, New Jersey 08101.

There's a soup for almost every patient and diet ...for every meal and, it's made by Campbell

LOMOTIL®

TABLETS/LIQUID

Each Lomotil tablet and each 5 cc. of Lomotil liquid contain:
diphenoxylate hydrochloride .....2.5 mg.
(Warning: May be habit forming)
atropine sulfate .....0.025 mg.

One hundred per cent of all travelers who have traveled 200,000 miles or more away from home have relied on Lomotil to control diarrhea.

When your patients need a reliable antidiarrheal—at home or away from home—rely on Lomotil.

In diarrheas associated with:

- gastroenteritis
- acute infections
- functional hypermotility
- irritable bowel
- ileostomy
- drug-induced diarrhea

Warnings: Lomotil should be used with caution in patients taking barbiturates and, if not contraindicated, in patients with cirrhosis, advanced liver disease or impaired liver function.

Precautions: Lomotil is a federally exempt narcotic with theoretically possible addictive potential at high dosage; this is not ordinarily a clinical problem. Use Lomotil with considerable caution in patients receiving addicting drugs. Recommended dosages should not be exceeded, and medication should be kept out of reach of children. Signs of accidental overdosage may include severe respiratory depression, flushing, lethargy or coma, hypotonic reflexes, nystagmus, pinpoint pupils, tachycardia; continuous observation is necessary. The subtherapeutic amount of atropine sulfate is added to discourage deliberate overdosage.

Adverse Reactions: Side effects reported with Lomotil therapy include nausea, sedation, dizziness, vomiting, pruritus, restlessness, abdominal discomfort, headache, angioneurotic edema, giant urticaria, lethargy, anorexia, numbness of the extremities, atropine effects, swelling of the gums, euphoria, depression and malaise. Respiratory depression and coma may occur with overdosage.

Dosage: The recommended initial daily dosages, given in divided doses until diarrhea is controlled, are as follows:

Children:

3-6 mo.	½ tsp.* t.i.d. (3 mg.)
6-12 mo.	½ tsp. q.i.d. (4 mg.)
1-2 yr.	½ tsp. 5 times daily (5 mg.)
2-5 yr.	1 tsp. t.i.d. (6 mg.)
5-8 yr.	1 tsp. q.i.d. (8 mg.)
8-12 yr.	1 tsp. 5 times daily (10 mg.)
Adults:	2 tsp. 5 times daily (20 mg.) or 2 tablets q.i.d.

*Based on 4 cc. per teaspoonful

Maintenance dosage may be as low as one-fourth the initial daily dosage.

G. D. SEARLE & CO.
P. O. Box 5110, Chicago, Illinois 60680
Research in the Service of Medicine 952

Nose clear as a whistle

(THANKS TO DIMETAPP®)

Dimetapp Extentabs® does an outstanding job of helping to clear up the stuffiness, drip and congestion of colds and upper respiratory allergies and infections. Each Extentab keeps working up to 12 hours. And for most patients drowsiness or overstimulation is unlikely. Try Dimetapp. It clearly works.

FOR UPPER RESPIRATORY ALLERGIES AND INFECTIONS

Dimetapp Extentabs®

Dimetane® (brompheniramine maleate), 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.

UP TO 12 HOURS CLEAR BREATHING ON ONE TABLET

Indications: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, sinusitis, rhinitis, conjunctivitis, and otitis.
Contraindications: Hypersensitivity to antihistamines. Not recommended for use during pregnancy.
Precautions: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.
Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered.
Dosage: 1 Extentab morning and evening.
Supplied: Bottles of 100 and 500.

A.H. ROBINS COMPANY
RICHMOND, VA. 23220

A·H·ROBINS

The girth control pill

Tepanil® Ten-tab®

(continuous release form)

(diethylpropion hydrochloride)

works on the appetite not on the 'nerves'

When girth gets out of control, TEPANIL can provide sound support for the weight control program you recommend. TEPANIL reduces the appetite—patients enjoy food but eat less. Weight loss is significant—gradual—yet there is a relatively low incidence of CNS stimulation.

Contraindications: Concurrently with MAO inhibitors, in patients hypersensitive to this drug; in emotionally unstable patients susceptible to drug abuse.

Warning: Although generally safer than the amphetamines, use with great caution in patients with severe hypertension or severe cardiovascular disease. Do not use during first trimester of pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of therapy, unpleasant symptoms with diethylpropion hydrochloride have been reported to occur in relatively low incidence. As is characteristic of sympathomimetic agents, it may occasionally cause CNS effects such as insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has been reported. In a few epileptics an increase in convulsive episodes has been reported. Sympathomimetic cardiovascular effects reported include ones such as tachycardia, precordial pain, arrhythmia, palpitation, and increased blood pressure. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride; this was an isolated experience, which has not been reported by others. Allergic phenomena reported include such conditions as rash, urticaria, ecchymosis, and erythema. Gastrointestinal effects such as diarrhea, constipation, nausea, vomiting, and abdominal discomfort have been reported. Specific reports on the hematopoietic system include two each of bone marrow depression, agranulocytosis, and leukopenia. A variety of miscellaneous adverse reactions have been reported by physicians. These include complaints such as dry mouth, headache, dyspnea, menstrual upset, hair loss, muscle pain, decreased libido, dysuria, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallowed whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times daily, one hour before meals. If desired, an additional tablet may be given in midevening to overcome night hunger. Use in children under 12 years of age is not recommended.

THE NATIONAL DRUG COMPANY
DIVISION OF RICHARDSON-MERRELL INC
PHILADELPHIA, PENNSYLVANIA 19144

Joint Anesthesia Study Committee—

Calbert T. Seebert, MD, Chairman
Joint Anesthesia Study Committee

"On April 26, 1953, the president of the Baltimore City Medical Society, after conferring with the Commissioner of Health of the City of Baltimore, appointed a committee for the purpose of studying the causes of death and sequelae during and following surgical and obstetrical procedures in the City of Baltimore." [1] This Committee is now known as the Joint Anesthesia Study Committee of the Baltimore City Medical Society and the Baltimore City Health Department. Otto C. Phillips, MD, was the first Chairman of the Committee. Mr. Todd M. Frazier, formerly Director of the Bureau of Biostatistics in the Baltimore City Health Department, was also instrumental in the organization of the committee.

"The objective of this committee, as adopted at its first meeting held on May 25, 1953, is to discuss every death in this city that occurs the day of, or the day after the operation, for the purpose of uncovering repetitive errors and for the dissemination of information on errors, with no attempt by the committee, in any case, to identify any individual or hospital." [1] With the present-day revision of the definition of death by Denton Cooley, MD, the Committee has also decided to review all cases in which there is major brain damage within 48 hours of the induction of anesthesia.

Collection of Cases

The first step in the collection of cases for the Joint Anesthesia Study Committee is made by the Baltimore City Health Department, which obtains the necessary information from the death certificate. An identification number is assigned to each death certificate, and these are then kept in a separate file at the Health Department. An explanatory letter is forwarded to the Department of Anesthesiology of the hospital concerned, along with an outline for a case study and an envelope addressed to the Committee Chairman in care of the Medical Society.

Upon receipt of the completed case protocol by the chairman, the only identifying information on the form is the case number assigned. The case protocols, when returned, are then reviewed by the chairman or by a Screening Committee composed of the other members of the Joint Anesthesia Study Committee. All cases are disposed of in which there is unanimous agreement by the committee members that anesthesia had no plausible role in the eventual outcome. In cases in which the anesthetic management contributed to the patient's death, the error in the phase of anesthetic management is further described. All of the collected information is then tabulated on a code sheet by the chairman.

The code sheets are then sent to the Bureau of Biostatistics of the Baltimore City Health Department. Some of the items which are coded include information on the patient's age, sex, race, preoperative condition, preoperative and postoperative diagnosis, operation proposed and performed, primary anesthetic agent and technique, relaxants, technique for maintaining the airway, postoperative condition, and the vote of the Anesthesia Study Committee. Miss Elizabeth Kelly, present Director of the Bureau of Biostatistics in the Baltimore City Health Department, is in charge of transferring the information to punch cards and the tabulations required for the statistical analysis of the case material.

Organization and Function

Open Committee Meetings

Seven or eight discussion meetings are held at the auditorium of the Medical and Chirurgical Faculty during the academic year. The meetings are always on the fourth Tuesday of the month at 7:30 PM. Notices of the meeting are mailed to the anesthesia departments of all hospitals in the State of Maryland, with the exception of those in the District of Columbia suburbs. All physicians and nurse anesthetists are invited to attend. Two interesting teaching cases are presented at each meeting. Case protocols are summarized in advance of the meeting and forwarded to the speakers and other interested physicians in the state. Additional copies are distributed to the audience at the time of the meeting. Leaders in the fields of anesthesiology, medicine, and surgery from the city present the case reports and lead the discussion which follows. The meeting is informal and the audience enters freely into the discussion and the question and answer period at the end of each case presentation.

Because of the declining attendance at the open committee meetings during the past academic year, the chairman decided to invite outstanding out-of-town physicians to participate in several of the meetings. On September 24, 1969, Robert D. Dripps, MD, Professor and Chairman of the Department of Anesthesiology at the University of Pennsylvania, spoke on "The Anesthetic Management of the Pulmonary Cripple" and presented two illustrative cases from the files of the committee. On November 25, 1969, John Adriani, MD, Director of Anesthesiology at Charity Hospital in New Orleans, Professor of Surgery (Anesthesiology) at Tulane University School of Medicine and Clinical Professor of Pharmacology and Surgery at the Louisiana State University School of Medicine, spoke on the subject of "Neuroleptanalgesia" and presented illustrative cases from our files. Jay Jacoby, MD, Professor and Chairman of the Department of Anesthesiology at Jefferson Medical College will speak to the organization on April 28, 1970.

The chairman feels that bringing nationally prominent anesthesiologists to Baltimore will create added interest in the work of the committee and provide more interesting and fruitful meetings.

During the academic year 1968-1969, 348 requests for case studies were sent from the Bureau of Biostatistics to 17 hospitals in Baltimore city. Adequate case reports were returned in 187 instances. The anesthetic management was found to have contributed to the death of the patient in 12 cases. In three cases, errors in anesthetic management were the primary cause of death. In nine cases, errors in anesthetic management were one of several contributing factors in the patients' deaths.

The failure of the anesthesiologists in the city to return more of the requested case reports has limited the function of the committee as a retriever of medical information. However, the monthly open committee meetings, particularly with out-of-town guest speakers, continue to serve as an excellent teaching tool in the continuing education of the practicing anesthesiologist.

1. Phillips, Otto C. and Frazier, Todd M.: The Baltimore Anesthesia Study Committee Organization and Preliminary Report, *Anesthesiology* **18**:33 (January-February), 1957.

The anesthesiologist as a physician has existed for almost 125 years, but it is only within the last few decades that anesthesia has become recognized as a specialty and its beneficial effects appreciated. The primary change has been in the area of the patient's safety. Knowledge of physiology and pharmacology was joined to the technique and administration of anesthetics, and both have matured into a philosophy of the management of patients under anesthesia.

ANESTHESIA — 1970

MARTIN I. GOLD, MD
President
Maryland-D.C. Society of Anesthesiologists
Professor
Department of Anesthesiology
University of Maryland School of Medicine

The anesthesiologist no longer practices a technical discipline but cares for his patient in three general stages:

1. **The Preoperative State** The primary functions of the anesthesiologist here are to assess the patient's medical and surgical problems, to request consultation, and to call for further laboratory tests in relation to his proposed anesthetic. The anesthesiologist may advise the surgeon to delay elective surgery until the patient's physical condition is improved.

2. **The Anesthetized State** At the present time, the anesthesiologist produces anesthesia which is considered adequate or inadequate based on a clinical evaluation of the patient's condition and needs. For years, complicated signs corresponding to stages and planes of anesthesia were used to follow a patient's course. In many instances, the blood oxygen tension decreased and the carbon dioxide tension increased. A revolution occurred with the advent of muscular relaxation, the need for artificial ventilation, and the realization that a patient's tidal volume should be augmented during anesthesia. Therefore, in addition to preserving normal blood gases, the anesthetist removes consciousness and memory, produces analgesia, raises or lowers blood pressure, decreases neuromuscular activity, and affects acid-base balance, metabolism, and blood volume.

3. **The Immediate Postoperative State** This has been and remains a difficult and trying period for surgical patients. A major advance occurred when the first postanesthetic recovery room was opened. This became the first hospital intensive care area. With the development of more skillful and specialized surgery, ancillary nursing help, improved equipment, and the availability of blood, the physician-anesthetist has allowed the surgeon to become far more daring. Many poor-risk patients survive surgery only to succumb immediately postoperatively, with the primary cause of death termed "respiratory." To a degree, the surgical anesthetic team is guilty of creating a "Frankenstein monster" which would never have lived through anesthesia and surgery a decade or two ago. Instead, operations are "successful" but the patient dies in the immediate postoperative period.

As a specialty, anesthesia has finally been accepted by the medical profession, lay people, the church (years ago, anesthesia was forbidden), deans of medical schools who seek advice from professors of anesthesia (three anesthesiologists are currently deans of medical schools), hospital directors and administrators, and insurance companies (which impose an increasingly more expensive malpractice rate for coverage of anesthesiologists).

One of the primary reasons for surgical success involves a duality of responsibility [1]; the surgeon skillfully repairs and resects, while the anesthesiologist, concerning himself with the administration of reversibly-acting poisons, maintains "normal" cardiovascular and respiratory physiology. The primary goal of both the surgeon and the anesthesiologist is to see that the patient leaves the hospital with a resected or repaired lesion. The primary purpose of the anesthesiologist is to see that life processes, especially the central nervous system, remain basically unchanged.

Shortage of Qualified Anesthesiologists

However, there is an acute shortage of trained, medical anesthesiologists.[2] Graduates of American medical schools have not filled American anesthesia residencies. Foreign graduates have certainly helped fill the vacancies, but a serious shortage still exists. Nurses and inadequately trained physicians have admirably filled in and performed excellently, but until an adequate number of Board-qualified and -certified anesthesiologists are available, and until all obstetrical and even dental anesthesia is performed by qualified anesthesiologists, serious shortage will exist.

Currently, only 59% of anesthesiologists are Board-certified; 14 other specialties have a higher incidence of Board certification while only four have a lower incidence.[3] Anesthesiologists administer approximately 40% of all anesthesia in the United States; nurses with training in anesthesia administer an additional 40%; 20% is evidently administered by general practitioners, dentists, and other personnel with a somewhat inadequate background.[4]

To compound this shortage, an increasing number of duties are performed by anesthesiologists, some of whom actively seek escape from the operating room routine to form a more lasting physician-patient relationship. Some anesthesiologists direct pain block clinics; others join organ transplant and cardiovascular bypass teams; some become heads of inhalation therapy departments; while others supervise and function in acute pulmonary care units. These activities may assume a major portion, if not the entire portion of the physician's medical practice. Therefore, the number of physicians practicing anesthesia may actually decrease.

Since much anesthesia is routine, and because this shortage of physician-anesthesiologists exists, it has been suggested that nurses or "anesthesia technicians" provide the "simple anesthesia" for "simple surgery." While this plan has been partially successful in the past, has practical aspects at present, and certainly merits consideration, the specialty is concerned that such a double-standard may be self-deprecating.[2] To have someone other than a physician-anesthesiologist administer anesthesia, which is the practice of medicine, has no analogy in other specialties, with the possible exception of midwifery in obstetrics. If personnel must continue to be drawn from the allied medical specialties to administer anesthesia, will the

specialty become less aggressive and overly compliant by working hand-in-hand with the nurse-technician?

On the other hand, the nurse anesthetist has done an admirable job, often under extreme duress since the "umbrella" of being a physician is absent in a frequently stormy operating room. There is no doubt that these individuals are skilled, professional, and responsible nurses. In addition, nurse anesthetists have not always received adequate recognition for their professional abilities. It is also a fact that at this time in the U.S. anesthesiologists cannot replace nurse anesthetists, nor will they in the near future.

Presently, only about 15% of obstetrical anesthesia in the United States is given by anesthesiologists. Therefore, 85% of these patients are receiving less than the best we have to offer. In Canada, a Board-certified anesthesiologist is present at approximately 60% of all deliveries.[5] According to a recently conducted survey, when the anesthesia was administered by an anesthesiologist, those babies delivered were in better condition.[6]

General anesthesia is given to many patients each day in the dentist's office under adverse conditions. These patients are operated upon within the site of the airway, frequently by professional and competent individuals extremely skillful in surgical technique but with relatively inadequate training in the administration of anesthesia and the preservation of the airway. The "operator-anesthetist" is to be condemned.[7] It is believed that these patients may be subjected to unknown periods of hypoxemia and hypercarbia. Frequently these patients have received inadequate premedication or none at all, and many have no preanesthetic physical examination or history. Fortunately, many dental surgeons have had excellent training in physical diagnosis and examination, and are able to refer the ill patients to hospitals for adequate diagnostic or therapeutic measures or both. In addition, sitting patients are in an unfavorable circulatory position. The oral surgeon may not be trained in resuscitation techniques or in making a diagnosis should a catastrophe occur. It is doubtful, for instance, that every office in which general anesthesia is administered has an electrocardiograph and a defibrillator.

The Time Factor

Utilization of the anesthesiologist's time through proper scheduling has been, is, and will become an even greater problem in the near future. With anesthesiologists in extremely short supply, it is interesting that in Great Britain, where anaesthetists comprise 3.9% of the medical population, all surgical anesthesia is administered by physicians. In the United States, anesthesiologists comprise 3.6% of the medical population,[5] but they administer only 50% of the anesthesia for surgical cases. Many factors influence this inequality, such as the difference in philosophy of speed by the surgical team.

One area requiring thought by both surgeons and anesthesiologists is the utilization of operating room time through proper scheduling of cases. Surveys reported recently in the Bulletin of the New York State Society of Anesthesiologists and in the Bulletin of the California Society of Anesthesiologists [5] indicate that improper scheduling may be a national problem. Accurate records should be kept of the utilization of each operating room. An empty room represents a gross waste of skilled operating room nurses, anesthesiologists, and other personnel. The amount of time existing between induction of anesthesia and surgical incision is another cause for concern and should be minimized. Anesthesiologists may be partly responsible since they should define the scheduled time as either induction or incision time and remain consistent.

With rising costs in hospital care, it is imperative that expensive, highly technical areas such as surgical suites and its personnel be utilized to the fullest extent. With better organization and utilization of time, the specialty might be able to fulfill its obligation in the areas of obstetrical anesthesia and elsewhere. The use of anesthesiologists for outpatient surgery at times when the anesthesiologist would not be scheduled in operating room suites is provocative but would require integration of inpatient and outpatient facilities at a major level.[8]

Current Problems in Anesthesia

1. **Journals** There are six anesthesia journals: two American, two British, one Canadian, and one Scandinavian, exclusive of special periodicals such as *Survey of Anesthesiology*. The type of research paper currently being published is somewhat more complicated and more accurate than was available a generation ago. The clinician must interpret this information and utilize it in his practice. He is frequently disappointed. There is little doubt that *Anesthesiology* is one of the most erudite and fundamental journals in the United States today but, in achieving its scientific excellence, it sometimes evades the practitioner, who on occasion avoids *Anesthesiology*.

A solution may lie in the development of a third American journal of anesthesiology with a different approach. Its editors and "voices" might perhaps include private practitioners of anesthesia in addition to the academicians. Research papers submitted for publication would include brief introductions, short discussions and pertinent conclusions. Any detailed methods, results, and discussions would be available to interested readers. The possible significance of any research work would be discussed by an editor willing to "stick his neck out". Another medium

would be an anesthesia newsletter-periodical appearing once or twice a month. Employment of an experienced group of reporters guided by mature editors would lead to the creation of readable material.

2. **Meetings** The practice of having investigators report for ten or fifteen minutes, followed by a five minute discussion at various anesthesia meetings, such as the annual ASA meeting, should be stopped. These talks may be boring and are frequently unintelligibly presented by a nervous research Fellow and scheduled automatically, one following the other. It is difficult to believe that an initially interested audience grasps details and results of an investigation, usually impeccably performed, when half of the talk is devoted to analytical technique and protocol presentation. When a year or more of work is compressed into ten minutes, it is virtually hopeless to interest an audience already tired of viewing poorly prepared slides, sometimes projected upside down.

The format of such meetings might be changed to include investigators providing three one-hour audiences at announced times. Prepared handouts would be discussed before small groups of interested clinicians and fellow researchers, pertinent questions could be asked, and a gap in communications would be bridged. Thus, the major portion of such a meeting could be devoted to business, symposia, and exhibits.

3. **Flammable Anesthetics** Should ether and cyclopropane be banned from hospital practice? Some intelligent and influential professors and chairmen of departments of anesthesia believe they have no place in modern anesthesia practice. It costs approximately $2,000 extra to prepare an operating room for the safe use of explosive agents. The saving of $20,000 for an eight- to ten-room operating suite is attractive. The restriction of monitors, electrocautery, and mobility of personnel argues against their use when many nonexplosive safe agents are available.

On the other hand, statistics show that the incidence of an explosion is very low—about one per 100,000 flammable anesthetics. With proper precautions by all personnel, the chance for an explosion to occur is extremely low. If a very ill patient requires either cyclopropane to maintain blood pressure, or diethyl ether to manage cardiac arrhythmias, the use of these agents should not be denied. At the 1968 New York State Society of Anesthesiologists meeting, a poll of approximately 2,000 anesthesiologists was made and the vote was overwhelmingly against banning these agents.[9]

4. **The Halothane Dilemma** Halothane has been proven a safe and reliable anesthetic. It is nonexplosive, easily vaporized, and conveniently administered. Its actions are generally predictable as are its hypotensive and bradycardic side effects. Recovery from halothane is rapid and reasonably pleasant, with minimal central nervous system obtundation and a low incidence of emesis—formerly a common complaint.

However, halothane remains an extremely expensive drug at more than $20 for a four-ounce bottle (ether costs approximately 50¢ for the same amount). Halothane is used in combination with other agents such as thiobarbiturates, narcotics, nitrous oxide, and muscle relaxants, although it may rarely be used alone with oxygen. The stigma of hepatotoxicity has never been completely removed, but the relationship between agent and lesion has never been documented. It may be that in certain patients, halothane should not be used.

A primary problem concerns the training of "generations" of residents skillful in halothane administration but having little or no experience with diethyl ether, trifluoroethylene, fluoroxene, and methoxyflurane, etc. A problem with many anesthesiologists in practice and in training is nonversatility. The fact that conduction anesthesia in some areas of the country is not practiced because of medicolegal reasons constitutes another reason why general anesthesia, and therefore halothane, has become more popular.

5. **Acute Pulmonary Care** Presently, anesthesiologists, more than any other specialists, have busied themselves either on a part- or full-time basis with patients in need of intensive respiratory care. These patients may have a tracheostomy or an endotracheal tube inserted. They may be apneic and require intermittent positive pressure breathing. Such patients may be medical (emphysematous, bronchitic), surgical (postoperative), neurologic (Guillain-Barré), or pediatric (asthmatic). Hospitals and departments of medicine, surgery, neurology, and pediatrics have realized that death from malfunction of a ventilator or an error in respiratory care occurs more rapidly than from most other errors. Consequently, the need for an area specifically designed for the management of patients requiring the complicated nursing and medical treatment involved with intensive respiratory care has arisen. In those pilot centers where such respiratory care centers have functioned, mortality appears to have decreased significantly.[10]

Anesthesiologists have begun to seek occupation in such units. Their background is superb for this since they are well-trained in the use of ventilators, and their expertise in the management of obstruction, tracheal intubation, and respiratory gaseous agents is probably better than in any other specialty. The formation of a new medical specialty may be occurring and it is reasonable that, since cardiologists, endocrinologists, rhinologists, etc have evolved from parent specialties, a spin-off from anesthesia—the pulmonist —may occur. Such an individual would be involved in the care of the type of patients mentioned on a full-time basis and would have little to do with the ad-

ministration of anesthetic agents for the relief of surgical pain.

Simultaneously, the development of Sections on Inhalation Therapy and the growth of a group of technicians known as Inhalation Therapists have entered the scene.[11] Presently, there are about 700 Registered Inhalation Therapists in the United States. As of 1970, all candidates for Registry examination must have an Associate Degree or two years of college work which may include credit for inhalation therapy courses plus a type of "internship" year under medical direction before taking the Registry examination. They should, therefore, for equal length of training and similar importance in the care of patients, be at a level from a professional and pay standpoint equal to the three year diploma school Registered Nurse or the Associate Degree nurse on graduation. The logical specialist to supervise and train this professional individual is the anesthesiologist. The combination of the development of acute pulmonary care units and the specialty of inhalation therapy both under the care, guidance, and tutelage of anesthesiologists is a phenomenon and responsibility which must be recognized by our specialty at this time.

6. **Professional Liability** The number of malpractice suits and the amounts of subsequent awards have increased logarithmically in the past few years. Insurance companies have raised their premiums in a similar fashion. In some instances, anesthesiologists are unable to obtain malpractice coverage and this has led physicians to move to other states or to accept positions at government hospitals, where insurance is provided by the employer. Other physicians no longer teach residents in private hospitals, because premiums for coverage of negligent acts on the part of their trainees have become prohibitive. Most discouraging (in the face of the already inadequae number of anesthesiologists) is that some physicians reportedly have been forced to abandon the practice of anesthesia.[12]

Unfortunately, no single insurance company will underwrite anesthesiologists as a national group because they are in the highest risk category, and the American Society of Anesthesiologists is too small a group to undertake establishment of its own insurance company. Help *must* come through action from state medical societies. Only they are powerful enough to bring pressure on state legislatures and state insurance commissions for action. Anesthesiologists, by supporting and becoming more active in these societies, can bring about such changes. State insurance regulations can be enacted to change rules of evidence, limit the amounts of the awards, require patients to submit to arbitration and compel insurance companies to lower premiums. Without these changes, the medical care of patients will be adversely affected. Surely this argument must influence political officeholders and the legislature, and make them aware of the problem.

An alternative solution might be the requirement that patients have some type of hospital accident liability insurance. This would involve patient participation from a philosophical and financial standpoint.

Predicting the Need for Ventilatory Assistance

JOSEPH S. REDDING, MD
Department of Anesthesiology
Baltimore City Hospitals

RONALD W. YAKAITIS, MD
Resident in Anesthesiology
Baltimore City Hospitals

Normal man is capable of markedly increasing rate and depth of breathing in response to increased need. This ventilatory reserve may be diminished by anything which impairs function of the neural mechanisms regulating breathing (eg, overdosage of respiratory depressant drugs or bulbar poliomyelitis), reduces the mechanical efficiency of the thoracic cage (eg, flail chest syndrome), or increases the resistance to flow in the airways or lungs (eg, emphysema or pneumonia). The respiratory muscles must perform the necessary work to overcome thoracopulmonary resistance and provide adequate ventilation to maintain arterial blood O_2 and CO_2 at normal levels. Consequently, any condition which reduces the patient's ability to perform respiratory work, or which increases the thoracopulmonary resistance, reduces ventilatory reserve and may ultimately lead to ventilatory failure.

Preoperative evaluation of the patient's cardiorespiratory status is obviously a major responsibility of the anesthesiologist. In addition to determining the fitness of the patient to survive the alterations in physiology which occur during the perioperative period, and predicting the ultimate effect of the proposed surgical procedure on ventilation, the anesthesiologist must be able to anticipate the likelihood of the patient needing postoperative ventilatory support.

Physical examination of the patient, at rest before surgery, gives little information regarding ventilatory reserve. Observation of the excursion of the chest and auscultation of breath sounds are notoriously misleading guides to judging the adequacy of ventilation. Radiographic examination often fails to reveal evidence of functional abnormalities of the lungs. Considering the sedentary habits of our population, it is not surprising that even a careful history will fail to elicit clues to ventilatory limitations in many patients who are not in the habit of climbing stairs or taking long walks. Complex tests of pulmonary function are time consuming, expensive, and poorly correlated with the physiologic changes associated with various operative procedures. Consequently, they are of limited usefulness in evaluating the many patients who will undergo marked alterations in ventilatory ability during the perioperative period. Similarly, arterial blood gas determinations are of value only in assessing the adequacy of ventilation immediately before the blood

was drawn, and give no information regarding ventilatory reserve until there no longer is a reserve.

A major factor leading to postoperative pulmonary complications is the patient's inability, due to pain, to cough effectively and clear his airway of accumulated bronchial secretions. For a cough to be effective the patient must be capable of forcibly exhaling a sufficient volume of air at a high enough flow rate to sweep accumulated mucus out of the airway. Therefore any factor, such as muscle weakness or splinting of the respiratory muscles due to pain, which limits the volume of forced inhalation reduces the effectiveness of the cough. After maximal inhalation, pressure must be built up behind the closed glottis. For this reason, the effectiveness of coughing is reduced in any patient in whom an endotracheal tube or tracheostomy cannula is in place. Finally, during an effective cough, there is an explosive decompression of the lungs which develops a high expiratory flow rate. Consequently, conditions such as obstructive emphysema limit the maximal expiratory flow rate and reduce the effectiveness of the cough. Undoubtedly other abnormalities such as reduced minute volume, inability to sigh, etc, promote alveolar collapse and subsequent sequestration of organisms in the affected portions of the lungs. Measurement of Timed Vital Capacity (TVC) simulates the act of coughing, so that the test provides an adequate and convenient method of assessing the patient's ability to clear his airway of secretions.

Miller, et al,[1] correlated preoperative and postoperative TVC measurements with the clinical course of hundreds of patients. They found that even though appreciable degrees of restrictive or obstructive ventilatory disability existed, the patient was able to avoid ventilatory failure as long as TVC was above 25% of the predicted normal value. When TVC fell below this level, carbon dioxide retention ensued in the absence of ventilatory support. The presence of an appreciable obstructive component (reflected by a reduction in the volume exhaled in the first 0.5 sec of the test) compounded the problem.

For several years our department has used a modification of Miller's approach to provide a quantitative assessment of ventilatory reserve in patients who may be candidates for ventilatory support. We routinely measure TVC on all patients scheduled for upper abdominal or thoracic surgery, as well as those in whom history or physical examination suggest probable ventilatory limitation.

The test is simple to perform, and may be done on many patients in the course of a day's work. The patient is instructed to take the deepest possible breath and exhale as rapidly and completely as possible through a mouthpiece into a bellows spirometer.* The volume of this forced expiration is recorded on a calibrated chart which is moved at a standard rate of speed by an electric motor. The readout is a curve which relates volume in liters to time in seconds.

Figure 1 shows a typical tracing in a healthy adult. The volume exhaled is compared to a nomogram and expressed as a percentage of normal for the patient's sex and height. The volume exhaled in the first second of this single breath test ($FEV_{1.0}$) is expressed as a percentage of the patient's measured vital capacity.

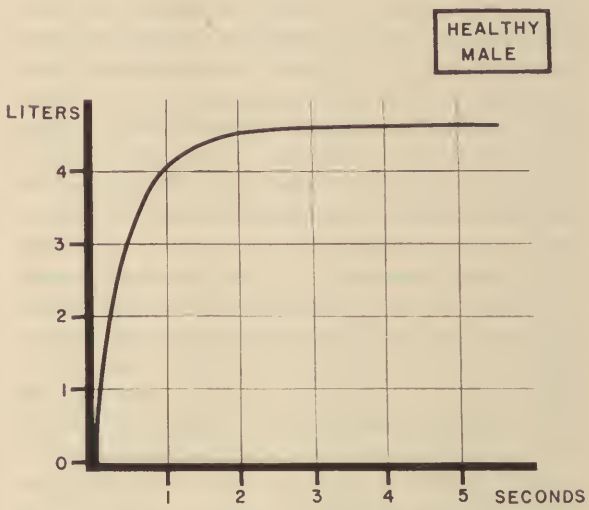

Fig. 1: Timed Vital Capacity tracing in a healthy adult. Volume exhaled (4.8 l.) is expressed as TVC = 100% of predicted normal. Forced expiratory volume exhaled in the first second (4.0 l.) is expressed as $FEV_{1.0} = 83\%$ of TVC.

Reduction of TVC below 80% of the predicted normal value indicates a reduced displaceable lung volume due to restrictive disease of the lungs or thorax. Reduction of $FEV_{1.0}$ below 75% of the patient's measured vital capacity indicates reduction of maximal expiratory flow rate due to obstructive disease of the lungs or airways. Figure 2 is a modification of Miller's quadrant system for identifying the nature and extent of ventilatory insufficiency. Test results on a normal individual lie in the upper right hand corner. Those with pure obstructive disease lie in the lower right hand area, while those with pure restrictive problems lie in the upper left quadrant. Patients with both restrictive and obstructive components lie in the large area at the lower left. The dotted curve labeled Marginal Reserve represents impending ventilatory failure. Patients whose test results lie above the curve may be normal, or have appreciable degrees of restrictive, obstructive, or mixed disabilities; yet they are capable of clearing their airways of accumulated secretions and ventilating themselves. If a patient's test results fall under the curve, he is likely to be in frank ventilatory failure, which can be confirmed by

* *McKesson Vitalor®*

arterial blood gas analysis. On the other hand, if his test results are on or just below the curve, he may be ventilating adequately at the moment but may lack sufficient reserve to continue to clear his airway and avoid ventilatory failure.

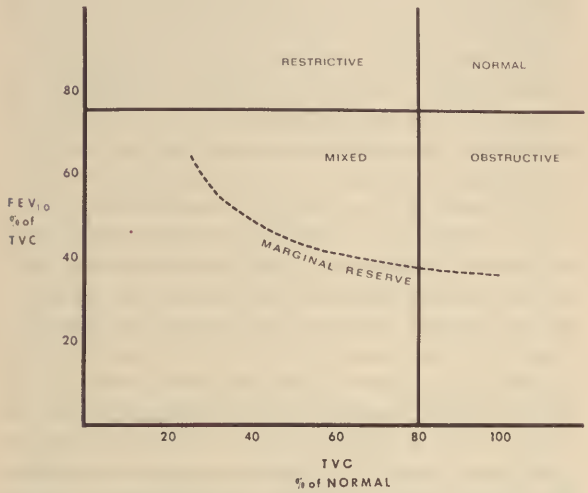

Fig. 2: Modification of Miller's quadrant system for defining the nature and extent of ventilatory insufficiency. Dotted curve indicates level at which ventilatory support should be instituted to avoid ventilatory failure.

Miller, in the 1950's, considered patients whose test results fell under the curve to be prohibitive risks for anesthesia and surgery. Our approach has been to institute ventilatory support whenever test results fall to, or below, the curve, even though arterial blood gas values may, at the time, be normal. Careful attention to thorough tracheobronchial toilette through an endotracheal tube or tracheostomy, and to providing controlled hyperventilation with a mechanical ventilator prevent development of atelectasis and ventilatory failure.

With modern anesthesiologic techniques, provision of adequate ventilatory assistance or control during the operative procedure rarely poses an unmanageable problem. However, anticipation of the need for postoperative ventilatory support is necessary if serious pulmonary complications are to be avoided. The effects of surgery on postoperative ventilation are due to pain in the operative site leading to muscle spasm, and are reasonably predictable. Surgery of the head, neck, extremities and perineum may be painful; but postoperative ventilation is unaffected since the respiratory muscles are not involved. There is an average reduction in TVC of 30% at the peak of postoperative pain following lower abdominal incisions, and a reduction of 50% after upper abdominal or thoracic incisions.[2] A further reduction must be anticipated if functioning lung tissue is removed during a thoracotomy.

Reductions of this magnitude may cause serious complications in patients with limited ventilatory ability before surgery. Figure 3 shows TVC tracings made on a patient preoperatively, and at the peak of pain after upper abdominal exploration. It can be seen that the preoperative TVC was less than 50% of the predicted normal value. At that time, physical examination did not indicate ventilatory limitation. Postoperatively the TVC fell below 25% of predicted normal. The patient developed ventilatory failure and required mechanical ventilation.

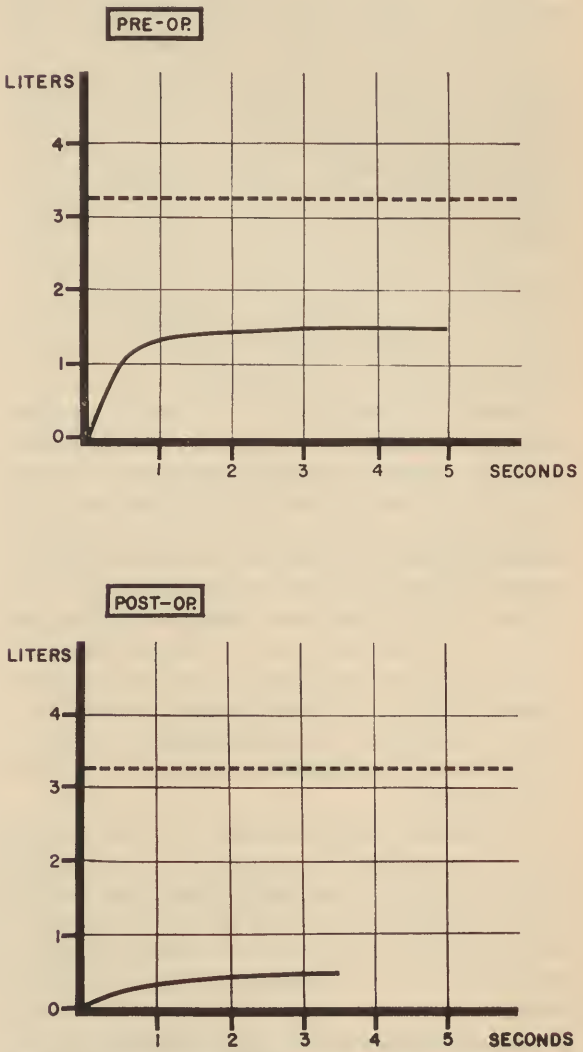

Fig. 3: Timed Vital Capacity tracings before and after upper abdominal exploration. Postoperative reduction in TVC and $FEV_{1.0}$ due to pain, was followed by ventilatory failure. Dotted lines indicate normal value for this patient.

The figures given for reduction of TVC after various operations are averages, and there are individual

variations in the response to pain. Only repeated measurements can be relied on in a given patient. It is important to note that the figures given represent the maximal reduction in TVC which occurs at the peak of postoperative pain. Postoperative pain usually is most pronounced on the second postoperative day. We commonly observe that TVC measured immediately after the patient awakes from anesthesia shows a less pronounced reduction than anticipated because of residual analgesia. In such cases, the test is repeated at intervals during the postoperative period, and supportive treatment is instituted if subsequent test results fall below the Marginal Reserve curve.

TVC which is reduced because of postoperative pain can be improved by effective analgesia. Under these circumstances, morphine usually produces a distinct improvement in TVC.[3] However, its use in the patient with severe ventilatory limitations may be undesirable because it depresses other parameters of ventilation. Morphine has been shown to reduce the intermittent sighing of conscious healthy people [4] which is an important protective mechanism in preventing alveolar collapse. We have recently observed that awake analgesia with methoxyflurane, self-administered by patients after upper abdominal or thoracic surgery, produces as much improvement in TVC as 10 mg morphine without the depression of alveolar ventilation observed after morphine.[5]

Accurate measurement of TVC cannot be made while an endotracheal tube or tracheostomy cannula is in place. However, a useful approximation of total vital capacity can be recorded, provided the endotracheal tube or tracheostomy cannula is fitted with an inflated cuff. The maximal volume the patient is capable of exhaling can be recorded by means of an accurate and portable ventilometer.* This approximation can be recorded even in unconscious or uncooperative patients by measuring the volume of air coughed by the patient when the endotracheal tube is moved. This cannot be accomplished, of course, in a deeply unconscious patient, or one with a depressed cough reflex.

Candidates for thoracic surgery pose special problems. It is necessary to predict both the adequacy of ventilation during the immediate postoperative period and the ultimate effect of the surgical procedure on ventilation. In our practice, most patients scheduled for thoracotomy have some preoperative ventilatory limitation. Pain from the thoracotomy incision causes an average reduction of 50% of the preoperative TVC. A further reduction must be anticipated which is proportional to the amount of functioning lung tissue removed during the operation. Since the reduction in function due to incisional pain can be compensated for by proper tracheobronchial toilette and a mechanical ventilator, the important question to be answered is the ultimate ventilatory ability after pain subsides.

Although a patient with a single healthy lung can live a very active life after he has recovered from surgery, often pulmonary resection is proposed on patients with bilateral disease. In these cases it is necessary to determine in advance that a disproportionate amount of functioning lung tissue will not be removed. Function is normally distributed 45% in the left and 55% in the right lung. This distribution is often grossly altered by pathology. Separate and simultaneous spirographic examination of each lung through a Carlens double lumened endotracheal tube provides the best guide to the true distribution of function between the two lungs.[6] Pneumonectomy may cause no reduction in function if the resected lung was already functionless, while lobectomy may have serious consequences if the lung on the operative side was responsible for most of the preoperative function. Those patients whose functions will lie on or under the Marginal Reserve curve after the immediate effects of surgery subside are considered prohibitive risks for the proposed operation. If the operative procedure is carried out, either the patient will develop ventilatory failure when removed from the ventilator, or will have so little reserve that ventilatory failure will be precipitated by minor pulmonary infections. When the situation is predicted, the operative procedure must be modified or an alternative form of therapy must be found. Sometimes the ultimate effect of surgery on ventilation is an improvement when a nonfunctioning space occupying lesion is removed, when pleurectomy releases a restricted lung, or when pulmonary congestion is relieved by a cardiac procedure.

As a measurement of TVC which falls below the Marginal Reserve curve indicates the need for ventilatory support, similarly, serial measurements which rise above the curve with subsiding pain or improvement in the patient's pathology indicate that it is safe to begin weaning him from support. During this process it must be remembered that use of mechanical ventilators puts the respiratory muscles at rest with a consequent loss of muscle tone. If ventilator support is abruptly withdrawn, excessive fatigue may cause the patient to underventilate. It also is necessary to extubate the trachea or close the tracheostomy as soon as it is no longer essential for tracheobronchial toillette, since a truly effective cough cannot be produced until the patient is able to build up pressure behind a closed glottis.

The following case is illustrative of the usefulness of this approach in predicting a patient's postoperative course:

A 57-year-old woman, 60 inches tall, was scheduled for correction of severe mitral stenosis with a history of congestive heart failure. Her predicted normal TVC was 3000 ml. Preoperatively her measured

* *Wright Respirometer®*

TVC was 1100 ml, or 36% of predicted normal. Her $FEV_{1.0}$ was 850 ml, or 77% of the measured TVC. This represented a severe restrictive ventilatory disability without an appreciable obstructive component. It was thought that the restriction was due to pulmonary congestion with probable interstitial fibrosis, and that this might be partially alleviated by correction of the valvular defect. It was predicted that she would require ventilatory support during the immediate postoperative period, and that her ventilatory ability would improve to or above the preoperative level as postoperative pain subsided.

Mitral valvulotomy was performed through a midline sternal splitting incision. At the end of the procedure, her nasotracheal tube was connected to an Emerson respirator, and mild continuous hyperventilation was begun. During the evening of the day of operation the volume she was able to cough through the endotracheal tube was found to be 750 ml. On the morning of the first postoperative day this volume had decreased to 300 ml. On the second postoperative day the volume coughed was about 700 ml. It was decided to replace her nasotracheal tube with a tracheostomy for greater patient comfort and security. On the fourth postoperative day she was able to cough 1000 ml, or 33% of predicted normal TVC. She was removed from the ventilator and repeated arterial blood gas determinations were within normal limits. The tracheostomy was closed to permit her to cough more effectively. There were no postoperative complications and she was discharged from the hospital on the fourteenth postoperative day. At that time her TVC was 46% of predicted normal and the $FEV_{1.0}$ was 78%.

This simple test should be interpreted with certain reservations. Like any laboratory test it is a supplement to other knowledge regarding the patient's condition, and it should not provide a basis for treatment when the test results contradict everything else that is known about the patient. Although the test is not highly precise, duplicate determinations should check within 100 ml if the results are reliable. The test measures only a single forced expiration and does not give a total picture of the patient's ability to ventilate himself. For the test to be reliable, the patient must understand what is expected of him and must be willing to cooperate. He must be able to make a leakproof seal with his lips around the mouthpiece. Most erroneous test results are falsely low because the patient does not understand or will not do what is desired, is edentulous and cannot prevent leaks, etc. Occasionally the test can be misleading on the high side. A patient with inspiratory airway obstruction, for example one with flaccid vocal cords, may be able to inhale slowly and then produce a normal forced expiration, even though he has severe ventilatory limitations. A patient with myasthenia gravis often can produce a single normal forced expiration but fatigues with repeated efforts. In either case the extent of ventilatory limitation is better demonstrated by measurement of maximal breathing capacity.

TVC measurements, interpreted in this fashion, provide a useful guide to safe institution and withdrawal of ventilatory support in many conditions, other than postoperative pain, which may lead to ventilatory failure. The same approach is applicable to the patient with progressive ventilatory insufficiency from bulbar poliomyelitis, Barré-Guillain syndrome, flail chest from multiple rib fractures, etc. The test does not provide guidelines for use of mechanical ventilators for such purposes as controlling pulmonary edema or production of respiratory alkalosis to reduce intracranial pressure.

Problems in the Management of Drowning Victims

Over 6,000 people die from drowning each year in the United States. Most of them are young and in good health. No single disease kills as many people under 24 years old.[1] In spite of the magnitude of the problem, relatively little is known about this fatal accident.

Pathophysiology

Postmortem examination of drowning victims often shows a striking light pink coloration of the skin suggestive of carbon monoxide poisoning. Goose flesh is common. Frothy pulmonary edema fluid usually fills the lungs and airway and exudes from the nose and mouth. The lungs appear hyperexpanded, and petechial subpleural hemorrhages are common. Microscopic examination may reveal seaweed, sand, mud or algae in the lungs and airway. There is diffuse capillary congestion of the alveolar walls. The upper gastrointestinal tract may be filled with ingested fluid and foreign material. Biochemical and morphologic alterations in the blood may be discovered. These changes only suggest the drastic physiologic alterations which precede death.

Although detailed observations on humans during the process of drowning have not been reported, experimental evidence indicates that submersion is followed by a period of breath holding and struggling [2] of markedly variable duration. This is followed by swallowing of large volumes of water and vomiting. Laryngospasm may prevent flooding of the lungs until asphyxia produces flaccidity. Some victims may die during the process of asphyxia, before water enters the lungs. As asphyxia progresses, the victim's glottic muscles relax, and subsequent events are determined by the composition of the fluid which floods the lungs.

In fresh water drowning, large volumes of water pass with extreme rapidity through the lungs into circulation. There is marked hemodilution with massive hemolysis and lowering of blood concentrations of sodium, chloride, calcium, and plasma proteins.[3] Should both asphyxia and hyponatremia from the hemodilution be severe enough, sudden ventricular fibrillation may be the cause of death. If fibrillation does not occur, or if it is corrected, the massive hypervolemia results in fulminating pulmonary edema and heart failure.

Sea water contains 3.5% mixed salts. It is markedly hypertonic compared to blood. When sea water is aspirated, these salts diffuse into the blood with rapid elevation of the plasma sodium. The osmotic effect of the sea water causes loss of large amounts of fluid from the circulation into the lungs. As the alveolar membrane is damaged, plasma protein is also lost into the lung fluid. The end result is a fulminating pulmonary edema, hypotension, bradycardia, and death.

Resuscitation

Most victims of submersion will either survive spontaneously, not having been submerged so long that resuscitation is necessary, or will be beyond any help. It must be remembered that the apparent duration of submersion is a very unreliable guide to the physiologic condition of the victim.

When a victim is removed from the water, breathing and vigorous coughing suggest that hypoxic damage is slight and that little water has been aspirated. If the patient is conscious, and not cyanotic, he should be transported to a hospital for physical examination, chest X-ray, and examination of blood and urine.

If there are no breathing movements, time must not be wasted. No attempt should be made to drain water from the lungs since this cannot be accomplished effectively.[4] The pharynx should quickly be cleared by the rescuer's fingers and the head and jaw properly positioned to relieve soft tissue obstruction of the airway. Exhaled air resuscitation is then started immediately. The lungs can be ventilated by blowing through any fluid which may be in the airway. After the first successful lung inflation, the pulse in the carotid artery should be checked. If it is not palpable, closed chest cardiac massage must be started and continued along with artificial ventilation of the lungs. Intermittent positive pressure breathing with oxygen should be substituted for exhaled air as soon as the necessary equipment becomes available. Both artificial respiration and closed chest cardiac massage must be continued while the victim is transported to a hospital. Cardiac massage may be discontinued if a spontaneous pulse becomes palpable in the carotid. Positive pressure ventilation should not be discontinued even if spontaneous breathing efforts return. In this event, the victim's inspiratory efforts should be assisted with positive pressure oxygen.[5]

Definitive Treatment

When the victim reaches a hospital, if a spontaneous pulse is still not palpable, 1 mg of epinephrine should be injected by the intracardiac or intravenous route. The dose should be reduced for children under 18 months of age. If there is electrocardiographic evidence of ventricular fibrillation, external countershock should be used to correct it.[6] Artificial respiration and circulation should be continued, along with intravenous administration of peripheral vasoconstrictor drugs such as phenylephrine or methoxamine, until spontaneous circulation is restored.

Once spontaneous circulation is restored, blood and urine should be examined, a chest X-ray should be taken, and an adequate physical examination performed. Intermittent positive pressure breathing should not be discontinued at this time. Tracheal intubation should be used to facilitate mechanical ventilation for the first 48 hours. If a respirator is needed for longer periods, it is usually advisable to replace the tracheal tube with a tracheostomy. Fluid and electrolyte redistribution occurs very rapidly after aspiration of either fresh water or sea water. Blood specimens drawn 30 to 60 minutes after aspiration may reveal little evidence of the magnitude of the physiologic insult. If a serious degree of hemolysis has occurred in victims of fresh water drowning, partial exchange transfusion may be considered. Following sea water aspiration, administration of plasma may be essential to restore the circulating blood volume.[7] In either type of drowning, monitoring of the central venous pressure provides a minute-to-minute indication of the effectiveness of treatment. The following cases illustrate some of the difficulties encountered in managing drowning victims after successful resuscitation and correction of the circulatory alterations resulting from asphyxia and massive aspiration.

Case 1 (Fresh Water Drowning): A previously healthy 10-year-old white boy received successful cardiopulmonary resuscitation after drowning in a fresh water river. He was received in the emergency room 30 minutes later, at which time he was obtunded and made frequent wild, purposeless movements. Vital signs were: BP 160/80, P 140, R 58, T 104°F. His pupils were small and reacted to light. Ronchi were heard throughout both lung fields, and chest X-ray showed bilateral pulmonary densities suggesting pulmonary edema. Studies of blood and urine were not remarkable.

An anesthesiologist administered O_2 and passed a nasotracheal tube to facilitate positive pressure breathing with an Emerson (volume cycled) respirator delivering 50%-80% O_2. Later that evening a tracheostomy was performed, and an indwelling urethral catheter was inserted. Urine output ranged from 15-65 ml/hr.

Ampicillin and hydrocortisone were started intravenously. To minimize cerebral edema body temperature was reduced to 30.5°C. To prevent shivering during the process of cooling, meperidine, chlorpromazine and curare were given.

Next day the child remained comatose, chest X-ray showed marked improvement of the pulmonary edema, and an electroencephalogram indicated probable damage in the left temporal and right frontal regions. Hypothermia, ampicillin and hydrocortisone were continued.

On the third day, hypothermia was discontinued and cultures of tracheobronchial secretions were negative for pathogens. The fifth day after drowning, the patient was noted to be more responsive and the following day he was alert and able to take a full liquid diet.

One week after admission, an attempt was made to withdraw respirator support. Tachypnea and cyanosis quickly developed. Spontaneous breathing

of 100% O_2 for periods of 10 to 15 minutes every two hours was tolerated fairly well. Chest X-ray showed a recurrence of bilateral infiltration and consolidation.

During the next two days the lung findings failed to improve, coagulase positive staphylococci sensitive to all antibiotics and pseudomonas organisms were cultured from the tracheobronchial secretions, temperature rose to 100°-102°F, and the WBC rose to 30,000. Antibiotic therapy was intensified and the O_2 concentration used to ventilate the patient was reduced to 35%-45%.

Eleven days after being resuscitated, while using a bed pan, the patient suddenly fell back and asystole was noted on the cardiac monitor. Resuscitative efforts failed.

At autopsy the lungs appeared fibrotic and an extensive thrombosis was found in the right pulmonary artery. Histologic sections demonstrated pulmonary hyaline membranes, pneumonitis, thromboembolism and focal infarction. These changes were considered to be compatible with the effects of both aspiration and O_2 therapy.

Case 2 (Sea Water Drowning): Cardiopulmonary resuscitation restored spontaneous pulse and respirations in a previously healthy 47-year-old white man 20 minutes after he drowned in sea water. He was received in the emergency room 30 minutes later and was noted to be semiconscious and hyperactive, with BP 140/90, P 60. He was tachypneic but not cyanotic. Pupils were partially dilated but reacted to light. He was bleeding from the right ear and mouth. Loud ronchi were heard in both lungs and there were crepitant rales in both bases. Chest X-ray showed patchy areas of consolidation in both lungs, most pronounced in the right lower lobe. Blood and urine studies were not remarkable.

An anesthesiologist administered O_2 and failed to intubate the trachea because of large amounts of blood in the pharynx. A tracheostomy was performed and a large pharyngeal laceration was discovered and sutured. Ventilation by means of a Bennett MA-1 (pressure cycled) respirator using 40% O_2 was begun. A nasogastric tube and bladder catheter were inserted. Body temperature was reduced to 90°-92°F while meperidine and curare were used to prevent shivering. Chloramphenicol and hydrocortisone were started, the patient was given ethylcrynic acid and he was digitalized. An electrocardiogram showed no evidence of myocardial damage.

Next day the patient was still semiconscious. While being ventilated with 40% O_2 his arterial blood revealed PO_2 85 mmHg, PCO_2 40 mmHg, and pH 7.30. Hypothermia was discontinued.

On the fifth day the patient was transferred to another hospital while being artificially ventilated. He had become alert and responsive, and chest X-ray showed considerable clearing of the right lower lobe. He was placed on an Emerson respirator utilizing 44% O_2. At that time his arterial blood showed PO_2 37 mmHg, PCO_2 36 mmHg, and pH 7.44. The inhaled O_2 concentration was increased to 72%. His temperature rose to 103°F and cooling was reinstituted.

The patient continued alert and oriented until the eighth day. Cooling was necessary to prevent hyperthermia, and pseudomonas aeruginosa was cultured from the tracheal secretions. Appropriate antibiotics were given. It was found necessary to gradually increase the O_2 concentration delivered by the respirator in order to prevent a dangerous fall in arterial PO_2. On the eighth day after drowning, the patient was cyanotic in spite of hyperventilation with 100% O_2. Arterial PO_2 had fallen to 33 mmHg. Four consecutive episodes of ventricular fibrillation occurred, and resuscitative efforts failed on the fourth attempt. Permission for autopsy was denied.

Case 3 (Sea Water Near-Drowning): A previously healthy 16-year-old white man was removed unconscious from sea water but cardiopulmonary resuscitation was unnecessary. He was taken to a hospital where he regained consciousness, and was given O_2 by mask and hydrocortisone intravenously. A nasotracheal tube was inserted by an anesthesiologist, and a laceration of the right ear was sutured. He was then transferred to another hospital.

On admission he was comfortable and acyanotic. Diffuse ronchi were heard in both lungs and chest X-ray revealed generalized haziness and infiltrative densities throughout both lung fields. Arterial blood revealed PO_2 42 mmHg, PCO_2 40 mmHg, and pH 7.23. He was placed on a Bird (pressure cycled) respirator delivering 100% O_2. Hydrocortisone was given intravenously.

Next day he was alert and responsive and chest X-ray showed definite clearing of the pulmonary infiltrates. An attempt was made to ventilate him with air, but the arterial PO_2 fell to 45 mmHg. The O_2 concentration was maintained at 30% during the night.

On the third day his chest X-ray showed further improvement and his vital capacity was 1800 ml. He was allowed to breathe air spontaneously, and was then extubated. Tracheal cultures from the previous day showed D pneumoniae. He was treated with penicillin and was discharged after being afebrile for 48 hours. Chest X-ray on discharge showed only a slight infiltration in the right middle lobe.

Discussion

Rapid and specialized attention to many facets of care is necessary in managing a patient after resuscitation from drowning. Immediately following restoration of spontaneous circulation, the patient's state of consciousness is the best indication of success in preserving cerebral function. Usually the victim is obtunded, and the earlier reflex activity returns, the

more likely he is to recover fully. Steadily progressive return of consciousness is encouraging compared to those patients who show plateaus during which no progress is observed. The electroencephalograph may be of assistance in following the course of returning cerebral function.

It is desirable to cool the obtunded patient's body temperature to about 30°C without delay after resuscitation. This reduces cerebral oxygen consumption and carbon dioxide production. Shivering, with an increased metabolic rate, may be prevented by the use of narcotics or neuromuscular blocking agents.

Asphyxia and circulatory arrest lead to cerebral edema. The resulting increase in intracranial pressure results in further death of cells. Passive hyperventilation on a respirator, which produces respiratory alkalosis and cerebral vasoconstriction, and osmotic diuresis are aimed at reduction of the intracranial pressure.

Massive doses of steroids should be given intravenously as soon as possible after resuscitation. The purpose is twofold—to prevent cerebral edema and to minimize the inflammatory response to aspiration of fluid, often mixed with gastric contents.

Once the circulatory disturbances are controlled, the most severe problem in the continued management of any patient who has been resuscitated from drowning is arterial hypoxemia and acidosis.[8] Loss or alteration of lung surfactant material and damage to the alveolar membrane lead to extensive areas of nonventilated lung through which pulmonary blood flow is shunted. Consequently, arterial blood should be drawn for determination of pH, PCO_2, and PO_2 as soon as possible. This makes possible accurate correction of metabolic acidosis with sodium bicarbonate. Ventilation of the patient with the respirator should be regulated to produce a moderate degree of respiratory alkalosis, and the percentage of oxygen in the inhaled gas mixture should be adjusted to maintain arterial PO_2 in the range of 60-90 mmHg.

Pulmonary shunting usually subsides over a period of 48 to 72 hours. Consequently, repeated arterial blood gas determinations are necessary to regulate the degree of ventilation and the inhaled oxygen concentration as the status of the lung changes. It is important to avoid giving excessive oxygen concentrations since further damage to the alveoli may result,[9] but it is imperative to give as high a concentration as necessary to prevent dangerous arterial hypoxemia. Constant attention is necessary to humidification of the inhaled gas, asepsis during suctioning of tracheal secretions, artificial coughing and sighing, and frequent changes in the patient's position. When the severity of the pulmonary shunt subsides, as indicated by the arterial blood gas determinations, spontaneous breathing may be permitted, but supplementary oxygen is often still necessary.

Pulmonary infection is a common complication in the patient who has a tracheostomy or endotracheal tube in place,[10] and this problem is magnified in the drowning victim in whom the damaged respiratory membrane presents a tremendous abraided surface for secondary bacterial contamination. Consequently frequent cultures must be taken, and the appropriate antibiotic therapy must be intensive.

In the three cases presented, certain features are of interest. Resuscitation of the two victims of drowning was successful. Circulation was restored and controlled, and cerebral damage was prevented since both patients were conscious and oriented. The pulmonary sequelae of aspiration were effectively managed by diligent attention to artificial ventilation with oxygen concentrations necessary to prevent recurrence of circulatory arrest. However, the prolonged use of high oxygen concentrations necessitated by the severity of the damage may have caused further alveolar changes. Bacterial invasion then contributed to the outcome. The third case was treated for near-drowning (submersion and aspiration, without circulatory arrest) and ultimate recovery may have been due to the lesser magnitude of the insult.

Management of the drowning victim can be considered to involve three phases:

1. Initial resuscitative measures must be started as soon as the victim is recovered from the water, and continued during transportation to a hospital where any definitive measures can be carried out to restore spontaneous circulation and control circulatory abnormalities.

2. There must be no delay in effective treatment aimed at minimizing cerebral edema and the inflammatory response to aspiration.

3. Extensive pulmonary shunting must be compensated by continued mechanical ventilation with whatever oxygen concentrations are necessary to prevent arterial hypoxemia, and secondary bacterial pneumonitis must be prevented or controlled.

your medical faculty at work

by John Sargeant
Executive Secretary

The Executive Committee met on Saturday, December 13, 1969, and took the following actions:

1. Approved two travel requests for 1970, prior to preparation and approval of the 1970 budget;
2. Authorized the Executive Secretary, on an annual basis, to establish suitable closing and opening schedules for the Faculty building during the Christmas and New Year holidays;
3. Authorized an annual Christmas party for the staff;
4. Deferred action on proposed Radiation Control Regulations until they have been given further study;
5. Adopted proposed Blood Bank regulations as requested by the Department of Health and Mental Hygiene;
6. Heard that a chiropractor was not qualified to testify as a medical expert in a case before the State Court of Appeals; and that the Amicus Curiae brief filed by the Faculty in this regard had not been ruled on;
7. Decided to reaffirm its previous position concerning services provided by a physician to Medicare patients;
8. Declined to discuss further the question of the bond issue for the Physicians Memorial Hospital in La Plata, as a result of a letter sent to a Council member asking for his intercession in this matter;
9. Determined that the Program and Arrangements Committee should endeavor to schedule the Annual Meeting later in the spring; and encouraged staff to prepare as many annual reports as possible for consideration by the House at the 1970 annual session;
10. Deferred action until the next meeting on (a) a proposed questionnaire to be distributed to Faculty members discussing services of the Faculty and (b) discussion of a feasibility study in connection with medical economics;
11. Agreed to cooperate with the Drug Abuse Authority in a proposed study of the Attitude of Physicians to Treatment of Drug Abusers;
12. Adopted a statement and resolution on Hazards of Cigarette Smoking (see below);
13. Deferred action on a resolution concerning Transportation of Psychiatric Patients, until further information can be obtained;
14. Referred a proposal dealing with arbitration panels for professional liability cases to the Medical Economics Committee;
15. Approved the principle that the Medical Board for Occupational Diseases be continued as presently constituted in the law;
16. Deferred action on a proposed model Food and Drug Law for Maryland until it can be studied further.

The House of Delegates met on Saturday, December 13, 1969, and in special session adopted bylaw amendments that would clearly define the term "physician's defense," and what is covered by this expression. (Copy of the Bylaw changes are available on request)

Resolution Regarding Hazards of Cigarette Smoking

Submitted by Ad Hoc Committee to Develop a Resolution on the Hazards of Cigarette Smoking, of the Committee on Postgraduate Education, Preventive Medicine, and Public Health: John B. De Hoff, MD. Chairman, James D. Carr, MD, Jason Geiger, MD, Robert J. Wilder, MD.

Whereas, the physicians of this State recognize that cigarette smoking is dangerous to health and may cause death from cancer, coronary heart disease, chronic bronchitis, pulmonary emphysema, and other diseases, and

Whereas, the Surgeon General of the U. S. Public Health Service has estimated that 300,000 premature deaths and several million additional cases of serious illness and disability which are causally related to cigarette smoking occur each year in the United States, and

Whereas, the cigarette smoking habit usually begins in early adolescence, and

Whereas, the Medical and Chirurgical Faculty of Maryland is concerned in all matters relating to the public health; therefore be it

Resolved, that the Medical and Chirurgical Faculty of Maryland takes a strong stand against smoking; and be it further

Resolved, that the Faculty urges its members to work to eliminate cigarette smoking by personal example and by advice regarding the health hazards of smoking; and be it further

Resolved, that the Faculty will discourage smoking by public pronouncements, and by educational programs especially directed to young people; and be it further

Resolved, that the Faculty will discourage the sale of cigarettes in public and private diagnostic treatment and rehabilitation centers in Maryland; and be it further

Resolved, that, through appropriate channels, the Faculty will indicate to the Congress of the United States and to the Legislature of the State of Maryland the incongruity of spending tax dollars to promote or support the production and sale of tobacco while at the same time spending other tax dollars to discourage cigarette smoking because of its hazard to health.

Adopted by the Executive Committee Dec. 13, 1969

Current Reimbursement Policies of the Maryland Medical Assistance Program

Because of seeming confusion in connection with Medicaid payments to physicians throughout the State, the following brief summary of current policy in this regard is provided:

In-Hospital

For in-hospital services, private physicians with private Medicaid patients are reimbursed $10 for the first day and $3 for each subsequent day the patient is hospitalized for medical services. For surgical services the physician is reimbursed at a fee for the particular procedure rendered. This surgical fee is in lieu of the above medical reimbursement. The surgical reimbursement in most cases amounts to approximately 50% of the Usual, Customary and Reasonable fees published by the Faculty in their 1966 Fee Guide.

Home & Office

Office visits	up to $5
Home day visits	up to $6
Home night visits	up to $7

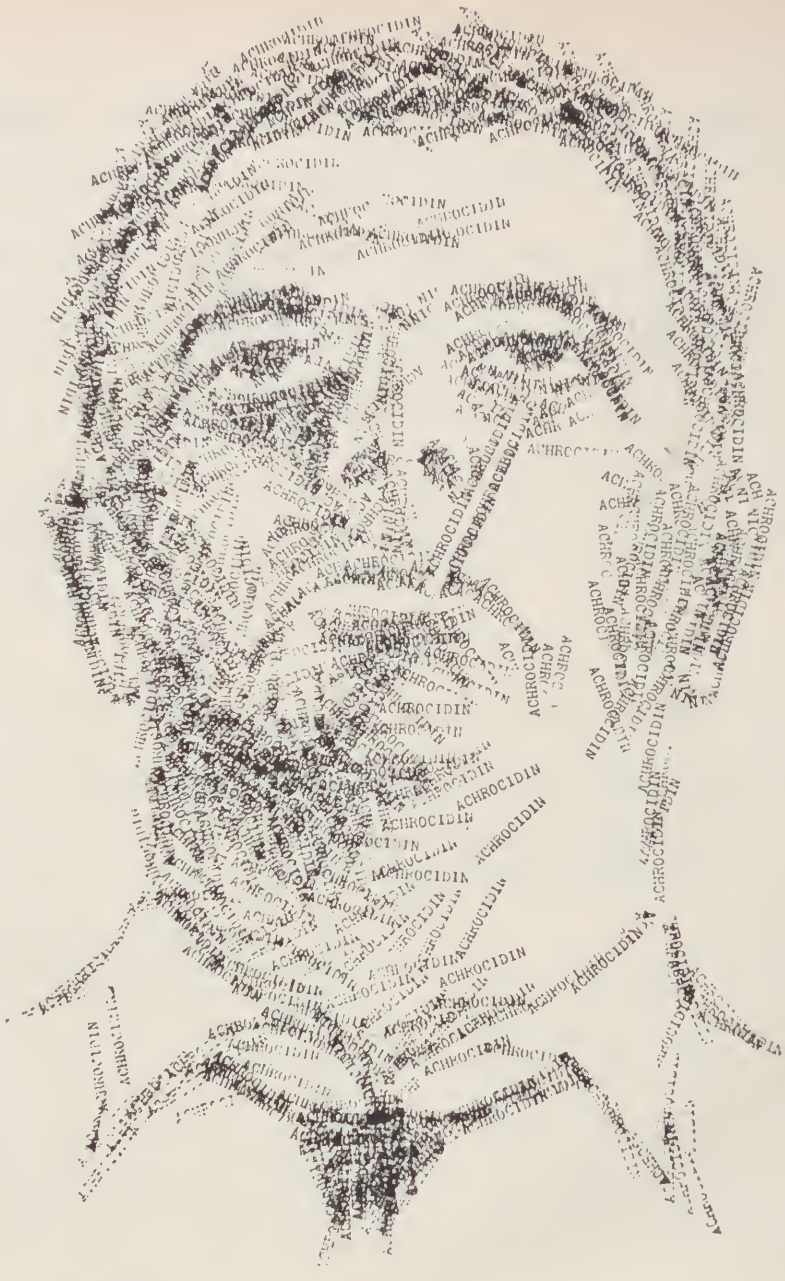
Other services which are reimbursed *in addition* to the office visit are as follows:

a) Diagnostic X-rays
50% of Professional Component in the Department of Health Diagnostic Radiology Procedure and Fee List—March 1, 1968.

b) Laboratory tests
50% of Department of Health Fee Schedule for Laboratory Procedures.

c) Dispensed or injected medications
Actual cost of drugs as verified in the Red Book or Blue Book when said drug costs the physician 50¢ or more.

d) E.K.G.
Including interpretation and report—$7.50.



e) E.E.G.
Including interpretation and report—$12.50.

f) Diathermy, Infra-red or Ultraviolet when administered by a physician—$2.50 per treatment.

Consultations

Additional allowances are made for the services of a consultant. Any physician with a specialty, and who has filed the required papers with the Medical Assistance Program, may be classified as a Consultant Specialist. Reimbursements to a Consultant Specialist for a "consultation" which was requested by the patient's attending physician is reimbursable at $20 for the first visit and $7 for subsequent visits. Consultations rendered by physicians not having Consultant Specialist status with the Medical Assistance Program are reimbursed at $10 for the first visit and $5 for subsequent visits. These fees are applicable to both ambulatory patients as well as in-hospital patients.

It is requested that all physicians continue to bill at their usual and customary charges even though reimbursement in most cases will be considerably less than this amount.

Achrocidin® Tablets and Syrup

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen Citrate 25 mg.

ACHROCIDIN Tetracycline HCl—Antihistamine—Analgesic Compound Tablets and Syrup are recommended for the treatmen of tetracycline-sensitive bacterial infection which may complicate vasomotor rhinitis, sinusitis and other allergic diseases of th upper respiratory tract, and for the concomitant symptomatic relief of headache and nasal congestion. For children and elderl patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN Tetracycline equivalent t Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15 mg

Contraindications: Hypersensitivity to any component.

Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.

Precautions: Drowsiness, anorexia, slight gastric distress can occur. In excessive drowsiness, consider longer dosage intervals. Persons on full dosage should not operate vehicles. Nonsusceptible organisms may overgrow; treat superinfection appropriately. Treat beta-hemolytic streptococcal infections at least 10 days to help prevent rheumatic fever or acute glomerulonephritis. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).

Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliativ dermatitis; photosensitivity; onycholysis, na discoloration. *Kidney*—dose-related rise BUN. *Hypersensitivity reactions*—urticari angioneurotic edema, anaphylaxis. *Intracran* —bulging fontanels in young infants. *Teeth* yellow-brown staining; enamel hypoplasi *Blood*—anemia, thrombocytopenic purpur neutropenia, eosinophilia. *Liver*—cholestasis a high dosage.

Upon adverse reaction, stop medication an treat appropriately.

Lederle LEDERLE LABORATORIES, A Division of American Cyanamid Company, Pearl River, New York 10965

MAKE YOUR HOTEL ROOM RESERVATIONS NOW

for the

ANNUAL MEETING OF THE MEDICAL AND CHIRURGICAL FACULTY

APRIL 1, 2, 3, 1970

A block of rooms has been set aside at the BELVEDERE HOTEL, Baltimore, for those attending this meeting. Because of many activities in the city, rooms will be at a premium.

The rates are $19.00 for a double or twin bedded room for two persons; single occupancy rate is $15.00; and suites are $25, $30, and $40.00.

FOR YOUR HOTEL RESERVATION DETACH AND MAIL THIS SLIP DIRECTLY TO:

Mrs. Jacqueline Amati

ARTS AND HOBBY EXHIBIT

Annual Meeting of the Medical and Chirurgical Faculty

APRIL 1, 2, 3, 1970 The Alcazar, Baltimore

APPLICATION FOR ARTS AND HOBBY EXHIBIT

Fill in and mail to: Chairman, Arts and Hobby Exhibit
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore 21201

1. Title of exhibit: .....

.....

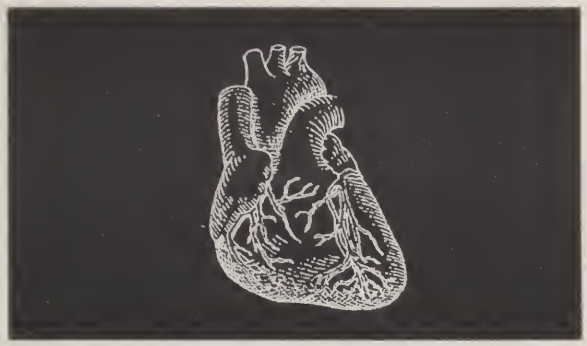
2. Amount of space required—depth, width, and height: .....

3. Electrical or other requirements: .....

4. Name of exhibitor: .....
Please print

5. Address of exhibitor: .....

6. Telephone number of exhibitor: .....



An Arts and Hobby Exhibit will be held during the 172nd Annual Meeting of the Medical and Chirurgical Faculty. Physicians, their wives and families are asked to help make this exhibit an outstanding one with many interests on display. Anything made by the exhibitor is eligible. Entries will be accepted until all exhibit space is allotted. Please have exhibits framed or mounted.

Entries should be delivered to The Alcazar, Cathedral and Madison Streets, Baltimore, between 9:00 AM and 4:30 PM on Tuesday, March 31. They must be removed on Friday, April 3, between 1:30 and 4:30 PM. The Faculty cannot carry insurance on your exhibit, but utmost care will be taken of it. There will be a watchman on duty when the meeting is not in session. Probably the exhibitors' personal policies will cover the exhibit.

Certificates will be awarded to the prize-winning exhibits. The names of exhibitors received by February 1, 1970, will be listed in the printed Annual Meeting program. However, all entries should be submitted as early as possible.

Committee for Arts and Hobby Exhibits:

Mrs. Charles H. Williams, *Chairman*
Mrs. George H. Yeager, *Chairman, Judging*
Mrs. Kurt Lederer
Mrs. Marvin I. Mones

The Master's Two-Step Exercise Tolerance Electrocardiographic Test: *Part I*

LUIS F. GONZALEZ, MD
Baltimore

Multiple studies have been conducted throughout the years in an attempt to correlate stress tests and myocardial reserve. The response to adrenalin, pitressin, and anoxemia have been described. A primary difficulty in several of these studies is the fact that invariably, modifications of the Master's test are what is actually compared to other stress tests. At times what is reported is the pulse rate, and the blood pressure determination prior to, immediately, and two minutes after the completion of an amount of exercise which may or may not be as recorded in Master's original tables. Other investigators have allowed the individuals being tested to perform the required number of steps (as described in Master's original tables) without any specific time limitation. As described by Master, a single exercise test is to be completed in 1½ minutes and a double exercise test in 3 minutes. Some require that the person being tested carry out as many steps as possible within the prescribed period of time, or to exhaustion. Still others insist that the person being tested carry certain amounts of weight during the exercise test. Also, a lack of uniformity has been noted in the type, height, and number of steps involved. At times, chairs are used in place of the steps described earlier.

In 1935 Dr. Arthur M. Master presented the results of 1,000 tests carried out on 210 men and 234 women who had been exercised over 9in. steps, a total of 1½ ft in height, over 1½ minutes in time. Blood pressure, pulse and respirations were measured. From the data collected and the individuals' weight, the work performed in ft—lbs per minute was calculated.

The formula used included the number of ascents multiplied by the individual's weight in lbs, multiplied by 1½ ft (height of the steps); all of these divided by 1½ minutes. The formula cancels the 1½ units; consequently, work per minute was described in reference to the number of ascents against the weight in lbs. It was found that the systolic blood pressure was the least stable of the factors evaluated, whereas the diastolic blood pressure was the most stable factor. It was eventually suggested that the blood pressure and the pulse rate must return to within 10 points of the base line values 2 minutes post exercise. Finally, Master considered that electrocardiographic changes following the exercise tests were of more practical value than blood pressure and pulse responses.

In 1944 Master published data suggesting that the electrocardiographic abnormalities noted subsequent to the performance of these exercise tests were due to lack of oxygen supply to the heart muscle, and that similar electrocardiographic abnormalities could be reproduced in the same individual by breathing 10% oxygen.

In 1950, Master defined the post-exercise electrocardiographic criteria which (in his opinion) best correlated with the presence of myocardial ischemia. He stated that an ST segment depression of 0.5 mm

or greater, the flattening or inversion of a previously upright T wave, or the production of an upright T wave from a previously flat or negative T (exception in lead 3), premature beats, arrhythmias, intraventricular conduction delays, bundle branch block, large Q waves, first degree heart block, and other types of heart block were considered abnormal responses to exercise.

He pointed out that a positive exercise test is not necessarily a sign of organic coronary disease and that coronary insufficiency may be functional, a point previously raised by Duchosal and Scherf. Nineteen years later, he stated that an abnormal response to an electrocardiographic stress test is no more than circumstantial evidence of the possible presence of silent coronary disease in asymptomatic individuals with normal resting EKGs.

Sokolow exercised his patients until a typical attack of pain occurred or until the patient became tired or dyspneic. An abnormal electrocardiographic response to exercise consisted of ST depression or elevation of 1 mm or more in lead 1; 1.25 mm or more in leads 2 or 3; and 2 mm or more in lead V4. An upright T wave becoming diphasic or inverted in leads 1, 2, or V4, or development of bundle branch block was considered abnormal.

Mattingly and Robb based their criteria on Paul Wood's definition of an ischemic ST segment—a flattened horizontal depression of the ST segment. Such an ischemic depression, greater than 0.5 mm is considered an abnormal response to exercise in the absence of hyperventilation, digitalis, or other drugs that cause electrocardiographic deformities.

A negative response to exercise consisted of no significant electrocardiographic changes, of transitory ST junction depression, or isolated T wave changes. Arrhythmias, conduction abnormalities, ST segment depressions less than 0.5 mm, and prolonged ST junction depression with flattening of the ST segment were considered of doubtful or no significance.

Katz' criteria include ST depression in two or more leads, 0.5 mm or more for limb leads, and 1.5 mm for chest leads; changes in the T waves in leads 1, 2, V4 or V5 becoming indiscernible, diphasic or inverted and the occurrence of ventricular extrasystoles, intraventricular conduction delay, or AV block. Katz has emphasized that delayed positive responses may be completely missed if the study is discontinued too early.

Several of the continuing controversies were brought to light in a series of letters to the Editors in the American Journal of Cardiology in 1964, subsequent to an article entitled "Evaluation Of Some Criteria For The Dynamic And Post-exercise Electrocardiogram In Diagnosing Coronary Insufficiency." These are rather instructive and should be read in detail.

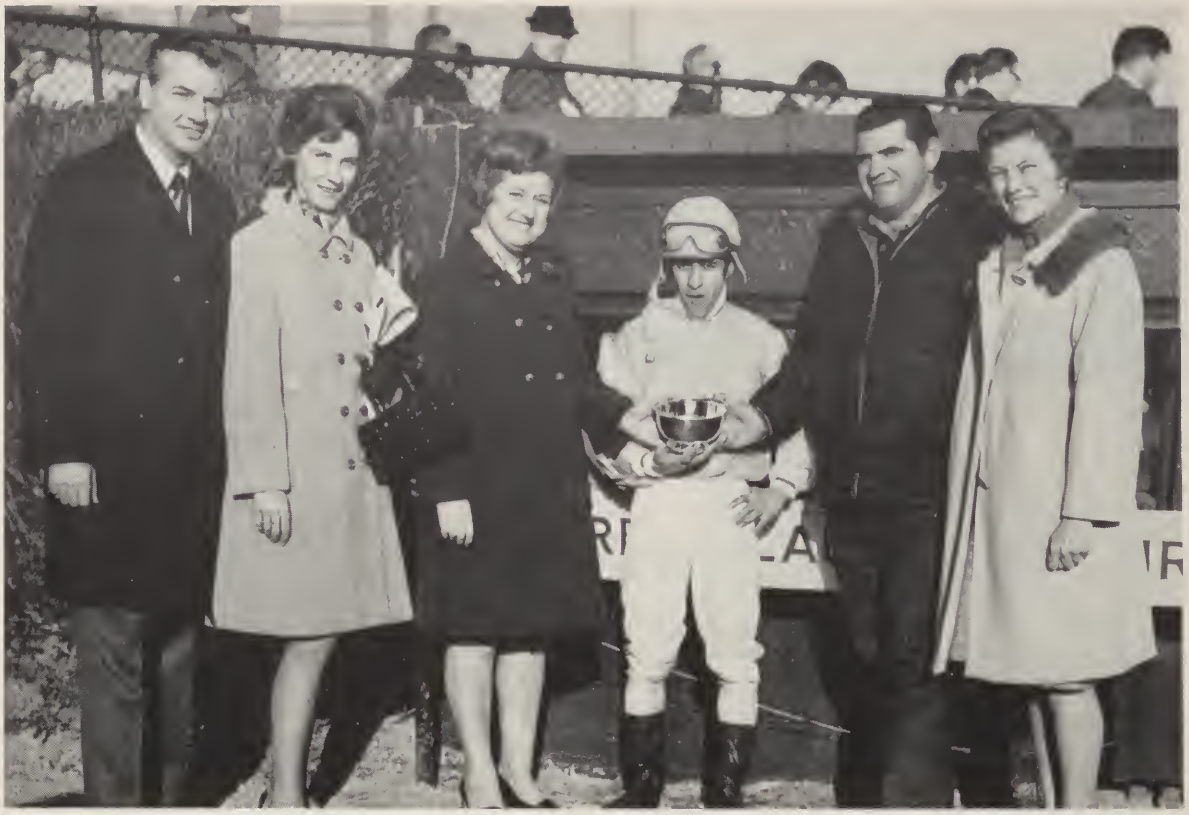
Woman's Auxiliary Goes To The Races For Fun(ds) For AMA-ERF

Undaunted by a change of date and somewhat inclement weather, supporters of the American Medical Association Education and Research Foundation gathered at Laurel Race Track on December 3, 1969.

Auxiliary members from Baltimore city, Baltimore County, Cecil County, Four-Counties, Harford County, Prince George's County, and Members-at-Large, their physician-husbands and guests enjoyed a tasty buffet luncheon in Laurel's famous Chesapeake Room with Art Brown of the Laurel staff as their host. Reserved seats in the clubhouse awaited the group who had come to the races in support of the project arranged by the Auxiliary's State Chairman, Mrs. Elmer Linhardt, to raise funds for medical education and research.



The sixth race was named for the Woman's Auxiliary and, in keeping with tradition, Mrs. Wallace H. Sadowsky, president, formally presented an engraved silver Revere bowl to Mr. and Mrs. Richard C. Smith, owners of "Twisty Clem", winner of the Medical and Chirurgical Faculty Woman's Auxiliary purse. Jockey José Castillo; Trainer Robert W. Anderson; and Mrs. Elmer G. Linhardt were also in the winner's circle to witness the presentation.

All proceeds derived from this project will be forwarded to the national AMA-ERF office and credited to the participating component auxiliaries.

Last year, physicians' wives throughout the nation raised a total of $428,875; the Maryland Auxiliary's contribution was $5,795.18. Under the conscientious leadership of Mrs. Linhardt, other projects of the Auxiliary to raise funds for AMA-ERF are the sale of Christmas cards, collection of S&H Green Stamp books, and sale of memorial, appreciation, congratulatory, and get-well cards.

Funds raised by the medical auxiliaries support two branches of the American Medical Association Education and Research Foundation. They are: (1) Funds for Medical Schools (unrestricted), and (2) Student Loan Fund. All funds raised go to the Foundation since the AMA absorbs the administrative costs. Funds for the medical schools help solve the financial problems facing every medical school dean in the country. In the past, this unrestricted money has been used by college deans to expand their faculties, increase faculty salaries, make building improvements, and purchase needed laboratory equipment and library books.

Funds designated for the Student Loan Program will enable many students to complete their medical education and will encourage others to enter medical schools. A medical student, intern, or resident may borrow a maximum of $1,500 in any 12-month period, $10,000 in a seven-year period, but may not exceed $15,000 total accumulated loans. Loan repayment may be spread over a ten-year period. Application blanks and pertinent details are available at each medical school and hospital administrator's office.

Photographed following the triumphant win by "Twisty Clem" at Laurel on December 3, 1969 were: (from left to right) **Mr. and Mrs. Richard C. Smith, proud-as-punch owners of "Twisty Clem"; Mrs. Wallace H. Sadowsky, president of the Woman's Auxiliary, who presented the trophy to the winner of the Medical and Chirurgical Faculty Woman's Auxiliary purse; jockey José Castillo; trainer Robert W. Anderson; and Mrs. Elmer G. Linhardt, the auxiliary's AMA-ERF State chairman.**

Professional Conferences

Since our last real communication in the JOURNAL this library has participated in several professional conferences in the region.

One special meeting at the National Library of Medicine involved preparations for the compilation of a union list of serials holdings in the major medical libraries of the Mid-Atlantic area, which includes states from Maryland to North Carolina. No specific action has been accomplished on this project to date.

Another meeting was the annual Regional Medical Library Association meeting in Bethesda, with the National Institutes of Health and National Library of Medicine as hosts. The program centered around the plans and accomplishments of the regional medical libraries in the U.S. News reports were given for Maryland by your librarian; from Virginia by Dr. Wilhelm Mohl of the University of Virginia Medical School Library; and by Mrs. Jean Jones, American Psychiatric Association Library, from the Washington area. Miss Hilda Moore, librarian from the University of Maryland Health Sciences Library, on behalf of her library, the Med/Chi Library and the medical libraries of the Baltimore metropolitan area, invited the group to meet with us in the fall of 1970—probably in October.

The national convention of the Medical Library Association, having postponed its spring meeting on account of the International Congress on Medical Librarianship in Amsterdam, met in Louisville late in October. Attendance there was very good. Baltimore was represented by 15 members. Meetings were generally well planned, particularly those set up by the Louisville librarians and the arrangements committees.

The Medical Society Group meeting proved one of the best group meetings, with Dr. Walter Hume, Jr., of Louisville, speaking as president of the Jefferson County (Ky.) Medical Society, and our own consultant, Mr. Lee Ash, speaking on his favorite subjects—rare book and history of medicine collections he has surveyed. Needless to say, our Med/Chi survey was prominent in his comments. As chairman, I was pleased that it proved to be a lively and interesting affair.

The last conference, in which a number of Baltimore librarians and at least one Med/Chi member figured, was the Tri-State meeting composed of Maryland, Delaware, and D.C. Hospital Associations representatives. For the second year, the Baltimore Hospital Librarians Association sponsored an all-day meeting for discussion of hospital related libraries and their function in the hospitals. Both meetings were very successful and attendance was good. Dr. Brannon T. Hubbard, member of the Medical Faculty of Maryland, was the speaker on services the hospital physicians and surgeons expect from their libraries. Other speakers were from the nursing organizations and other hospital fields.

Now we look forward to 1970 and the beginning of a new decade in medicine and the medical library profession.

Length of Hospitalization

More than 40% of the 11,997 patients admitted to Maryland's state-operated psychiatric hospitals during the 1968 fiscal year were discharged within one month after onset of hospitalization. Within half a year this figure reached nearly 70% with a major proportion of the remainder released from the hospital on long-term leave preparatory to ultimate discharge. The average period of hospitalization declined from six months in 1963 to six weeks in 1968. At the same time, the decrease in the proportion of geriatric admissions and the early release of most other patients produced a steady decline from 8.2 in 1948 to 2.9 in 1968 in the percentage dying in the hospital within the first six months after admission.

	YEAR ADMITTED			
	1968	1963	1958	1948
NUMBER ADMITTED	11,997	7,257	4,145	2,100
STATUS AFTER 6 MONTHS (%)				
DISCHARGED	69.4	50.0	30.2	14.6
LESS THAN 1 MONTH	41.0	21.6	11.1	7.8
1-5 MONTHS	28.4	28.4	19.1	6.8
DECEASED	2.9	4.8	6.0	8.2
UNDER HOSPITAL SUPERVISION *	27.7	45.2	63.8	77.2

*** In hospital and on long-term leave**

A number of factors relate to this continuing reduction in average length of hospitalization. Within the hospitals, rising employee-patient ratios, the current emphasis on drug therapy, other new treatment techniques and modalities have played an important role. In the community, a continuing increase in the number and variety of available supportive services has enabled hospitals to release patients earlier. At the same time, as illustrated by the following data, admissions are gradually shifting from those requiring extended services for chronic illnesses to those admitted for short-term intensive treatment of acute disturbances.

1. The proportion of voluntary admissions is increasing in each hospital and, to a lesser extent, among many diagnostic categories of patients. Last year, 36.8% of the 11,997 patients entering these facilities were self-admitted. This percentage was 31.1 of the 7,257 admitted in 1963.

2. The proportion of admissions with a diagnosis of schizophrenia or other psychotic disorders declined from 31.9% in 1963 to 17.3% in 1968. During the same time period, the proportion of all admissions for the treatment of alcoholism increased from 30.2% to 49.2%. Most alcoholics are released after a brief hospitalization.

3. The average age of admissions is decreasing in many diagnostic groups. Admissions now occur more frequently during earlier, more acute phases.

Latest available data indicate that admissions are at a record level and, if present trends continue, will rise 10% or more per year. Development of a coordinated program involving presently existing facilities and the expansion of community centered residential and outpatient services is essential to meet this rising need.

A once-popular treatment for back pains was to have the seventh son of a seventh son stand or walk on the patient's back.

The pain of earache was allegedly relieved by holding a hot roasted onion to the ear.

For headache, a sovereign remedy was to wear a snakeskin round one's head.

A realistic approach to pain relief

Empirin'®

Compound with Codeine Phosphate gr. 1/2 No. 3

Each tablet contains:
Codeine Phosphate gr. 1/2 (Warning—May be habit forming), Phenacetin gr. 2 1/2, Aspirin gr. 3 1/2, Caffeine gr. 1/2.

keeps the promise of pain relief

'B.W. & Co.' narcotic products are Class "B", and as such are available on oral prescription, where State law permits.

BURROUGHS WELLCOME & CO. (U.S.A.) INC.
Tuckahoe, N.Y.

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently. Large doses of the alka formulation are contraindicated in glaucoma.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Persistent or severe dyspepsia may indicate peptic ulcer; perform upper gastrointestinal x-ray diagnostic tests if drug is continued. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with caution in the first trimester of pregnancy and in patients with thyroid disease.

Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. Patients should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage occur. Make complete blood counts at weekly intervals during early therapy and at 2-week intervals thereafter. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

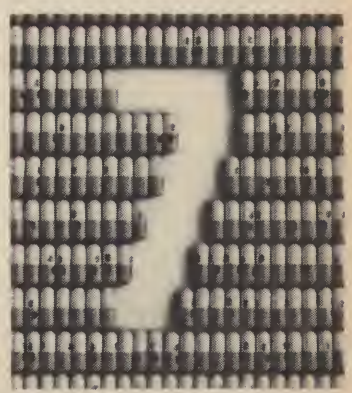
Adverse Reactions: The more common are nausea and edema. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. The patient should be instructed to take doses immediately before or after meals or with milk to minimize gastric upset. Drug rash occasionally occurs. If it does, promptly discontinue the drug. Agranulocytosis, exfoliative derma

Sandy sails again! After an arthritic flare-up.

His rheumatoid arthritis flared out of aspirin control. It meant weeks of pain, stiffness, swelling and tenderness...and a lot of sun and wind that somebody else took advantage of.

Next time, after aspirin, consider Butazolidin alka:
prompt anti-inflammatory effectiveness
short trial period
low maintenance dosage
usual dosage: 1 capsule q.i.d. initially, then 1 or 2 daily

Butazolidin® alka



100 mg. phenylbutazone
100 mg. dried aluminum hydroxide gel
150 mg. magnesium trisilicate

Serious side effects can occur. Select patients carefully (particularly the elderly) and follow them closely in line with the drug's precautions, warnings and contraindications. Read the prescribing information. It's summarized below.

...ti, Stevens-Johnson syndrome, ...Ll's syndrome (toxic necrotizing e...lermolysis), or a generalized a...rgic reaction similar to serum s...tness may occur and require p...manent withdrawal of medica...t... Agranulocytosis can occur s...denly in spite of regular, repeated n...mal white counts. Stomatitis a... rarely, salivary gland enlarge...m...t may require cessation of treat...m...t. Such patients should not re...ive subsequent courses of the d...g. Vomiting, vertigo and languor m... occur. Leukemia and leukemoid re...tions have been reported. While n...definitely attributable to the d..., a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, hypersensitivity angiitis, pericarditis and several cases of anuria, glomerulonephritis and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Rheumatoid Arthritis: Initial: 3 to 6 capsules daily in 3 or 4 equal doses. Trial period: 1 week. Maintenance dosage should not exceed 4 capsules daily; response is often achieved with 1 or 2 capsules daily. In selecting the appropriate dosage in any specific case, consideration should be given to the patient's weight, general health, age and any other factors influencing drug response. (B)46-070-C

If it doesn't work in a week, forget it.

symptoms of mixed anxiety-depression are rarely clear-cut..
but they are often a clear indication for

Mellaril®
(thioridazine)
25 mg. t.i.d.

effective in mixed anxiety-depression and in moderate to severe anxiety

Before prescribing or administering, see Sandoz literature for full product information, including adverse reactions reported with phenothiazines. The following is a brief precautionary statement.

Contraindications: Severe central nervous system depression, comatose states from any cause, hypertensive or hypotensive heart disease of extreme degree.

Warnings: Administer cautiously to patients who have previously exhibited a hypersensitivity reaction (e.g., blood dyscrasias, jaundice) to phenothiazines. Phenothiazines are capable of potentiating central nervous system depressants (e.g., anesthetics, opiates, alcohol, etc.) as well as atropine and phosphorus insecticides. During pregnancy, administer only when necessary.

Precautions: There have been infrequent reports of leukopenia and/or agranulocytosis and convulsive seizures. In epileptic patients, anticonvulsant medication should also be maintained. Pigmentary retinopathy may be avoided by remaining within the recommended limits of dosage. Administer cautiously to patients participating in activities requiring complete mental alertness (e.g., driving). Orthostatic hypotension is more common in females than in males. Do not use epinephrine in treating drug-induced hypotension. Daily doses in excess of 300 mg. should be used only in severe neuropsychiatric conditions.

Adverse Reactions: *Central Nervous System*—Drowsiness, especially with large doses, early in treatment; infrequently, pseudoparkinsonism and other extrapyramidal symptoms; nocturnal confusion, hyperactivity, lethargy, psychotic reactions, restlessness, and headache. *Autonomic Nervous System*—Dryness of mouth, blurred vision, constipation, nausea, vomiting, diarrhea, nasal stuffiness, and pallor. *Endocrine System*—Galactorrhea, breast engorgement, amenorrhea, inhibition of ejaculation, and peripheral edema. *Skin*—Dermatitis and skin eruptions of the urticarial type, photosensitivity. *Cardiovascular System*—Changes in the terminal portion of the electrocardiogram have been observed in some patients receiving the phenothiazine tranquilizers, including Mellaril (thioridazine). While there is no evidence at present that these changes are in any way precursors of any significant disturbance of cardiac rhythm, several sudden and unexpected deaths apparently due to cardiac arrest have occurred in patients previously showing electrocardiographic changes. The use of periodic electrocardiograms has been proposed but would appear to be of questionable value as a predictive device. *Other*—A single case described as parotid swelling.

Highlights

Medical Assistance—Changing Trends in Appeals for Fair Hearings

So much has been heard about the financial problems encountered with Medical Assistance that some attention to the human aspects of this experience seems well overdue. Small notice has been taken of the many individuals and families saved from despair and restored to healthy and independent living because needed medical care was provided. Likewise, there seems to be little awareness of the strain, stress, and hopelessness experienced by many who do not quite meet the program's restrictive and inflexible eligibility standards, yet cannot possibly afford the medical care which they need.

Title XIX of the Social Security Act requires that a fair hearing be granted to any individual who requests one because his claim for Medical Assistance is denied, or because he is aggrieved by any action of the agency which affects his receipt of Medical Assistance. The receiving of appeals and the conducting of the hearings gives, at least, a small view of the human problems. It is recognized that this view represents no more than a portion of the problem, and that the most discouraged individuals are the least likely to file an appeal.

Since the beginning of the Maryland Medical Assistance Program in 1966, the vast majority of appeals has been related to financial eligibility. Since most of the persons who are obliged to depend on public assistance for maintenance are automatically certified for Medical Assistance, those who appeal are the "medically indigent". Approximately half of the appellants have an earned income, while the other half live on old age, survivors, and disability benefits and small pensions or both. It has been observed that the position of those with fixed, marginal incomes, or seasonal employment is especially difficult.

A continuing problem for which no satisfactory solution has been found involves patients who live at home, but require continuous medical care on an outpatient basis. Many of these have incomes which are somewhat above the state eligibility scale, but are insufficient to pay for periodic visits to the physician's office or clinic, for laboratory tests as recommended, and for medications as prescribed. The incidence of chronic disease is high in this group, yet such patients avoid going to the physician when they cannot pay for the service; and similarly, they often leave prescriptions unfilled. We have known patients in this group to have such diagnosed conditions as emphysema, cardiovascular disease, diabetes (severe), rheumatoid arthritis, lupus erythematosus and hypertension. Sometimes the physicians treating the patients have provided notes indicating the severity of the disease. Too little medical information is available on these patients to make an accurate statistical study, but it seems that cases of this kind are increasing in number.

The past six months have shown a conspicuous new trend in the appeals which the State Department of Health receives. While those appeals related to financial eligibility are still in the majority, there is a rapid increase of appeals related to the level of nursing home care which will meet the patient's needs. Early in 1969, the federal policy for Medical Assistance tightened the requirements for standards of care to be met by "skilled nursing homes". At the same time, it clarified the definitions and guidelines for determining the level of care needed by individual patients. Medical Assistance coverage is available when care is given in a "skilled nursing home" facility and only for patients certified to receive that level of care.

An increasing number of appeals now are on behalf of patients who are considered by their families to need skilled nursing care but, according to a careful review and assessment made by the local health department medical authority, need care at an intermediate level instead. These situations pose several problems for the patients, their families, and for the

local health department as well. In many instances, the patients are already in skilled nursing homes, but no longer need the full day's care given by professional nurses. Typically, the family is reluctant to have the patient moved because they question the patient's ability to adapt to another change. In addition, they fear that the lower level of care will not be adequate. An additional factor is that Medical Assistance cannot pay for the intermediate levels of care. The more stringent means test for public assistance under the Department of Social Services cannot always be met by the patient and family, thus leaving no source of help in financing the care. It has become apparent that a number of adults, often with families of their own, gave devoted care and financial support to a parent at home before that parent required admission to an institution. However, they cannot meet today's cost of the institutional care for an indefinite period without drastically limiting their own scale of living and educational or other plans for their children.

At this stage of experience with the Medical Assistance Program, it is possible to identify some of the gaps and other problems as they affect the individuals and families who have medical problems requiring care which they cannot always afford or obtain. Fortunately, some progress is being made. Some well-qualified nursing homes are establishing areas within their institutions which provide higher level (Intermediate A) nursing care for such patients. This avoids moving many patients; but for those who are not eligible for public assistance, the financial problem still exists. The number of beds for intermediate care is still small when compared to the large and growing need for such nursing facilities. It is hoped that some solution can be found for those patients at home whose need for medical care cannot be met either by themselves or by Medical Assistance. Many of these represent a high risk group with a considerable potential for hospitalization, since they do not get the care which could prevent hospitalization.

Diphtheria, Tetanus, and Pertussis Vaccine

Routine immunization to prevent diphtheria, tetanus, and pertussis has been widely practiced in the United States for the past 20 years and has resulted in a marked decline in the incidence of these diseases. However, small outbreaks of diphtheria associated with high mortality rates continue to appear in inadequately immunized individuals of all ages. Tetanus is also an important health problem. Since the organism can be found anywhere, there is a need for every person to receive primary immunization and periodic booster doses. Pertussis, on the other hand, is primarily a disease of infancy and thus requires immunization with diphtheria and tetanus toxoids and pertussis vaccine (DTP) early in life.

The preparations used for immunization against diphtheria, tetanus, and pertussis are as follows:

1) Diphtheria and tetanus toxoids and pertussis vaccine (DTP), used *only* for children under seven years of age.
2) Tetanus and diphtheria toxoids, *adult type* (Td). This is the agent of choice for immunization of individuals seven years old and older.
3) Tetanus toxoid (T).

The Medical and Chirurgical Faculty of Maryland concurs with the following recommendations of the Maryland State Department of Health for immunization against diphtheria, tetanus, and pertussis.

I. Primary Immunization

A. Children two months through six years of age:
DTP—(Start at two months or as soon thereafter as possible). Three injections at four to six week intervals with a reinforcing dose about one year after the third dose.

B. Adults and children seven years of age and older:
Td (adult type)—two injections at four to six week intervals with a reinforcing dose one year after the second dose.

II. Booster Immunization

A. Children younger than seven years:
DTP—one dose given between three and six years of age.

B. Individuals seven years old and older:
Td—one dose every ten years (see below for wound management).

III. Tetanus Prophylaxis in Wound Management

Tetanus prevention is important in the treatment of wounds. An adequate history of tetanus immunization should be obtained, and toxoid should be administered according to the nature of the wound and the patient's history. In general, if a person has a wound and

A. If the patient has completed his primary series with three or more shots of tetanus toxoid, Td, or DTP and has had a booster dose less than one year prior to the injury, no additional boosters are necessary.

B. If, however, more than one year has passed since the last shot and the patient has received a complete primary series, then a single dose of Td should be given. (*Only if there is reason to suspect hypersensitivity to the diphtheria component should one substitute tetanus toxoid (T) for Td, adult type.)*

C. If an individual has received incomplete primary immunization, then complete primary immunization as recommended above.

D. If the patient has no history of primary immunization, the decision to use passive immunization will be based on the type and severity of the wound, the extent of contamination, and the time elapsed between injury and medical attention. Passive immunization consists of a single dose (250 units) of Tetanus Immune Globulin (*human*). This is the antitoxin of preference and is far superior to the old type horse serum antitoxin as it has the advantage of longer protection and freedom from severe anaphylactic reaction. When Tetanus Immune Globulin is unavailable, it may be necessary to use the horse or bovine antitoxin. Before either of these animal sera are used, the patient must be carefully tested for serum sensitivity. At the time the tetanus antitoxin dose is given, an initial dose of Td should be administered at a different site and in a separate syringe. The primary series of Td should then be completed.

Lung Cancer in Women

In comparing the characteristics of lung cancer in men and women, it was found that although the condition is rarer in women than in men, in women it is less frequently resectable at the time of diagnosis and the prognosis is therefore less favorable.

In an effort to understand the differences in lung cancer in men and women, a study was made of clinical, histological, and biological features of tumors in 83 women as compared with 1,353 lung cancers in men, a ratio of men to women of 16:1. The study covered a 15-year period and was carried out at Morriston Hospital, Swansea, Wales.

Histology

Tissue for histological examination was obtained from 56 patients by bronchial biopsy or open operation. Five types of lung cancer were recognized. They were classified as squamous carcinoma, well and poorly differentiated; adenocarcinoma, well and poorly differentiated; and undifferentiated carcinoma. Thirteen of the tumors were squamous cell; 16 glandular; and 27 undifferentiated.

In comparison with some other surveys, the proportion of squamous-type tumors in this series was significantly low and the incidence of glandular and undifferentiated carcinomas was high. The relatively small number of cases of squamous-celled carcinoma may be attributed to the lower frequency of chronic irritation in the bronchi of women than in men, whether due to cigarette smoking or to chronic bronchial inflammation in the latter.

At the time the cancer was diagnosed, the mean age of the women was 56 years, approximately two years lower than that of the men who sought medical advice for a cough. The mean age of men whose cancer was diagnosed as a result of a routine chest X-ray was 61 years. The younger age at diagnosis in women than in men is somewhat surprising since there are more women than men in the older age groups. Since the incidence of lung cancer increases with age, a relatively higher average might be expected in women than in men.

However, a greater proportion of ill-differentiated cancers are found in women than in men. These lesions tend to occur at an earlier age than the differentiated type, thus the age difference may be due to such a factor. Or, the frequency of lung cancer in younger women may be linked to the fact that cigarette smoking is more common in younger than in older women.

Symptoms

Cough, dyspnea, chest pain, and hemoptysis are the principal symptoms of lung cancer. In the series reported, cough was the major symptom at the time of diagnosis in the greatest number of women and men; men complained of dyspnea more frequently than women; chest pain was a common symptom in about the same percentage of men and women. Hemoptysis was more common in men than in women.

Shortness of breath in patients with lung cancer is often the result of a relatively small decrease in respiratory capacity in a person who has respiratory impairment due to chronic bronchitis or emphysema. Since such conditions are less common in women than in men, the lower prevalence of dyspnea in women may be related to the women's general respiratory health.

Metastases

Extrathoracic metastases were detectable at the time of diagnosis in a significant number of women; 18 of the 56 patients in whom histological confirmation of diagnosis was available had extrathoracic secondary deposits.

David J. B. Ashley, MD, and H. Duncan Davies, MD. *Thorax,* July, 1969 (Vol. 24, No. 4).

Lesions were resected in 11 patients, a lower proportion than in the series of men, 13.4% in contrast to 21%.

Of 56 women whose smoking history was available, 23 (41%) were nonsmokers. The mean age of the smokers was 55 years, slightly lower than that of the nonsmokers, which was 57 years. No significant differences were observed in the distribution of histological types of tumors among smokers and nonsmokers.

On the basis of the data obtained, it appears that lung cancer is less common in women than in men, is less likely to be of the squamous-celled type, and is more likely to be of the glandular type or to be undifferentiated. The degree of differentiation is less in women than in men. Lung cancer is likely to occur at an earlier age in women, and extrathoracic metastases are likely to have taken place when symptoms appear. The prognosis of lung cancer in women is worse than in men.

The difference in resectability of lung cancer in men and women cannot be explained on the basis of the histological type of tumor or on the anatomical localization in the bronchial tree, nor can the higher proportion of women patients in this series in whom extrathoracic metastases were present at the time of diagnosis be explained on the basis of the histological type of lesion. An alternative hypothesis is suggested.

Hypothesis

At least one of the genes in the immunological defense mechanism of the body is carried in the X chromosome; mutation at this locus leads to the clinical condition of agammaglobulinemia in which there is a deficiency of a circulating immunoglobulin and also a deficiency of plasma-cell reaction to foreign antigens. With their double complement of X chromosome, women have a lower frequency of agammaglobulinemia and, by inference, a better immunological capacity.

It is suggested that those tumors of the lung which become clinically apparent are the ones in which the multiplying neoplastic cells are able to overcome the immunological defenses of the body which would otherwise treat them as foreign cells and destroy them. In women, with a better defense mechanism, fewer tumors would overcome the defenses, but those which did would be intrinsically more malignant and less amenable to therapy.

This hypothesis would account for the lower proportion of lung cancers in women, which cannot be completely explained by the lower proportion of women who are cigarette smokers. It would account for the reduced frequency with which the tumors are resectable, for the higher proportion of neoplasms of histologically undifferentiated type, and for the generally poorer prognosis in lung cancer in women.

ROBERT E. FARBER, MD, MPH, COMMISSIONER

Baltimore City
health department

The Reverend Hanna Appointed Coordinator for Drug Abuse Programs

The Reverend Frederick J. Hanna has been appointed Coordinator for Drug Abuse Programs in the Baltimore City Health Department. This new and much needed City Health Department post, authorized by the City Civil Service Commission and the Board of Estimates with the approval of the Mayor, should greatly aid in the city's attack on the problems of drug abuse and the drug abuser.

Mr. Hanna, Chairman of the Baltimore Commission to Study Drug Addiction, has been close to Baltimore's drug and social problems for many years, not only as Minister of Social Services of Emmanuel Church, but also as the former Director of the church's Crisis Center, an experimental ministry supported by 11 downtown churches, which provides direct assistance to city residents when community resources are lacking. As Director of the Center, Mr. Hanna has devoted much time to the study of drug abuse among young people and has dealt with many individuals who are either addicted to drugs or are abusing them.

As Coordinator for Drug Abuse Programs in the City Health Department, Mr. Hanna will continue his efforts to develop community awareness of the extent of the drug abuse problem and encourage the development and expansion of comprehensive educational programs. Moreover, Mr. Hanna will coordinate and promote treatment and rehabilitation programs for drug abusers in the city, develop in-service training programs for professionals, and seek to prevent emotionally disturbed young people from turning to drugs.

According to Mr. Hanna, there is a "tremendous need for straight information about drugs and for honest facts." Mr. Hanna believes that if we do give information in a straightforward way and "level" with our young people, the great majority will make the right decision.

Recognizing the need for scientific research and additional programs for treatment and post-treatment care, Mr. Hanna feels that the greatest emphasis should be placed on finding effective ways to prevent the drug problem through strengthening the individual, his family, and the educational curriculum.

Born in Baltimore, Mr. Hanna attended the public schools of the city and received the BS degree from The Johns Hopkins University. Following attendance at Bexley Hall Divinity School of Kenyon College in Ohio, he was ordained deacon in 1956 and priest in 1957. He has been Vicar of the Chapel of the Redemption at Locust Point in Baltimore, Assistant Rector of Emmanuel Church, and currently serves as an Associate on the staff of Emmanuel.

During 1963 and 1964, Mr. Hanna attended St. Augustine's College in Canterbury, England, where he studied social services and church-state relationships and prepared a thesis on the "Role of the Church in Urbanized Society." His visit not only enabled him to meet with city planners, social scientists, and community workers, but also permitted him to do special work in the areas of drug abuse and homosexuality.

Mr. Hanna is a member of the Baltimore City Community Relations Commission, is Secretary-Treasurer of the Board of Metropolitan Strategy and Christian Social Relations, and serves on the boards of many community agencies including the Baltimore Area Council on Alcoholism, the Pilot House, the Prisoners Aid Association of Maryland, and the Metropolitan Senior Citizens Center.

Physicians who have patients with drug addiction problems may call Mr. Hanna at 837-2710, extension 31. Mr. Hanna's office is in the Western Health District Building, 700 W. Lombard Street.

Amendment to Vital Records Regulations

An amendment to Regulation 43M01 governing Vital Records was approved by the Attorney General and subsequently adopted by the Secretary of Health and Mental Hygiene on October 31, 1969. This amendment relating to the registration of Fetal Deaths in Maryland became effective January 1, 1970 and reads as follows: *030102 If the gestation period is unknown but the fetus weighs 500 grams or more a fetal death certificate must be filed.*

The amendment changes the previous requirement that if the period of gestation is unknown and the fetus weighs 400 or more grams a fetal death certificate must be filed. As of January 1, 1970 the requirement for registering a fetal death is:

A CERTIFICATE OF FETAL DEATH MUST BE EXECUTED WITHIN 24 HOURS FOR EVERY FETUS DEAD AT BIRTH IF THE PERIOD OF GESTATION IS 20 OR MORE WEEKS, OR IF THE PERIOD OF GESTATION IS UNKNOWN AND THE FETUS WEIGHS 500 OR MORE GRAMS.

The concert was just underway,
When to the conductor's dismay
Cramps and diarrhea,
Did so quickly appear,
The maestro no longer could stay.

Because diarrhea with cramping, nausea, and painful straining can re at the most inopportune time, it takes a comprehensive agent to treat the ot diarrheal syndrome and help get the patient back on the job. That's why many physicians rely on Donnagel, especially during the fall and winter nths when "flu" and viral gastroenteritis usually hit their peak.

Donnagel is much more than just a simple kaolin-pectin combination. so contains the belladonna alkaloids to calm GI hypermotility and help elve the distressing discomforts which so often accompany diarrhea. Certainly 's ess expensive and more convenient than taking two medications. And the oge is lower too. Available in the handy 4-oz. plastic bottle at pharmacies verywhere on your prescription or recommendation.

o Diarrhea and its Discomforts

Donnagel®

ad fluid ounce contains: Kaolin, 6 Gm.; Pectin, 142.8 mg.; Hyoscyamine sulfate, .1 7 mg.; Atropine sulfate, 0.0194 mg.; Hyoscine hydrobromide, 0.0065 mg.; odium benzoate (preservative), 60 mg.; Alcohol, 3.8%.

Contraindications: Hypersensitivity to tetracycline.
Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.
Precautions: Nonsusceptible organisms may overgrow; treat superinfection appropriately. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).
Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity reactions*—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage. Upon adverse reaction, stop medication and treat appropriately.

Nursing Care for the Alcoholic

ELLEN A. ANDRUZZI, RN
Chief, Mental Health Nursing
District of Columbia Department of Public Health
Washington, D.C.

From the behavioral point of view, an alcoholic—that person whose drinking seriously interferes with his health, interpersonal relationships, and occupational status—is an extremely dependent person with great oral needs. Some of us satisfy such needs by smoking; others by overeating. Nurses are nurturing persons with strong parental impulses. They can be very helpful to an alcoholic if they understand what to do and how to do it.

Eric Berne defines alcoholism as a game, one of those "games people play." The players are: It, Persecutor, Patsy, Connection, and Rescuer. Each player perpetuates the game. The alcoholic is It and the nurse can play any of the other roles, if she is not careful. Instead of playing a role, the nurse can respond with firm, matter-of-fact parenting. The nurse who is alert and consistent in her treatment of the patient can avoid being manipulated. If the nurse's only visible function is to administer medication, she is the Connection. If she is the staff member who reacts with hostility and punishment to the patient's provocative behavior, she is the Persecutor. If she is the one who always exhibits great faith in the patient's expressed intention to reform and couldn't possibly believe he is drinking in the hospital, she's a Patsy. If she commiserates with the patient because "no one understands" him, makes personal sacrifices to get cigarettes for him, and generally defends him against Persecutors, she is a Rescuer. Let us examine the types of situations where you might have alcoholics as patients.

How many of you work in places which admit persons who are acutely intoxicated? They may be admitted with a diagnosis other than alcoholism because the hospital has a policy not to admit alcoholics. Alcohol oxidizes and is excreted in 24 to 72 hours, depending on such factors as the amount of alcohol ingested, and the size and physical condition of the person. Ordinarily, a safe, clean environment in which the patient can "sleep it off" will suffice. Some physicians will order a tranquilizer or a mild sedative. When the patient is able to tolerate food, he needs a high-caloric, high-vitamin diet. This may require some firm, good natured encouragement by the nurse.

The alcoholic with acute psychosis (either delirium tremens or alcoholic hallucinosis) is a medical-mental health emergency. As with the person who is acutely intoxicated, the nurse must be alert for the signs and symptoms of injury and complications. Fractures and lacerations are the most frequently noted injuries. Skull fractures can result in soft tissue damage, so the nurse must watch for the signs of increased intracranial pressure—a strong bounding pulse, increased blood pressure, and increased temperature. Esophageal varices, one of the complications of Laennec's cirrhosis, can rupture and lead to a fatal hemorrhage. Lobar pneumonia is another serious complication. A patient suffering from delirium tremens and alcoholic

Presented at the Symposium on Alcoholism for Nurses, held at the Richmond Academy of Medicine, Richmond, Virginia, on April 10, 1969.

hallucinosis is frequently extremely frightened. In DTs, the patient has visual hallucinations of insects, and small or oddly colored animals or both. The patient with hallucinosis has auditory hallucinations, usually accusatory or disparaging. He responds defensively and angrily. As the diagnostic name implies, a patient with DTs has uncontrollable tremors.

Nursing care involves carrying out medical orders for giving mild tranquilizers and for improving nutrition. Vital signs are taken frequently and the intake of fluids is encouraged. If the history and physical examination of the patient reveal coexisting conditions, the nurse provides the appropriate care. The nurse on the medical-surgical unit may have a patient who has been admitted for an acute febrile illness or for surgery following an injury, who goes into DTs. If the syndrome is not recognized and adequately treated, results can be serious and even fatal.

In all settings, the alcoholic patient needs a nurse who is as understanding and nonpunitive toward him as she would be toward a nonalcoholic patient. The nurse must promote the patient's safety and reassure him as often as needed. If the patient has reached the point where he is oriented and less confused, the nurse must support and encourage him as he gives up his relatively satisfying rationalizations and his use of alcohol as an escape from pain, and strives to learn new ways to cope with problems. If the facility has an active treatment program, the nurse participates actively on the treatment team. She screens and admits the patient, participates in the diagnostic, treatment, and planning conference, and then may have him in a therapy group. The nurse may also participate in family therapy and counseling. The nurse may encourage the patient to attend Alcoholics Anonymous meetings held in the facility, as well as make sure that he attends scheduled sessions of occupational therapy, manual arts therapy, work therapy, and vocational training. If the patient needs help with shelter and income, the nurse makes sure the patient keeps appointments with the social worker who can assist him. If the facility has no treatment program, the nurse encourages the patient to accept a referral to an outpatient clinic or asks a member of AA to talk with him about participating in that organization.

The patient in such Alcohol Rehabilitation Centers may have been in the custody of the sheriff, local police, or a state hospital before admission. In a few areas, he will have been in a Detoxification Center for one to five days before he is admitted to the Rehabilitation Center. Depending on his prior experience, he is restless, irritable, shaky, and demanding. He may have slept poorly or not at all for several days. When drinking, he has no desire for food, so he may not have eaten a full meal for several days. He is in a state of emotional turmoil. Again, the nurse is alert for physical complications and coexisting conditions. The patient may have pulmonary tuberculosis, and may require periodic chest X-rays. After many years of drinking, the patient may have peripheral neuritis. The nurse exploits the time spent dressing lacerations, burns, and other lesions to establish a healthy relationship with the patient. She meets his suspicions and hostility with attentive listening and brief, clear explanations of policies and procedures and their value to him. She avoids angry retorts and punitive methods so as not to be cast as Persecutor. She communicates freely with members of the nursing and health teams and does all she can to promote consistency in staff response. This kind of positive action helps the nurse avoid playing the roles of Patsy, Connection, and Rescuer. The nurse must be sure that the alcoholic receives the medication and treatment that he needs, and does not talk her into giving him medications that are not essential. She recognizes that he volunteers as a Helper and seeks to take on a pseudo-staff identity in order to exploit the staff as Connections. There is a fine line between his legitimate participation in work therapy or a work release program and his role as exploitative Helper. The nurse must be sure that the former occurs.

In the Rehabilitation Center, selected patients can make up educational deficits, learn a trade, improve known skills, learn manual arts and craft work, or be assigned to a job that produces some income while they are under treatment. The nurse contributes to the health and social skills content of formal classes. She also makes sure that the patient attends other classes or gets to a job regularly, or both. Nurses use the therapeutic community to give the patient an experience in developing a sense of responsibility toward other patients and to enhance his own self-respect. With this type of approach, the patient develops the rules and limits and is responsible for enforcing them. Such patients also divide daily living responsibilities among themselves and select or elect fellow patients to do the necessary follow-through. The therapeutic community gives the dependent alcoholic an opportunity to practice taking care of himself and others. It strengthens his ability to function effectively in the larger community.

As the supervisor at the D. C. Rehabilitation Center for Alcoholics, Mary Herring says, "Nurses working with alcoholic patients should establish realistic goals for themselves and the patients. To maintain sobriety for a period of weeks or months instead of days is an accomplishment even though patients drink again and again. To be able to re-establish a comfortable nurse-patient relationship with a man who feels guilty about drinking episodes requires patience, sometimes more than we have, but a necessary virtue in the rehabilitation of alcoholics."

Many nurses have, or can develop the necessary knowledge and skills to give adequate therapeutic care to the alcoholic patient. In many settings, these nurses may well be the primary mental health workers for this group of patients. It is our choice!

DOUGLAS G. CARROLL, MD, EDITOR

rehabilitation notes

Orthopedic Aspects of Spinal Cord Injuries

GERHARD SCHMEISSER, JR, MD
Associate Professor of Orthopedic Surgery
The Johns Hopkins University School of Medicine
The University of Maryland School of Medicine
Associate Chief of Surgery
Baltimore City Hospitals

The early treatment of spinal cord injuries should be influenced by the following factors. Neurological deficit from transection of the spinal cord is irreversible. Injury to the spinal cord and nerve roots is usually caused by impingement on components of the vertebral column. Persistent or repetitive impingement may aggravate the injury and increase the permanent neurological loss. Prevention of this additional loss is the primary objective of treatment. The only method of preventing this additional loss is by relieving persisting impingement and preventing re-impingement. This can be done by repositioning or removing portions of the vertebral column (decompression) and immobilizing the injured area (stabilization).

Initial Care

Impingement may be due to different types of disruptions of the vertebral column and its associated structures (Fig. 1). These include extrusion of the nucleus pulposus, infolded edges of torn ligaments, dislocations, and displaced vertebral fragments. Depending on the nature of the impingement, its relief might be accomplished by any of various methods of posturing, traction, or surgical decompression. A good treatment choice cannot be made until the exact location and cause of the impingement are identified.

In the meantime, a neutral position of the vertebral column is the position most likely to relieve pressure. For this purpose and to facilitate emergency therapeutic measures such as airway suction, cardiopulmonary resuscitation or tracheostomy, the patient should be placed on his back as soon as possible.[1] If pain, paralysis, or sensory loss indicate that the injury is cervical, light isotonic traction will facilitate stabilization. However, isotonic traction is possible only after the patient has been placed on a hospital stretcher. Unfortunately, if traction appliances are used on the patient while he is in a moving ambulance, force levels on the cervical spine are likely to vary widely. Manual stabilization of the patient's head by an alert attendant, without any attempt at traction, is probably the safest possible immobilization technique during transportation.

After arrival at a hospital and until definitive care is rendered, special systems to maintain immobilization of the neck are possible and are justified. Repeated transfer of a patient from one surface to another is hazardous and entirely unnecessary if proper equipment is available and forethought is used. A portable lightweight X-ray penetrable lifter to which a traction system can be attached should be used (Fig. 2).[2] When an accident victim arrives in a hospital, he should be moved directly from the ambulance stretcher onto such a lifter, and traction should be applied immediately. The lifter can be shifted from one stretcher to another or to an X-ray

or operating table without disturbing either the patient or his traction. With a lifter, the patient can easily be placed on a turning frame such as the Stryker. After the anterior portion of the Stryker frame has been fastened down, the frame, with the patient clamped inside against the lifter, can be rotated to the prone position. The posterior portion of the Stryker frame is then unfastened and the lifter is removed. With this technique the patient can be positioned face down for myelography or laminectomy with minimum risk of altering spine posture or traction force. If surgery is necessary, a comfortable operating height can be obtained by lifting all four wheels of the frame onto footstools. With this technique either an anterior or posterior surgical approach to the cervical spine can be made with much less risk of irritating the spinal cord than if the patient is transferred to an operating table.

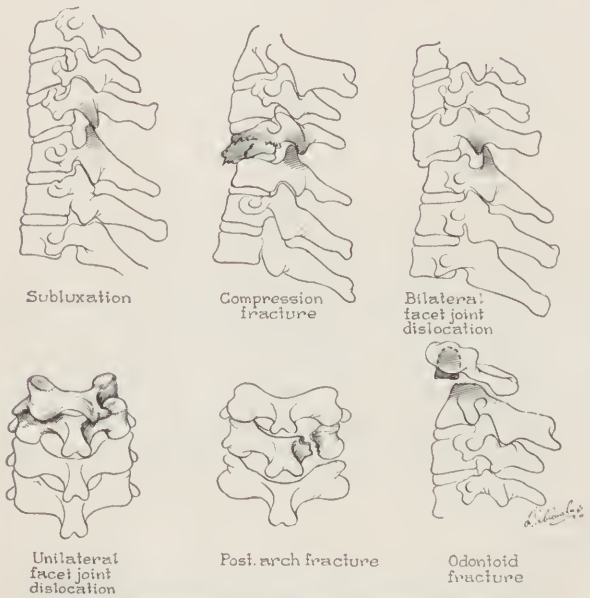

Fig. 1: Disruptions of the vertebral column.

Fig. 2: Cervical traction system can be attached directly to a portable X-ray penetrable lifter. Movements of the patient for X-rays or surgery are minimized.

Decompression

The patient's neurological status and the cause of the cord compression, as revealed by conventional and special X-ray studies such as myelography and laminography, determine which of several methods of decompression and stabilization will be most effective and least hazardous. The age of the patient, his normal activities and other aspects of his general health also influence the choice of treatment. The following possibilities exist:

1. Impingement no longer exists, therefore decompression is not indicated.
2. Impingement no longer exists but the spinal cord will swell until impingement recurs; therefore, prophylactic surgical decompression is indicated.
3. Impingement exists which can be relieved by adjustment of traction.
4. Impingement exists anteriorly which can be relieved by vertebral corpectomy (Fig. 3).
5. Impingement exists anteriorly which can be relieved by vertebral laminectomy. (Although this practice is widespread, the author believes that regardless of denticulatotomy, the restraining effect of the nerve roots and delicacy of the spinal cord prevent adequate mobilization of the cord for this method to be effective.)
6. Impingement exists posteriorly which can be relieved by vertebral laminectomy (Fig. 4 A & B).
7. Impingement exists both anteriorly and posteriorly which can be relieved by combined corpectomy and laminectomy (Fig. 4 C).

Stabilization

Definitive stabilization is accomplished by intrinsic, external, and operative methods. Immediately following vertebral or cord injury, some degree of temporary intrinsic stability is provided by spasm of adjacent para-vertebral muscles. Tightening of the trapezii draws up both shoulders. This protective reflex splints the injured neck. It may also complicate X-ray visualization of C7 and T1 . In view of a high frequency of injury in this area, adequate visualization is essential. Caudal traction on both upper limbs, or caudal traction on one limb and cephalic positioning of the other, "Swimmer's Position", may be necessary to obtain satisfactory lateral views.

External Techniques

Either temporary or definitive stabilization can be achieved by a wide variety of external techniques. Immobilization with head halter traction is a reasonable temporary precaution for any patient with a neck injury, but as soon as the diagnosis of either a spinal cord injury or an unstable vertebral column is established, skeletal traction with skull tongs should usually

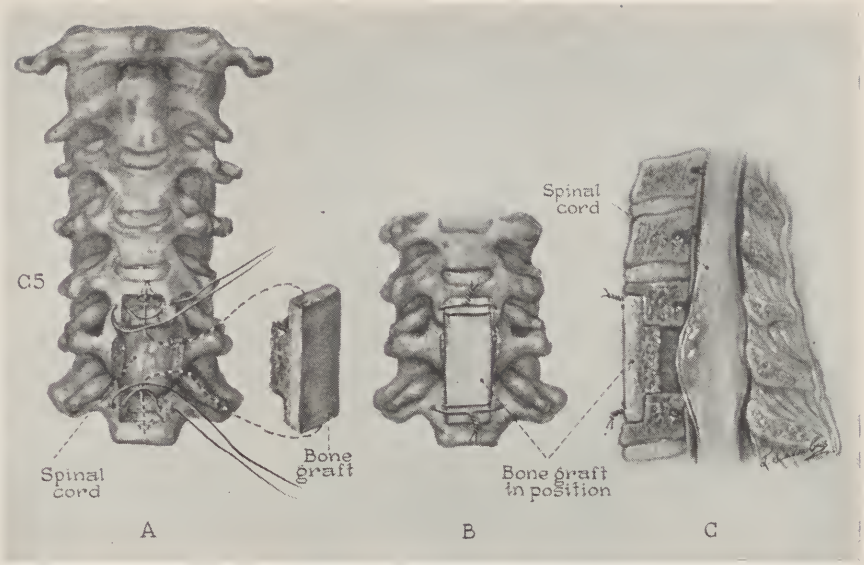

Fig. 3: Vertebral corpectomy and interbody strut fusion.

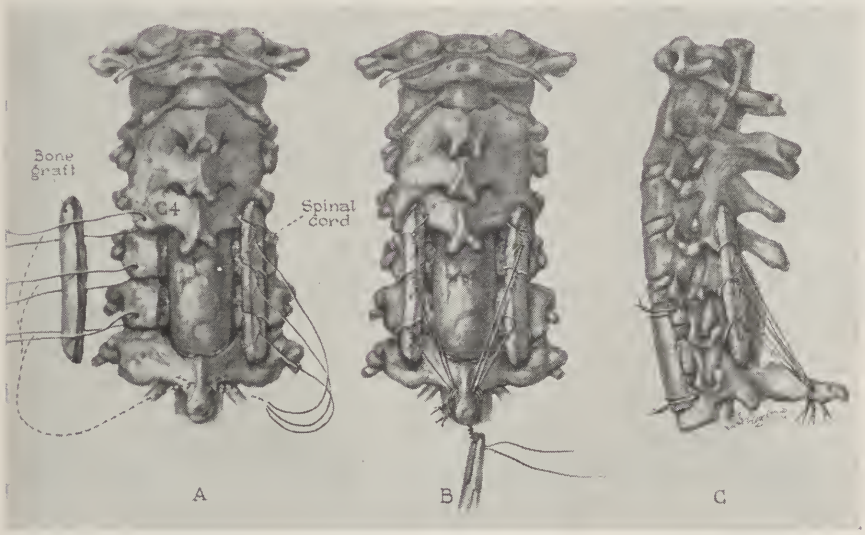

Fig. 4: Vertebral laminectomy and bilateral strut fusion with check reins. Lateral view, C, shows corpectomy and interbody fusion in association with the laminectomy and posterior fusion.

be applied.[3] A disadvantage of sustained head halter traction is that the skin over the mandible cannot indefinitely tolerate a constant compression force exceeding five pounds. Skeletal traction permits application of substantially higher forces. Forces high enough to reduce some fractures and dislocations can be used. However, the patient's neurological status should be monitored very carefully during such attempts. Traction loads in excess of 35 lbs are especially likely to increase neurological deficit.

A lateral turning device such as the Stryker Wedge Frame is always indicated for any patient in skeletal traction. The cephalic end of the frame should be elevated in proportion to the magnitude of the traction force. Although skeletal traction on a turning frame is easily adjusted and provides unobstructed access to the patient for surgery and nursing care, prolonged recumbency handicaps rehabilitation efforts and is demoralizing for the patient. Furthermore, skull tongs usually penetrate the inner table of the skull or disengage within several weeks. If more prolonged immobilization is required, the Rancho Los Amigos Halo apparatus is an alternative which has the advantage of permitting the patient to sit up and move about (Fig. 5).[4] The skull is held by four pins passing through a steel ring which is fastened by steel rods to a snug body jacket. The body jacket is carefully molded to grip the pelvis. A Minerva plaster cast, which encases the head and trunk, is another alternative, but it is less comfortable and does not stabilize the spine as securely as the Halo. Due to shoulder mobility, shoulder-based braces and cervical collars provide only slight immobilization. They shift about when the patient lies down and usually impinge on the throat when the patient is in a prone position. They are useful primarily when patients are sitting or walking and only if minimum support is needed.

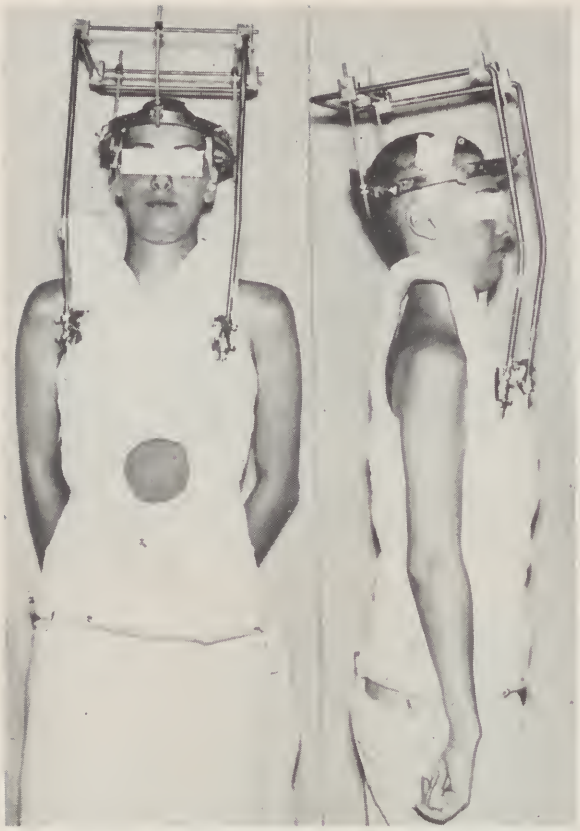

Fig. 5: The Rancho Los Amigos Halo apparatus provides secure immobilization of the cervical spine but permits sitting and ambulation.

Internal Techniques

Surgical methods of stabilization include many types of spine fusions. These may be classified into anterior and posterior types. If a fusion is justified, the type performed may be determined by the procedure selected to decompress the cord and realign the vertebral column. If anterior decompression by anterior discectomy or corpectomy is performed, a bone plug is placed between the portions of the vertebral bodies remaining above and below the surgical defect (Fig. 3). If fusion is performed posteriorly and the spinous processes and laminae were not fractured or surgically removed, the spinous processes can be fastened together with wire and bone grafts. On the other hand, if a cervical laminectomy has been performed, fusion must be performed between remaining portions of the articular processes of the facet joints. A satisfactory method is to wire each of these processes to longitudinally placed bone struts (Fig. 4).[5]

Selection of the best combination of methods of stabilization for a specific case can be as difficult and arbitrary as selection of the best method of decompression. The ideal combination is one which permits the patient to move or be positioned for maximum use of his residual neuromusculoskeletal functional capabilities in the shortest time, with least encumbrance by immobilizing apparatus and without suffering additional loss of neurological function secondary to increased impingement or re-impingement of vertebral elements on the spinal cord or nerve roots. Any known method or combination of methods of stabilization can fail. In selecting methods, both the probabilities for a successful outcome and the magnitude of potential losses from an unsuccessful outcome must be considered. The magnitude of existing neurological loss should not be allowed to influence the duration of prescribed immobilization. A patient with a minor deficit has everything to lose if displacement occurs. A patient with a major deficit must place great reliance on his few remaining capabilities. Therefore, in the latter patient, an apparently trivial additional loss is disastrous.

Stress Ulcers

In the author's experience, the most common cause of death during the early phase of the care of patients with spinal cord injuries is not decubitus ulcers or respiratory or urinary tract infection, but peptic ulcer perforation. Since these patients may lack abdominal pain perception, the first clues to this complication are high fever, abdominal swelling, shock, and hematemesis. If these symptoms develop, immediate laparotomy and repair of the ulcer are necessary. For these reasons, all spinal cord injury patients should be initially placed on a prophylactic ulcer regimen.

Mobilization

After stabilization has been obtained, the patient can be mobilized. Mobilization is necessary to prevent pressure sores and permit development of the patient's potential abilities for self-care. This entails turning, sitting, transfer, wheelchair management, activities of daily living, etc. As a prelude to these activities, the legs must be wrapped to minimize swelling. All limb joints must be ranged daily. When not being ranged, paralyzed hands must be splinted in a functional position with the thumb-web stretched and the thumb held opposite the first two fingers. When at rest, the shoulder should be placed in abduction and moderate external rotation. These measures must be started within several days after the initial injury. Neglect of these measures inevitably permits rapid development of disabling contractures.

Pressure sores are more likely to develop some three weeks following the injury rather than before. No method for their prevention is known which is as effective as turning the patient faithfully at least every few hours. Special pads, mattresses, circle beds, and flotation devices are merely helpful aids in preventing pressure sores. They are not satisfactory substitutes for frequent turning.

Although some useful upper limb activities can be pursued with the patient recumbent, these activities become rewarding only when the patient can be placed in a sitting position. Every effort should be made to sit the patient up as soon as possible. In order to minimize dizziness, exhaustion, and lower limb edema, these initial periods of sitting should be short and frequent. As the patient adapts to the sitting position, these periods should be lengthened. However, especially when the patient is sitting up, special attention must be given to positioning and relief of pressure on the feet. Patients who have an ambulatory potential due to minor cord involvement must be allowed to stand and walk as soon as possible with whatever ambulatory aids are necessary. Patients without ambulatory potential should be adapted to properly sized wheelchairs with whatever accessories such as removable arm rests, head rests, trunk stabilizers, ball bearing feeders, and power systems are indicated. These devices must be carefully prescribed with full knowledge of the limitations of this equipment and the specific needs of the patient. If properly used, electric circle beds with their special turning, tilting, positioning, and transfer features are valuable labor-saving aids in handling and verticalizing either ambulatory or nonambulatory patients.

Functional Splinting

Upper limb functional splints or surgical procedures can substantially enhance the functional abilities of patients with spinal cord injury. As the specific level and extent of permanent neurological deficit become evident, a correct choice of appliances or operations can be made. Due to emergence of each cervical nerve root from the spinal cord at a level higher than the intervertebral level through which it emerges from the spinal canal, total cord injury at any specific intervertebral joint level will usually be associated with sparing of the nerve root emerging from the spinal canal at that level. For example, in a C4-5 vertebral injury, C5 root may escape permanent injury. In this situation, the deltoid and biceps muscles will be functional but not the wrist, hand, or finger muscles. In these cases upper limb function is greatly improved with mobile arm supports and externally powered flexor hinge hand splints. In a C5-6 injury, C6 root may escape injury. In this case, pectoralis major, deltoid, biceps, brachial radialis, supinator, extensor carpi radialis longus, extensor carpi radialis brevis, pronator teres, and flexor carpi radialis muscles, but none of the finger extensors or flexors, will be functional. These patients can benefit from wrist driven hinge splints. In C7-T1 vertebral injuries, C8 root may recover. In addition to function of the above muscles, there will be varying degrees of function of extrinsic finger flexors and extensors. Usually the intrinsics do not recover. A short opponens hand splint with a metacarpo-phalangeal flexion bar is helpful.

Reconstructive Surgery

In a C5-6 injury with good wrist extensors, interphalangeal joint fusion with flexor tendon tenodesis can be substituted for a flexor hinge hand splint. Although an intermetacarpal bone block can be used to maintain thenar web space, an opponens splint is preferable, since the patient can remove it and flatten his hand in order to transfer himself from one surface to another. In C6-7 injuries, the following transfers for improved hand function have been suggested: extensor carpi radialis longus into finger and thumb extensors, brachio-radialis into long thumb flexors, pronator teres into flexor digitorum profundus, and flexor carpi radialis with tendon graft for opposition.

Selection of any of these procedures should be made only after careful observation of how the patient uses his disabled hands during all of his activities. Due to the narrow functional reserve of most of these hands, a procedure which improves one function may prevent another more important function.

Summary

Neurological deficit from transection of the spinal cord is permanent. Salvage of neurological function equivalent to a single nerve root justifies reduction or decompression and stabilization by specific techniques appropriate to the specific nature of the lesion. Successful rehabilitation requires early mobilization and knowledgeable use of assistive equipment and reconstructive procedures. Although care of the patient with spinal cord injury requires the knowledge and skills of many different types of personnel, optimal end results cannot be achieved unless the responsible physician or surgeon has a thorough knowledge of resources available, a consummate skill in their use, intimate familiarity with every detail of the individual case, and most of all, a personal interest in the management of these patients. Five thousand years after the first recorded comments on this condition, the care of the patient with a spinal cord injury remains one of the medical profession's most challenging problems.

When disease is ruled out and psychic tension is implicated

Valium® (diazepam) helps relax the patient and relieve his somatic symptoms

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

How much does illness and lost time cost you?

KEX FLOOR PLAN PACKAGE —SERVICED BY RENTEX— IS EFFECTIVE AGAINST INFECTIOUS GERMS!

Read this Important News Now: — The U.S. Dept. of Agriculture has accepted the following claims for KEX Services:

- "KEX" Walk Off® Mats are chemically treated with an anti-microbial additive to inhibit the growth and spread of environmental bacteria in a mat and to reduce contamination in the areas serviced by Walk Off Mats.
- "KEX" Walk Off® Mats are effective against Staph Aureus.
- "KEX" Walk Off® Mats reduce populations of air and dust-borne Staph Aureus in the areas serviced by Walk Off Mats.
- "KEX" Walk Off® Mats reduce the introduction of bacterial populations in rooms serviced by Walk Off Mats.

Help clean the air for you and your employees. Let your Rentex Service expert show you how to minimize air borne bacteria with KEX Services. Act Now — TODAY! Call CE. 3-5700.

LACTINEX®

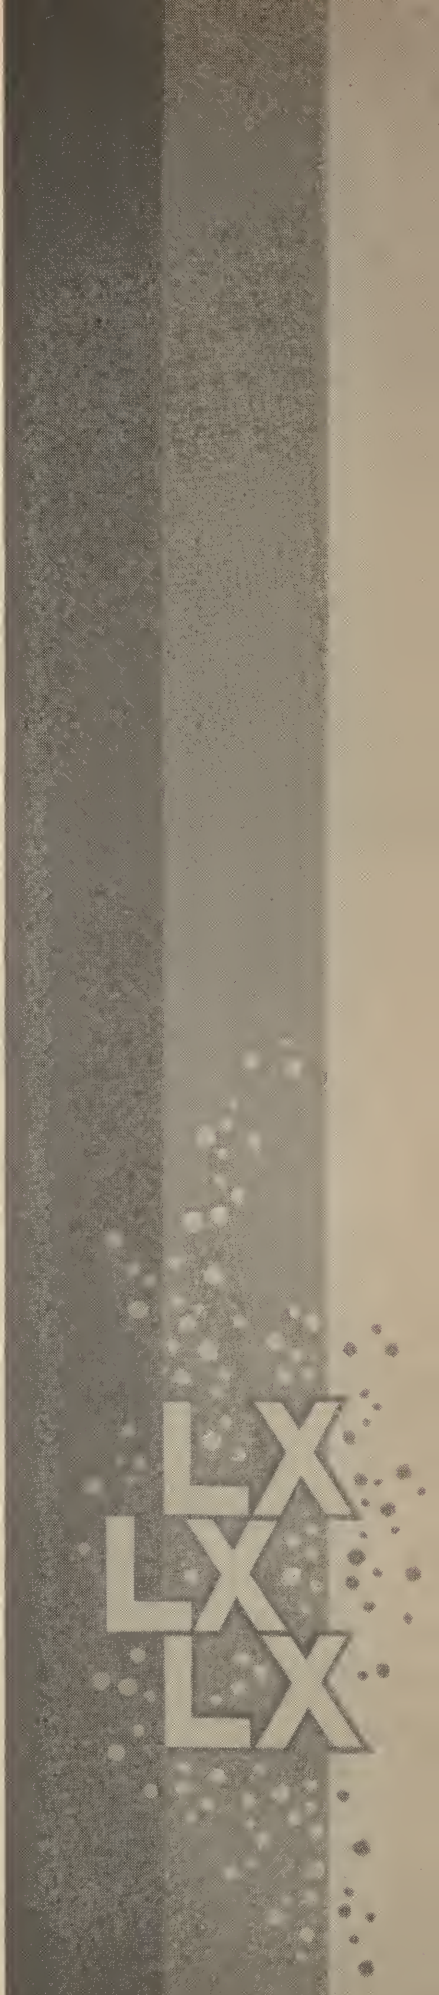
TABLETS & GRANULES

■ **to help restore and stabilize the intestinal flora**

■ **for fever blisters and canker sores of herpetic origin**

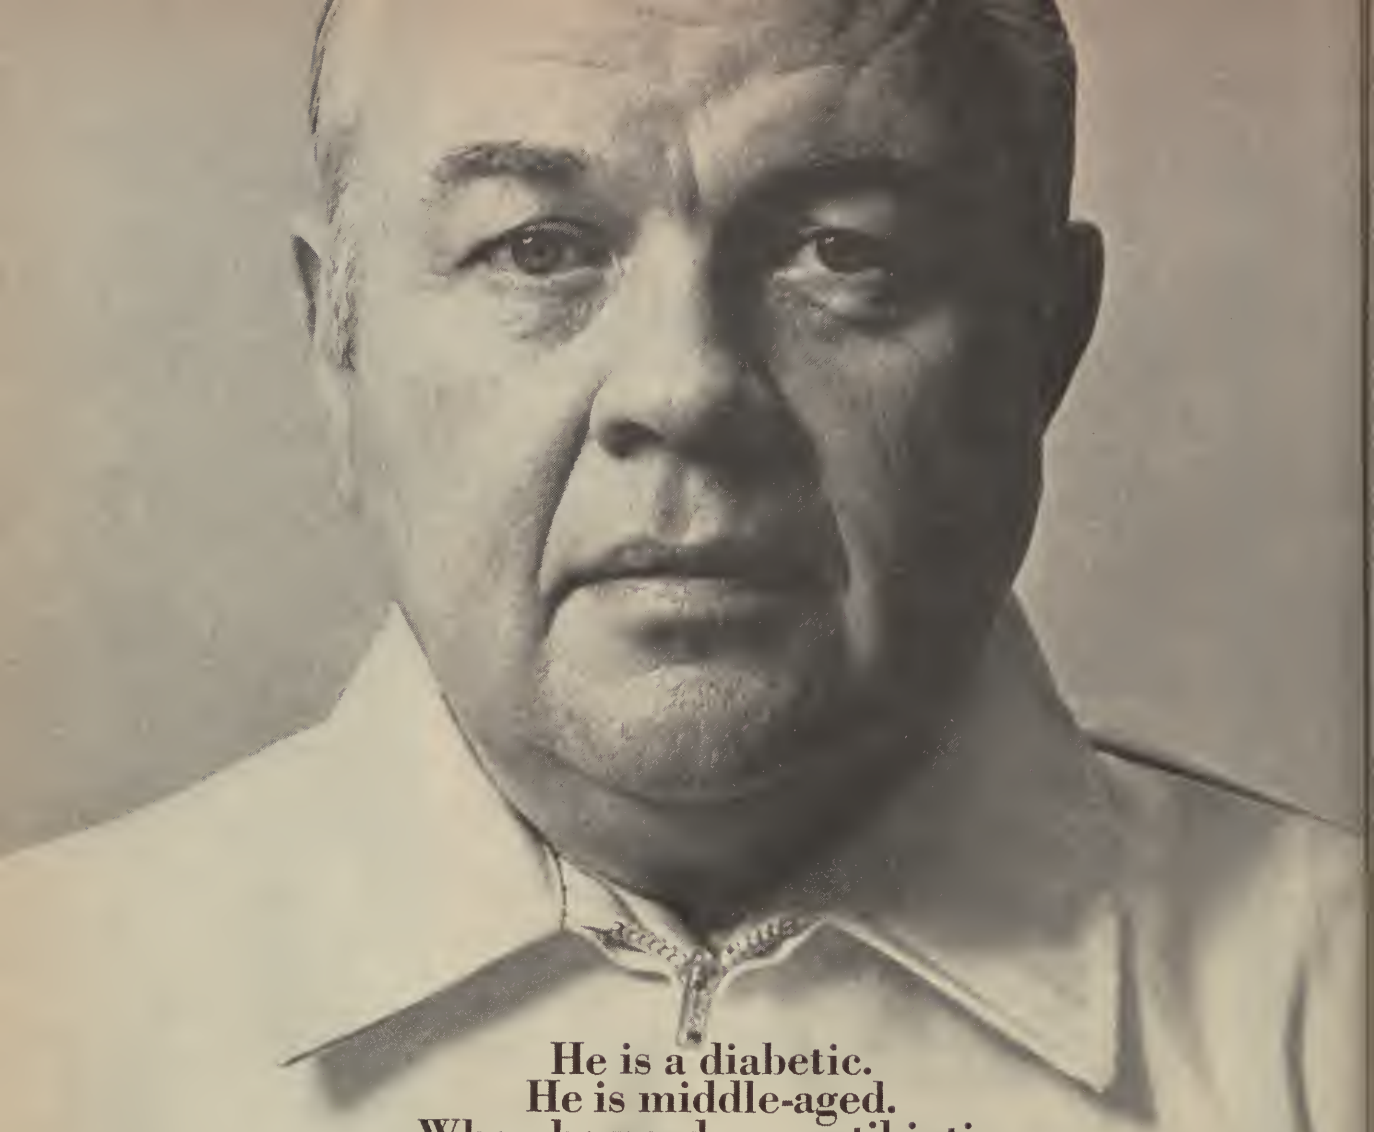
Lactinex contains both *Lactobacillus acidophilus* and *L. bulgaricus* in a standardized viable culture, with the naturally occurring metabolic products produced by these organisms.

Lactinex has been shown to be useful in the treatment of gastrointestinal disturbances, and for relieving the painful oral lesions of fever blisters and canker sores of herpetic origin.[1,2,3,4,5,6,7,8]



No untoward side effects have been reported to date.

Literature on indications and dosage available on request.



HYNSON, WESTCOTT & DUNNING, INC.

He is a diabetic.
He is middle-aged.
When he needs an antibiotic he may be a candidate for

DECLOSTATIN® 300

Demethylchlortetracycline HCl 300 mg and Nystatin 500,000 units CAPSULE-SHAPED TABLETS Lederle

b.i.d.

To guard susceptible patients against intestinal monilial overgrowth during broad-spectrum therapy—the protection of nystatin is combined with demethylchlortetracycline in DECLOSTATIN.

For your susceptible candidates, prescribe DECLOSTATIN —the broad-spectrum therapy that prevents monilial overgrowth.

Effectiveness: Because its antibacterial component is DECLOMYCIN Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, Nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. stant observation is essential. If new infections appear, appro measures should be taken. In infants, increased intracranial pre with bulging fontanels has been observed. All signs and symptoms disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, rhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—macul ular and erythematous rashes; a rare case of exfoliative dermatiti been reported. Photosensitivity; onycholysis and discoloration o nails (rare). Kidney—rise in BUN, apparently dose related. Tran increase in urinary output, sometimes accompanied by thirst (i Hypersensitivity reactions—urticaria, angioneurotic edema, anaphyl Teeth—dental staining (yellow-brown) in children of mothers given drug during the latter half of pregnancy, and in children given the during the neonatal period, infancy and early childhood. Enamel h plasia has been seen in a few children. If adverse reaction or idi crasy occurs, discontinue medication and institute appropriate the Demethylchlortetracycline may form a stable calcium complex in bone-forming tissue with no serious harmful effects reported thu in humans.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Shoul given 1 hour before or 2 hours after meals, since absorption is impa by the concomitant administration of high calcium content drugs, f and some dairy products. Treatment of streptococcal infections sh continue for 10 days, even though symptoms have subsided.

(Continued on page 86)

The girth control pill

Tepanil® Ten-tab®
(continuous release form)

(diethylpropion hydrochloride)

works on the appetite not on the 'nerves'

When girth gets out of control, TEPANIL can provide sound support for the weight control program you recommend. TEPANIL reduces the appetite—patients enjoy food but eat less. Weight loss is significant—gradual—yet there is a relatively low incidence of CNS stimulation.

Contraindications: Concurrently with MAO inhibitors, in patients hypersensitive to this drug; in emotionally unstable patients susceptible to drug abuse.

Warning: Although generally safer than the amphetamines, use with great caution in patients with severe hypertension or severe cardiovascular disease. Do not use during first trimester of pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of therapy, unpleasant symptoms with diethylpropion hydrochloride have been reported to occur in relatively low incidence. As is characteristic of sympathomimetic agents, it may occasionally cause CNS effects such as insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has been reported. In a few epileptics an increase in convulsive episodes has been reported. Sympathomimetic cardiovascular effects reported include ones such as tachycardia, precordial pain, arrhythmia, palpitation, and increased blood pressure. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride; this was an isolated experience, which has not been reported by others. Allergic phenomena reported include such conditions as rash, urticaria, ecchymosis, and erythema. Gastrointestinal effects such as diarrhea, constipation, nausea, vomiting, and abdominal discomfort have been reported. Specific reports on the hematopoietic system include two each of bone marrow depression, agranulocytosis, and leukopenia. A variety of miscellaneous adverse reactions have been reported by physicians. These include complaints such as dry mouth, headache, dyspnea, menstrual upset, hair loss, muscle pain, decreased libido, dysuria, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallowed whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times daily, one hour before meals. If desired, an additional tablet may be given in midevening to overcome night hunger. Use in children under 12 years of age is not recommended.

March, 1970

In a comparative analysis of increases in costs of living, U.S. News & World Report (January 19, 1970) indicates the following percentage changes occurred within the last five years:

physicians' fees up	37.8%
auto insurance up	38.1%
mortgage insurance up	39.2%
household workers up	44.7%
hospital operating room up	67.4%
semiprivate hospital room up	86%
dentists' fees up	30.4%
haircut up	32.9%

NEW AMA APPOINTMENT

Theodore R. Chilcoat, Jr., formerly a Faculty employee, who left to join the AMA Field Service Division in 1965, has been named Director of the Specialty Society Services Department.

1970 PRESIDENTIAL DINNER

The 1970 Presidential Dinner will be held at Blue Crest North on Thursday, April 2, 1970. Tickets, $14 a person, include cocktails before and after dinner; hors d'oeuvres, dinner, dancing, and all gratuities.

Look for reservation envelopes in the mail shortly.

FACULTY QUESTIONNAIRE

A questionnaire soliciting members' advice on the use of various Faculty services or lack of services will be enclosed with the next issue of THE ASSEMBLYMAN.

Members are urged to complete the questionnaire and return it in the special, self-addressed envelope. It is only through each member's response that the Faculty can assess the value of and improve its services.

APPRECIATION TO MEMBERS

Faculty thanks go to those members who have been of inestimable help in contacting legislators during the current session of the General Assembly. Personal contacts by constituents do much to convey the profession's interest in health care and related matters.

If your Component Society has not met with its General Assembly delegation, you are urged to make arrangements for such a meeting. Faculty staff and officers are available to assist you in this regard.

1970/71 COMMITTEE APPOINTMENTS

The President-elect is currently making Committee appointments for the 1970/71 Faculty year. Selections will be made, primarily, from the return card sent all members several months ago.

For those who did not respond, it is not too late to make your wishes known.

ORIENT TRIP

There are still a few places left on the Orient trip leaving from Friendship Airport on May 1. Interested persons should contact Mrs. Beverly Wolins, at Travel Guide Agency, SA-7-1696.

No definitive plans have been completed for scientific meetings in Tokyo and Hong Kong, although it is anticipated that details will be available shortly.

TRIP TO ENGLAND

A possibility exists that the Faculty will have a Charter trip to England for a 7-day period, leaving Baltimore on June 9, 1970 aboard an Air India jet. If interested, contact the Faculty office for more details.

The more interest shown for such a trip, the more likely its availability will be assured.

HEALTH INFORMATION SURVEY

A six-week U.S.P.H.S. Health Examination Survey is being conducted in the Georgetown, Delaware, area. The survey, begun February 9, and scheduled to continue through March 31, 1970, is to determine the fitness of youths age 12 through 17.

in active stages of moderate to severe rheumatoid arthritis,

What more can you

after you've tried

rheumatoid spondylitis, and osteoarthritis of the hip

do for these patients?

salicylates and rest

INDOCIN®

(INDOMETHACIN | MSD)

helps relieve pain, fever,
swelling, and tenderness

Please see new prescribing information on following page.

REVISED PRESCRIBING INFORMATION

IMPORTANT NOTE: INDOCIN (Indomethacin, MSD) cannot be considered a simple analgesic and should not be used in conditions other than those recommended under Indications. The drug should not be prescribed for children because safe conditions for use have not been established.

General Adverse Effects: Because of the high potency of the drug and the variability of its potential to cause adverse reactions, the following are strongly recommended: 1) the lowest possible effective dose for the individual patient should be prescribed. Increased dosage tends to increase adverse effects, particularly in doses over 150-200 mg/day, without corresponding clinical benefits; and 2) careful instructions to, and observations of, the individual patients are essential to the prevention of serious and irreversible, including fatal, adverse reactions, especially in the aging patient.

Indications: Symptomatic relief of adult rheumatoid and degenerative joint disease unresponsive to adequate trial of salicylates and other measures of established value, such as appropriate rest. Has been found effective in active stages of: 1) moderate to severe rheumatoid arthritis including acute flares of chronic disease, 2) moderate to severe rheumatoid (ankylosing) spondylitis, and 3) moderate to severe degenerative joint disease of the hip (osteoarthritis of the hip). Has been found effective in relieving pain and reducing fever, swelling, and tenderness in acute gouty arthritis in selected patients. May enable reduction of steroid dosage in patients receiving steroids for the more severe forms of rheumatoid arthritis; in such instances the steroid dosage should be reduced slowly and the patients followed very closely for any possible adverse effects.

Contraindications: Children 14 years of age and under; pregnant women and nursing mothers; active gastrointestinal lesions or history of recurrent gastrointestinal lesions; allergy to aspirin and indomethacin.

Warnings: *Gastrointestinal Effects:* Because of the occurrence and, at times, severity of gastrointestinal reactions, be continuously alert for any sign or symptom signaling a possible gastrointestinal reaction. The risks of continuing therapy with INDOCIN in the face of such symptoms must be weighed against the possible benefits to the individual patient. Gastrointestinal effects may be reduced by giving the drug immediately after meals, with food, or with antacids. Use greater care in aging patients.
Ocular Effects: Corneal deposits and retinal disturbances, including those of the macula, have been observed in some patients on prolonged therapy. Discontinue therapy if such changes are observed. Ophthalmologic examination at periodic intervals is desirable in patients on prolonged therapy.
Central Nervous System Effects: INDOCIN (Indomethacin, MSD) may aggravate psychiatric disturbances, epilepsy, and parkinsonism, and should be used with considerable caution in patients with these conditions. If severe CNS reactions develop, discontinue the drug.

Precautions: Blurred vision may be a significant symptom that warrants a thorough ophthalmologic examination. Patients should be cautioned about engaging in activities requiring mental alertness and motor coordination, as driving a car. Headache which persists despite dosage reduction requires complete cessation of the drug. May mask the usual signs and symptoms of infection; therefore, the physician must be continually on the alert for this and should use the drug with extra care in the presence of existing controlled infection. After the acute phase of the disease is under control, an attempt to reduce the daily dose should be made repeatedly until the patient is off entirely.

Adverse Reactions: *Gastrointestinal Reactions:* Single or multiple ulcerations of the esophagus, stomach, duodenum, or small intestine, including perforation and hemorrhage, with fatalities in some instances; gastrointestinal bleeding without obvious ulcer formation; perforation o preexisting sigmoid lesions (diverticulum, carc noma, etc.); rarely, increased abdominal pain i ulcerative colitis patients or development of u cerative colitis and regional ileitis; gastriti which may persist after the cessation of th drug; nausea, vomiting, anorexia, epigastric di tress, abdominal pain, and diarrhea.
Eye Reactions: Corneal deposits and retinal di turbances, including those of the macula, hav been observed on prolonged therapy; blurring o vision.
Hepatic Reactions: Rarely, toxic hepatitis an jaundice, including some fatal cases.
Hematologic Reactions: Aplastic anemia, hemo lytic anemia, bone marrow depression, agranulo cytosis, leukopenia, and thrombocytopenic pur pura. Since some patients manifest anemia sec ondary to obvious or occult gastrointestina bleeding, appropriate blood determinations ar recommended.
Hypersensitivity Reactions: Acute respiratory di tress, including dyspnea and asthma; angiitis pruritus; urticaria; angioedema; skin rashes.
Ear Reactions: Hearing disturbances, deafness tinnitus.
Central Nervous System Reactions: Psychotic epi sodes, depersonalization, depression, coma, con vulsions, peripheral neuropathy, drowsiness mental confusion, lightheadedness, dizziness headache.
Cardiovascular-Renal Reactions: Edema, elevatio of blood pressure, hematuria.
Dermatologic Reactions: Loss of hair, erythema nodosum.
Miscellaneous: Rarely, vaginal bleeding, hyper glycemia, glycosuria, ulcerative stomatitis, and epistaxis.

Supplied: Capsules containing 25 mg indometh acin each, in bottles of 100 and 1000; capsules containing 50 mg indomethacin each, in bottles of 100.

Nose clear as a whistle

(THANKS TO DIMETAPP®)

Dimetapp Extentabs® does an outstanding job of helping to clear up the stuffiness, drip and congestion of colds and upper respiratory allergies and infections. Each Extentab keeps working up to 12 hours. And for most patients drowsiness or overstimulation is unlikely. Try Dimetapp. It clearly works.

FOR UPPER RESPIRATORY ALLERGIES AND INFECTIONS

Dimetapp Extentabs®

Dimetane® (brompheniramine maleate), 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.

UP TO 12 HOURS CLEAR BREATHING ON ONE TABLET

Indications: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, sinusitis, rhinitis, conjunctivitis, and otitis.
Contraindications: Hypersensitivity to antihistamines. Not recommended for use during pregnancy.
Precautions: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.
Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered.
Dosage: 1 Extentab morning and evening.
Supplied: Bottles of 100 and 500.

RICHMOND, VA. 23220

A·H·ROBINS

Hasn't the driver had enough excitement for one day?

For the patient who has been through an accident, the worry and anxiety following the mishap may actually heighten the perception of pain. This is why there's a classic ¼ grain *sedative* dose of phenobarbital in Phenaphen with Codeine—to take the nervous "edge" off, so the rest of the formula can control the pain more effectively.

Driver Escapes Serious Injury When Truck Jackknifes

SHENANDOAH, JULY 16. Roger Sherman of Waynesboro suffered head lacerations but escaped serious injury when the tractor-trailer he was driving skidded on Deep Run Bridge and jackknifed. It took rescue workers thirty minutes to remove him from the cab which was dangling over the edge of the bridge. Sherman is resting comfortably in University Hospital where his condition is listed as satisfactory.

Frankhouser called my attenti

Phenaphen® with Codeine

Phenaphen with Codeine Nos. 2, 3, or 4 contains: Phenobarbital (¼ gr.), 16.2 mg. (warning: may be habit forming); Aspirin (2½ gr.), 162.0 mg. Phenacetin (3 gr.), 194.0 mg.; Hyoscyamine sulfate, 0.031 mg. Codeine Phosphate, ¼ gr. (No. 2), ½ gr. (No. 3), or 1 gr. (No. 4) (warning: may be habit forming).

The compound analgesic that calms instead of caffeinates

Indications: Phenaphen with Codeine provides relief in severer grades of pain, on low codeine dosage, with minimal possibility of side effects. Its use frequently makes unnecessary the use of addicting narcotics. Contraindications: Hypersensitivity to any of the components. Precautions: As with all phenacetin-containing products excessive or prolonged use should be avoided. Side effects: Side effects are uncommon, although nausea, constipation and drowsiness may occur. Dosage: Phenaphen No. 2 and No. 3—1 or 2 capsules every 3 to 4 hours as needed; Phenaphen No. 4—1 capsule every 3 to 4 hours as needed. For further details see product literature.

The AMBAR® SCRAPBOOK of Obesity Oddities
FACT & LEGEND

CONTROL FOOD AND MOOD ALL DAY LONG WITH A SINGLE MORNING DOSE

AMBAR #2 EXTENTABS®

methamphetamine HCl 15 mg., phenobarbital 64.8 mg. (1 gr.)
(Warning: may be habit forming).

One Ambar Extentab before breakfast can help control most patients' appetite for up to 12 hours. Methamphetamine, the appetite suppressant, gently elevates mood and helps overcome dieting frustrations. Phenobarbital, the sedative in Ambar, controls irritability and anxiety... helps maintain a state of mental calm and equanimity. Both work together to ease the tensions that erode the willpower during periods of dieting.

Also available: Ambar #1 Extentabs®—methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

BRIEF SUMMARY/**Indications:** Ambar suppresses appetite and helps offset emotional reactions to dieting. **Contraindications:** Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. **Precautions:** Administer with caution in the presence of cardiovascular disease or hypertension. **Side Effects:** Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. See package insert for further details.

172nd ANNUAL MEETING SPEAKERS
APRIL 1, 2, 3

MEDICAL AND CHIRURGICAL FACULTY OF MARYLAND

Among the many prominent physicians who will speak at the Annual Meeting are **William P. Beetham, Jr., MD, and Felix Wroblewski, MD.***

William P. Beetham, Jr., MD, will deliver the George M. Boyer Lecture on "Physical Examination of the Joints—A Challenge," on Friday morning, April 3. His paper will present a method for conducting the physical examination of peripheral joints as a guide for the evaluation of joint involvement in the various rheumatic diseases. He will also serve as moderator at one of the round-table luncheons on Thursday, April 2, leading the discussion on "Collagen Disorders."

Dr. Beetham

Dr. Beetham was born in Boston and graduated from Ohio Wesleyan University. He received his MD degree from the University of Rochester Medical School in 1955 and interned at the Boston City Hospital. After two years in the Army Medical Corps, he became a Fellow in Medicine at the Mayo Clinic from 1958 to 1962. He was an Assistant Professor of Medicine at the University of Alabama Medical Center from 1962 to 1965. Dr. Beetham has been on the staff of the Lahey Clinic Foundation in Boston since 1965 as a rheumatologist in the Department of Internal Medicine. He is also a staff member of the New England Deaconess and New England Baptist hospitals.

He is a member of the American Board of Internal Medicine and is a Fellow of the American College of Physicians. Dr. Beetham is senior author of the book, *Physical Examination of the Joints* (W. B. Saunders), and has published 41 medical articles.

"Diagnostic Limitations of Body Fluid Enzyme Alterations: A Reappraisal" is the title of the Jesse C. Coggins Fund Lecture to be delivered by **Felix Wroblewski, MD,** Thursday morning, April 2. He will also moderate the round-table luncheon discussion of "What's the Matter with Doctors?" A native of New York city, Dr. Wroblewski received his BA degree from New York University in 1942 and his MD degree from the Medical College of that university in 1945. He served an internship at Bellevue Hospital in New York from 1945 to 1946 and was appointed to fellowships in clinical medicine, medicine, and biochemistry at the Sloan-Kettering Institute. He is board certified in internal medicine. He served in the Army Medical Corps from 1946 to 1948, and taught at Cornell University Medical College from 1952 to 1968. He also served as Visiting Professor at the University of Venezuela College of Medicine in 1961.

Dr. Wroblewski

Dr. Wroblewski has been appointed to several research positions, and served as consultant to the Diagnostic Research Branch of the National Institutes of Health in Bethesda in 1961. He has received numerous awards for research and service, including the Hekoen Bronze Medal from the AMA in 1955.

He is a member of such organizations as the American Federation for Clinical Research, the American Association for the Advancement of Science, and the American Medical Association. He was Director of the American Cancer Society, and is a Fellow of the American College of Physicians.

Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD

One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.

Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

Quinamm™
(quinine sulfate 260 mg., aminophylline 195 mg.)

Specific therapy for night leg cramps

Treating vaginitis is as easy as AVC

Trichomonads...Monilia...Bacteria

You can depend on AVC—the comprehensive therapy that acts against all three major vaginal pathogens.

Monilia emerging as a major therapeutic problem—
recent studies report increased incidence, attributed in part to the use of oral contraceptives,[1-4] broad-spectrum antibiotics[5-9] and prolonged use of corticosteroids.[7]
recent evidence establishes high rate of microbiological and clinical cure with AVC.[9-11]

Comprehensive — Effective

The published record and more than two decades of clinical experience clearly establish the therapeutic value of AVC in vaginitis/cervicitis and vaginal surgery.

Easy as AVC

Contraindications: Known sensitivity to sulfanomides.
Precautions/Adverse Reactions: The usual precoutians far tapical and systemic sulfanomides shauld be abserved because af the possibility af obsarptian. Burning, increased lacol discomfart, skin rosh, urticaria or other monifestotions of sulfanamide taxicity are reasans ta discantinue treatment.
Dosage: One applicatarful ar ane suppasitary intravaginally ance ar twice daily.
Supplied: Creom—Faur-ounce tube with ar withaut applicator. Suppasitories—Bax af 12 with applicatar.

GASTROENTEROLOGIC MEDICINE, Moses Paulson, MD; Lea and Febiger, Philadelphia, Pennsylvania, 1969.

The contributors to this book constitute a veritable *Who's Who in Medicine*. Not the least distinguished is the author, a Marylander who has long been active and deeply interested in Faculty affairs.

Dr. Paulson has made a valiant and successful attempt to include in a single comprehensive volume all of the disorders involving the alimentary canal and its accessory organs, the liver, gall bladder and pancreas. The result is a book that has something for almost every physician, whether he is primarily interested in gastroenterology or another specialty. It is especially valuable to the internist, pediatrician and generalist. Exclusive of the index, this book contains over 1,500 pages.

Radiologic and psychologic factors are presented in some detail, including the comparatively new fields of cineradiography, arteriography, percutaneous portography, and splenoportography. Psychiatrists may also be interested, although this area of medicine is presented with the non-psychiatrist in mind.

To mention or discuss in detail the various specific areas covered in different chapters would consume too much space. However, all recent advances and changes in this field have been well covered. The internist's interests have been dovetailed with those of the surgeon, when surgical intervention would appear to be a necessary adjunct to the more conservative treatment by the medical man. While certain areas overlap in content and are perhaps repetitious, this has been done either to present a different view, to attain clarity, or to provide completeness of the specific subject or area. Dermatologists will be particularly interested in the demonstrated evidences which reveal gastroenterologic disorders. With the ease of travel today, with parasitic infestation and infection gaining increased importance, this is extremely valuable.

The index is purposely extensive, so that the reader can easily find reference to any particular area. Dr. Paulson and his collaborators can be proud of the monumental result of their efforts.

CARDIAC ARREST AND RESUSCITATION, Hugh E. Stephenson, Jr., MD; The C. V. Mosby Company, St. Louis, Missouri, 1969.

This is the third edition of this publication, and, as in previous editions, it attempts the difficult task of accurately portraying the recent advances and techniques, many in ancillary areas, in the field of present-day cardiopulmonary resuscitation. Included in this edition is a concise review of the historical perspective of cardiopulmonary resuscitation, which adds to the readability of the book, making it well worth adding to the medical library shelves of the interested physician.

PLASTIC AND MAXILLOFACIAL TRAUMA SYMPOSIUM, VOLUME I, Nicholas G. Georgiade, DDS, MD, et al; The C. V. Mosby Company, St. Louis, Missouri, 1969.

This is the first in a series of transactions of the trauma symposium, held under the auspices of the Educational Foundation of the American Society of Plastic and Reconstructive Surgeons.

It is intended to define the specialties within the field and to foster cooperative efforts of care in providing for the needs of the patient. It serves these purposes well.

SYMPOSIUM ON CANCER OF THE HEAD AND NECK, Volume II, John C. Gaisford, MD; The C. V. Mosby Company, St. Louis, Missouri, 1969.

Volume II of this series consists of the proceedings of the Second Annual Symposium of the Educational Foundation of the American Society of Plastic and Reconstructive Surgery held in late 1968.

In the preface, Dr. Gaisford indicates that the topic for this second symposium was chosen because of the commonness with which cancer occurs in this area, and because in many areas of the United States, the proper overall management of cancer of the head and neck "leaves a lot to be desired".

The book covers diagnosis, modern advances for the cure of these tumors, and practical, direct methods for prompt surgical reconstruction of damaged parts. Only the most prestigious individuals were chosen to present papers at this session. A plea is made that ". . . this work be undertaken only by those properly trained". In making this plea, the point is also made that plastic surgeons have "no corner on this market" but rather all disciplines of the profession should join together for the ultimate benefit of the patient.

ARTS AND HOBBY EXHIBIT

Annual Meeting of the Medical and Chirurgical Faculty

APRIL 1, 2, 3, 1970 The Alcazar, Baltimore

APPLICATION FOR ARTS AND HOBBY EXHIBIT

Fill in and mail to: Chairman, Arts and Hobby Exhibit
Medical and Chirurgical Faculty
1211 Cathedral Street, Baltimore 21201

1. Title of exhibit: .....

.....

2. Amount of space required—depth, width, and height: .....

3. Electrical or other requirements: .....

4. Name of exhibitor: .....
Please print

5. Address of exhibitor: .....

6. Telephone number of exhibitor: .....

An Arts and Hobby Exhibit will be held during the 172nd Annual Meeting of the Medical and Chirurgical Faculty. Physicians, their wives and families are asked to help make this exhibit an outstanding one with many interests on display. Anything made by the exhibitor is eligible. Entries will be accepted until all exhibit space is allotted. Please have exhibits framed or mounted.

Entries should be delivered to The Alcazar, Cathedral and Madison Streets, Baltimore, between 9:00 AM and 4:30 PM on Tuesday, March 31. They must be removed on Friday, April 3, between 1:30 and 4:30 PM. The Faculty cannot carry insurance on your exhibit, but utmost care will be taken of it. There will be a watchman on duty when the meeting is not in session. Probably the exhibitors' personal policies will cover the exhibit.

Certificates will be awarded to the prize-winning exhibits. The names of exhibitors received by February 1, 1970, will be listed in the printed Annual Meeting program. However, all entries should be submitted as early as possible.

Committee for Arts and Hobby Exhibits:

Mrs. Charles H. Williams, *Chairman*
Mrs. George H. Yeager, *Chairman, Judging*
Mrs. Kurt Lederer
Mrs. Marvin I. Mones

MAKE YOUR HOTEL ROOM RESERVATIONS NOW

for the

ANNUAL MEETING OF THE MEDICAL AND CHIRURGICAL FACULTY

APRIL 1, 2, 3, 1970

A block of rooms has been set aside at the BELVEDERE HOTEL, Baltimore, for those attending this meeting. Because of many activities in the city, rooms will be at a premium.

The rates are $19.00 for a double or twin bedded room for two persons; single occupancy rate is $15.00; and suites are $25, $30, and $40.00.

FOR YOUR HOTEL RESERVATION DETACH AND MAIL THIS SLIP DIRECTLY TO:

Mrs. Jacqueline Amati
BELVEDERE HOTEL
Charles & Chase Sts., Balto., Md. 21202

Name .....

Address ..... City ..... State .....

Please reserve ..... rooms Approximate rate ..... No. of persons.....

Date of arrival ..... Date of departure .....

Attending Annual Meeting of the Medical and Chirurgical Faculty.
All requests subject to confirmation.

MED-CHI TOUR

The Medical and Chirurgical Faculty is sponsoring another exciting tour in the near future:

ORIENTAL CARNIVAL—May 1 to May 17, 1970

A fabulous deluxe tour leaving from Friendship Airport. This is an all-inclusive tour with six fun-filled days and nights in Tokyo, seven glorious days and nights in Hong Kong, three enchanting days in Honolulu. An opportunity is provided to visit the fabulous 1970 Japan World Exposition in Osaka via the famous "Bullet" train (140 m.p.h.). Included are sightseeing tours, a get-together cocktail party, dinners in restaurants of your choice, breakfasts, and many other attractions.

Make your reservations NOW: For information and reservations contact Mrs. Beverly Wolins, Travel Guide Agency, 416 North Charles Street, Baltimore 21201 (301-727-0680) or Mrs. Genevieve Ritchie, the Faculty office, 1211 Cathedral Street, Baltimore 21201 (301-539-0872).

MEDICAL NEWS

Governor Marvin Mandel recently announced that the use of DDT in Maryland has been virtually banned, except in cases where the public health is threatened by epidemic, because of its potential hazards to the health of Maryland citizens and the state's wildlife and waterfowls.

The regulations on DDT were prepared by the State Board of Agriculture, in consultation with the State Department of Health and Mental Hygiene and representatives of the Department of Natural Resources, and the Maryland Agricultural Commission.

In addition to DDT, other chlorinated hydrocarbons and other pesticides whose use is sharply restricted under the new regulations are chlordane, dieldrin, endrin, parathion and methyl parathion. Sodium arsenite is banned completely in Maryland under the order.

Governor Mandel

In December, by a vote of 88 to 4, the U.S. Senate passed H.R. 13111 appropriating $21 billion for HEW for fiscal 1970. Of that amount, $52.2 million will go to the Health Services and Mental Health Administration for community mental health centers and narcotic addict rehabilitation; $100 million is authorized for Regional Medical Programs of which $25 million is earmarked for development, assistance, and chronic disease control activities; $258 million is allocated for hospital construction; $200 million to the National Cancer Institute; $182 million to the National Heart Institute; $25 million to the National Eye Institute and $160 million for the construction of health education research and library facilities; and $215 million for health manpower.

The bill is currently in the House for concurrence of the Senate amendments.

Effie O. Ellis, MD, former director of medical education and house pediatrician at Provident Hospital, has been named to the newly created American Medical Association post of Special Assistant for Health Services for E. B. Howard, MD, AMA executive vice president.

Dr. Ellis recently served as chairman of a panel group at the 1969 White House Conference on Food and Nutrition. She has held several federal posts. She is currently the director of maternal and child health for the Ohio State Department of Health.

* * *

Blaine H. Eig, MD, has been re-elected president of the Medical and Dental Staff of Holy Cross Hospital in Silver Spring.

A specialist in internal medicine, Dr. Eig was a member of the organizing committee of physicians who formed the medical staff of Holy Cross Hospital prior to its opening in January 1963.

Elected to serve with Dr. Eig were **Timothy Tehan, MD, vice president; Joseph O'Neil, MD, secretary-treasurer; Albert Modlin, MD, and Richard Pollen, MD, members-at-large of the executive committee.**

Other members of the executive committee are Nicholas Azzato, MD, chairman, department of surgery; Manuel Balsiero, MD, chairman, department of anesthesia; Edward Beeman, MD, chairman, department of medicine; Stanley Wolf, MD, chairman, department of pediatrics; Robert McCullough, MD, chairman, department of pathology; James S. Stanton, MD, chairman of the department of obstetrics and gynecology; Merton White, MD, chairman, department of general practice; Edward Soma, MD, chairman, department of radiology; John P. Haberlin, MD, immediate past president; and Sister Helen Marie, CSC, hospital administrator.

Joseph S. Hall, an executive with the Model Cities Agency in Baltimore, has been named assistant director of planning for The Johns Hopkins Medical Institutions.

Dr. David E. Price, director of planning at the Medical Institutions said Mr. Hall will take steps to involve community groups in development of facilities and community service programs. He will also provide liaison with other community agencies.

* * *

During a recent meeting of the American Association of Obstetricians and Gynecologists in Hot Springs, Va., **J. Donald Woodruff, MD, Baltimore, was elected assistant secretary of the association.**

* * *

Earl H. Dearborn, MD, a 1949 graduate of The Johns Hopkins University School of Medicine, has been appointed president of the newly constituted Therapeutic Research Division of the Professional Products Group of Miles Laboratories, Inc., of Elkhart, Indiana.

* * *

Orthopedic surgeons at The Johns Hopkins University School of Medicine are reportedly among the first in the country to be treating patients with severe arthritis of the hip by replacing the entire hip with an artificial one. The technique, designed and perfected in Europe, has a success rate of 90% among the 5,000 patients who originally received the artificial hip in Europe.

Some of the benefits of this technique as opposed to an older version requiring fusion of the joint include a shorter hospital stay, less risk for elderly patients, and greater mobility after the recovery period. The first total-hip operation was performed at The Johns Hopkins Hospital in October of last year. Since then, it has been repeated seven times, with one patient receiving two artificial hips. Seventy hip replacements a year are being anticipated by Hopkins surgeons.

Robert Robinson, MD, professor of orthopedic surgery; Lee H. Riley, Jr., MD, associate professor of orthopedic surgery; and Gerald A. M. Finerman, MD, assistant professor of orthopedic surgery traveled to Europe to study the technique of the operation before offering it to patients at Hopkins.

* * *

B. Martin Middleton, MD, has assumed the presidency of the medical staff at St. Agnes Hospital.

As president, Dr. Middleton is chairman of the executive committee which serves as the governing body for St. Agnes' medical staff. In addition to Dr. Middleton, the officers of the medical staff for 1970 include: **Wilmer K. Gallager, Jr., MD, immediate past-president; Stephen K. Padussis, MD, president-elect; and Samuel P. Scalia, MD, secretary-treasurer.**

A native of Waldorf, Dr. Middleton received his BS and MD degrees from the University of Maryland. He served an internship and completed his residency at St. Agnes.

He is a Fellow of the American College of Surgeons and holds membership in the AMA, Southeastern Surgical Congress, and the Baltimore City Medical Society. Dr. Middleton is chairman of the Faculty's Legislative Committee.

Dr. Middleton

A Cecilton physician has returned to Vietnam for the fifth time to lend his professional services to the wounded and sick civilians under the Volunteer Physicians for Vietnam program of the AMA.

Wayne Foster, MD, is currently serving the 60-day tour with 14 other physicians from across the country.

* * *

Establishment of local sports-medicine councils located within school board areas has been proposed by the American Academy of Pediatrics.

The academy's Committee on Youth urges all national organizations interested in the health status of children and youth participating in sports and recrea-

tional activities "to approve, actively support, and encourage all its membership to develop these councils in every community throughout the United States."

Membership in the sports-medicine council would consist of the school administrator, athletic coach, trainer, physician, and athletes. The council would be primarily responsible for: • evaluating local resources—material and individual—available for the provision of the highest quality of health care of the athlete; • reviewing and implementing established policies of national organizations which are recognized as leaders in health concerns for the athletic participant; • inspecting sports equipment periodically, and calling any deficiencies and substandard equipment to the attention of the appropriate authorities who, in turn, would have the authority to cancel any athletic event until the necessary recommendations have been enacted; • reviewing instances where injury or illness related to sportsmedicine and relating them to the public, local medical societies, school administrators, coaches, trainers, athletes, and others; • and promoting workshops, conferences, and other educational endeavors for the preparation and continuing instruction of those who are responsible for the health and safety of young athletes.

The Johns Hopkins Hospital and the Baltimore office of the National Alliance of Businessmen have signed a training contract to enable the hospital to hire and train 55 disadvantaged workers from the Baltimore area.

The men and women hired under the contract will be trained for jobs as central supply aides and orderlies. They will be referred to the program by the Maryland State Employment Service and Concentrated Employment Program.

In addition to on-the-job training, the hospital will provide classroom education, special counseling, job coaching, and other services to help the workers stay on the job.

* * *

The cooperation of physicians is requested in the **referral of women for a study of ovarian cancer** being conducted by the Department of Obstetrics and Gynecology at the George Washington University Medical Center, Washington, D.C.

Referrals of women with proven or suspected ovarian cancer are needed. Selected women with a preoperative diagnosis or those with a proven operative diagnosis before radiation therapy or chemotherapy will be studied to determine peritoneal fluid cellular patterns. Attempts at therapy will be made and experimental drugs may be used in conjunction with serial cellular studies.

Physicians interested in having their patients considered for admission to the studies may write or phone: Larry McGowan, MD, Department of Obstetrics and Gynecology, The George Washington University Medical Center, 2150 Pennsylvania Ave., N.W., Washington, D.C. 20037. (202) 331-6357.

* * *

The Carnegie Corporation and the Commonwealth Fund have announced grants to The Johns Hopkins University to develop and demonstrate new systems of community health care which will provide a full range of medical services to thousands of individuals.

The three-year grant, totalling $500,000, will aid in the establishment of the prepaid, comprehensive care program for the residents of Columbia and a similar cooperative venture in East Baltimore, as well as a thorough reorganization of the Johns Hopkins Hospital Outpatient Department to provide specialty clinic backup for the two prepaid care programs, and better primary and specialty care for East Baltimore residents in general.

Within five years, it is anticipated that more than 50,000 individuals will be enrolled in the two prepaid programs. A clinic has been opened and construction begun on a permanent facility in Columbia. Discussions and planning are proceeding with representatives of the East Baltimore community with the hope that the program can begin sometime this year and will include a large clinic removed from the immediate area of the hospital.

* * *

AMA President, Gerald D. Dorman, MD, testified before the Subcommittee on Health of the Senate Labor and Public Welfare Committee in December to urge increased federal support of family planning programs and activities.

Dr. Dorman noted that while there are many existing federal programs of family planning, it is estimated that five million women are still without access to family planning services. He also indicated the urgent need for a greatly expanded program of population research, and for a broad scale public education and information program.

The new officers of the Allegany County Medical Society are: **Robert Feddis, MD, president; William R. Newman, MD, vice-president; and Nicholas Giarritta, MD, secretary-treasurer.**

The following members of the society were elected as delegates to the Med/Chi House of Delegates: **George Simons, MD, Gina Glick, MD, and Robert J. Dawson, MD.**

* * *

Gary W. Gill, CT (ASCP), chief research associate of the Cytopathology Division of The Johns Hopkins University School of Medicine, has prepared a booklet on "Exfoliative Cytology".

The booklet contains detailed information on the collection and preparation of cytopathological specimens of cerebrospinal fluid, sputum, body cavity fluids, urine, peripheral blood and cells exfoliated from esophageal lesions or the gastric mucosa. The booklet includes instruction in fixation, staining, mounting, and microscopy, plus a bibliography of selected references on exfoliative cytology.

Copies may be obtained, free of charge, from Millipore Corporation, Bedford, Mass. 01730.

* * *

In December, the FDA announced its decision to order recalled from the market oxytetracycline capsules, produced by eight manufacturers, because of FDA's determination that those products are of questionable medical value.

Chas. Pfizer & Co., Inc. first discovered the drug in 1949 and has been manufacturing and distributing the drug throughout the world under the trade name "Terramycin". Since the expiration of the Pfizer patent in 1967, oxytetracycline capsules have been manufactured and distributed in the U.S. by a number of other companies under the generic name and other brand names.

Pfizer initially provided the FDA with the results of its blood level studies on a number of oxytetracycline products. The specific study of blood levels involved in the use of Pfizer's product, Terramycin, have been adopted as the standard by which FDA is judging the other capsules submitted for certification. Pfizer's product has not been withdrawn and is not affected by FDA's action.

This appears to be another instance which emphatically demonstrates that drugs of the same generic name are not necessarily equivalent therapeutically.

For one week in May, 450 of the brightest young people in the world will gather in Baltimore to exhibit their achievements in science.

The 21st International Science Fair will be held at the Baltimore Civic Center, May 10-15, 1970. Sponsored by the Science Service, the North Baltimore Kiwanis Club, and The Johns Hopkins University, the Fair was created to promote interest among young people in the fields of pure and applied science.

* * *

Modern Medicine has included **Julius Axelrod, PhD,** among its winners of the Journal's Distinguished Achievement Awards for 1970.

Dr. Axelrod, chief of the section of pharmacology, Laboratory of Clinical Science, National Institute of Mental Health, Bethesda, was cited for his research into the effects of drugs on the body and the sympathetic nervous system.

Some of the other Maryland recipients through the years have been: Alfred Blalock, MD—1960; Walter E. Dandy, MD—1935; Nicholson J. Eastman, MD—1959; John E. Howard, MD—1964; Perrin H. Long, MD—1938; Victor A. McKusick, MD—1966; Harvey B. Stone, MD—1934; Helen B. Taussig, MD—1953; and Hugh H. Young, MD—1938.

* * *

The American College of Surgeons has appointed **John D. Young, MD,** of Baltimore, to the Advisory Council on Urology.

* * *

The new president of the American Society for Surgery of the Hand is **Raymond M. Curtis, MD,** of Baltimore.

Dr. Curtis was installed January 15 at the society's annual meeting in Chicago.

He is assistant professor in plastic surgery at The Johns Hopkins University School of Medicine, and is consultant in hand surgery to the Surgeon General of the Army. He is a visiting hand surgeon at the Union Memorial Hospital and the Children's Hospital.

Dr. Curtis

* * *

A major strengthening of Maryland's health services, through the creation of a Directorate for Mental Retardation under the Department of Health and Mental Hygiene, has been announced by Neil Solomon, MD, PhD, secretary of Health and Mental Hygiene.

Dr. Solomon stated that the directorate method of organization would allow for considerable flexibility for future needs. The new organization, placing high priority on services to the retarded, will be headed by a director, who will have equal

stature with the existing commissioners of health, mental hygiene, directors of juvenile services and the comprehensive health planning agency. The activities of the Directorate will encompass institutional care now operated by the Department of Mental Hygiene; community-based care, a Health Department function; liaison with state and local departments of education involved with special education; and research, development, and prevention.

Being shifted to the new Directorate will be Rosewood State Hospital, Henryton State Hospital for adult retardates, and the Maryland Metropolitan Washington Retardation Center (Silver Spring) which will be completed by July.

Under the community-based program, the Directorate will be concerned with: day care and training centers in the state; hospital screening of newborns for treatment and follow-up of phenylketonuria; inspection and licensing of hospitals and residential centers, in cooperation with the Division of Medical Facilities Development; community diagnostic and advisory services for handicapped children, in cooperation with the Division for Crippled Children; provision of special consultation services for the mentally retarded—psychology services, nutrition services, public health nursing, occupational therapy, health education, and social work services.

* * *

HEW Secretary Robert H. Finch has announced that the voluntary medical insurance premium older people pay for Medicare will be $5.30 a month for the 12-month period beginning July 1.

Secretary Finch noted that the present $4 premium rate, set in December 1969, is too low to cover costs during the current premium period and that the special Medical Insurance Trust Fund is now drawing on its reserves.

* * *

On February 8, **Edward P. Radford, MD,** professor of environmental medicine at The Johns Hopkins University School of Hygiene and Public Health, spoke at the Annual Scientific Session of the Maryland Thoracic Society held in Baltimore.

Dr. Radford, featured as the Trudeau Lecturer, spoke on the Medical Aspects of Air Pollution and its Control.

During the session a special panel discussion on Cortico Steroids in Sarcoidosis was held. The moderator was **Carol Johns, MD,** director of the Sarcoid Clinic of The Johns Hopkins University.

* * *

More intensive and long-range research on the dangerous effects of the use of marijuana has been called for by **Neil Solomon, MD, PhD,** the State Secretary of Health and Mental Hygiene.

"For some time I have maintained that all of the facts dealing with the harmful effects of marijuana are not yet in. We need an additional five years of research to determine both the extent of these effects and to what dangers continual use can ultimately lead," he stated.

Dr. Solomon went on to say, "However, to say outright, at this point, that the drug is only psychologically habituating and that there are no serious side effects is wrong. It's an unpredictable drug, used by unpredictable people, which brings about unpredictable reactions."

He also said that more and more frequently young people are using marijuana and abusing it to the extent that in some instances hospitalization is required. He said that smoking of marijuana can produce any number of immediate and physical effects which become progressively stronger to the chronic user. Dr. Solomon added that the effects on the brain pose the greatest problem, since the user may become psychotic.

In addition, he said, "Actually, a sufficient dose of marijuana brings on a state of temporary insanity. If a user is extremely sensitive to it, even a small dose of the drug can cause this reaction, and actions become totally unpredictable. Habitual use leads to increased doses and an even greater psychological dependence."

Dr. Solomon

A new method of paying for health care services designed to get increased value for the Medicare health care dollar, is being tested in New York city under a contract signed by Robert M. Ball, commissioner of social security, and the Health Insurance Plan of Greater New York (HIP).

One of the major objectives of the three-year experiment is to encourage the use of alternatives to high cost hospital care suitable to each patient's progressive condition.

* * *

Campbell's Soups... wide variety...for limited appetites

Many people lose interest in food as they grow older. Some of them are fussy eaters—with only a few favorite foods. Others become indifferent to foods—because planning and preparing meals becomes a chore. Here Campbell's Soups can help —for these four very good reasons:

Appeal With a variety of tastes, textures, aromas, and colors, Campbell's Soups can add interest and appetite appeal. And they're easy to eat—ingredients are tender, bite-size. Even patients on special diets will find soups they can enjoy among the more than 50 different varieties available.

Nourishment Campbell's Soups contain selected meats and sea foods, best garden vegetables—carefully processed to help retain their natural flavors and nutritive values.

Convenience Within 4 minutes a bowl of delicious soup is heated and ready to eat.

Economy Campbell's Soups are inexpensive—an important consideration to those whose budgets are limited.

Recommend Campbell's Soups . . . and, of course, enjoy them yourself. Remember, *there's a soup for almost every patient and diet . . . and for every meal.*

NOW IS THE TIME... TO GIVE HER TIME WITH OVULEN-21®

Each tablet contains ethynodiol diacetate 1 mg., mestranol 0.1 mg.

The new mother needs time . . .
to adjust to motherhood,
to give her new baby all the love
and attention he requires.
She needs time for her husband . . .
and for herself as well . . .
so that she can come to terms
with the increased cares
and responsibilities now facing her.
She needs time to decide
when she will have additional children
and how many she will have.

OVULEN-21®

Each tablet contains ethynadial diacetate 1 mg., mestranol 0.1 mg.

GIVES HER TIME

Your prescription for Ovulen-21 gives the new mother time to meet her family's present needs...to plan for her family's future.

She can take Ovulen-21 confidently and comfortably month after month. Its dependability is enhanced by its simplicity of use. A woman needs little or no time to learn the simple Ovulen-21 regimen: three weeks on—one week off. And the automatic record-keeping of the petite, virtually "patient-proof" Ovulen-21 Compack® helps to maintain her schedule...helps put time on her side.

Immediately post partum is the time

It is the time when motivation is highest—when a new mother needs expert advice for the future, so she can space her children and limit her family.

It is also the most opportune time, since she is conveniently present in the hospital, for her to be given both instructions and a prescription.

Non-nursing mothers may begin Ovulen-21 immediately after delivery, on the day of departure from the hospital or at the first postpartum visit, as desired. It is recommended that nursing mothers begin Ovulen-21 four weeks after delivery.

A small fraction of the hormonal agents in oral contraceptive pills has been identified in the milk of mothers receiving these drugs. The long-range effect on the nursing infant cannot be determined at this time.

Actions—Ovulen acts to prevent ovulation by inhibiting the output of gonadotropins from the pituitary gland. Ovulen depresses the output of both the follicle-stimulating hormone (FSH) and the lutenizing hormone (LH).

Special note: Oral contraceptives have been marketed in the United States since 1960. Reported pregnancy rates vary from product to product The effectiveness of the sequential products appears to be somewhat lower than that of the combination products. Both types provide almost completely effective contraception.

An increased risk of thromboembolic disease associated with the use of hormonal contraceptives has now been shown in studies in both Great Britain and the United States. Other risks, such as those of elevated blood pressure, liver disease and reduced tolerance to carbohydrates, have not been quantitated with precision.

Long-term administration of both natural and synthetic estrogens in subprimate animal species in multiples of the human dose increases the frequency of some animal carcinomas. These data cannot be transposed directly to man. The possible carcinogenicity due to the estrogens can be neither affirmed nor refuted at this time. Close clinical surveillance of all women taking oral contraceptives must be continued.

Indication—Ovulen is indicated for oral contraception.

Contraindications—Patients with thrombophlebitis, thromboembolic disorders, cerebral apoplexy or a past history of these conditions, markedly impaired liver function, known or suspected carcinoma of the breast, known or suspected estrogen-dependent neoplasia, and undiagnosed abnormal genital bleeding.

Warnings—The physician should be alert to the earliest manifestations of thrombotic disorders (thrombophlebitis, cerebrovascular disorders, pulmonary embolism, and retinal thrombosis). Should any of these occur or be suspected the drug should be discontinued immediately.

Retrospective studies of morbidity and mortality in Great Britain and studies of morbidity in the United States have shown a statistically significant association between thrombophlebitis and pulmonary embolism and the use of oral contraceptives. There have been three principal studies in Britain[1-3] leading to this conclusion, and one[4] in this country. The estimate of the relative risk of thromboembolism in the study by Vessey and Doll[3] was about sevenfold, while Sartwell and associates in the United States found relative risk of 4.4, meaning that the users are several times as likely to undergo thromboembolic disease without evident cause as nonusers. The American study also indicated that the risk did not persist after discontinuation of administration, and that it was not enhanced by long-continued administration. The American study was not designed to evaluate a difference between products. However, the study suggested that there might be an increased risk of thromboembolic disease in users of sequential products. This risk cannot be quantitated, and further studies to confirm this finding are desirable. Retrospective studies in Great Britain have shown a statistically significant association between cerebral thrombosis and embolism and the use of oral contraceptives. This has not been confirmed in the United States.

Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn.

Since the safety of Ovulen in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule the possibility of pregnancy should be considered at the time of the first missed period.

A small fraction of the hormonal agents in oral contraceptives has been identified in the milk of mothers receiving these drugs. The long-range effect to the nursing infant cannot be determined at this time.

Precautions—The pretreatment and periodic physical examinations should include special reference to the breasts and pelvic organs, including a Papanicolaou smear since estrogens have been known to produce tumors, some of them malignant, in five species of subprimate animals. Endocrine and possibly liver function tests may be affected by treatment with Ovulen. Therefore, if such tests are abnormal in a patient taking Ovulen, it is recommended that they be repeated after the drug has been withdrawn for 2 months. Under the influence of progestogen-estrogen preparations preexisting uterine fibromyomas may increase in size. Because these agents may cause some degree of fluid retention, conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. In breakthrough bleeding, and in all cases of irregular bleeding per vaginam, nonfunctional causes should be borne in mind. In undiagnosed bleeding per vaginam adequate diagnostic measures are indicated. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. Any possible influence of prolonged Ovulen therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. A decrease in glucose tolerance has been observed in a significant percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving Ovulen therapy. The age of the patient constitutes no absolute limiting factor, although treatment with Ovulen may mask the onset of the climacteric. The pathologist should be advised of Ovulen therapy when relevant specimens are submitted. Susceptible women may experience an increase in blood pressure following administration of contraceptive steroids.

Adverse reactions observed in patients receiving oral contraceptives—A statistically significant association has been demonstrated between use of oral contraceptives and the following serious adverse reactions: thrombophlebitis, pulmonary embolism and cerebral thrombosis.

Although available evidence is suggestive of an association, such a relationship has been neither confirmed nor refuted for the following serious adverse reactions: neuro-ocular lesions, e.g., retinal thrombosis and optic neuritis.

The following adverse reactions are known to occur in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea during and after treatment, edema, chloasma or melasma, breast changes (tenderness, enlargement and secretion), change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately post partum, cholestatic jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals and mental depression.

Although the following adverse reactions have been reported in users of oral contraceptives, an association has been neither confirmed nor refuted: anovulation post treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption and itching.

The following laboratory results may be altered by the use of oral contraceptives: hepatic function: Increased sulfobromophthalein retention and other tests; coagulation tests: increase in prothrombin factors VII, VIII, IX and X; thyroid function: increase in PBI and butanol extractable protein bound iodine, and decrease in T^3 uptake values; metyrapone test and pregnanediol determination.

Fast...long-lasting relief of aches and pains of colds and flu

with the unique timed-release aspirin

Double strength Measurin timed-release aspirin offers a new kind of control for your patients with cold and flu discomforts. In each 10-grain tablet are over 6,000 microscopic reservoirs that release aspirin at a controlled rate—some right away and some later on. This means fast relief of symptoms, followed by hours of comfort. Throughout the day, Measurin gives your patients freedom from a 4-hour aspirin schedule. During the night, its 8-hour dosage schedule holds the promise of sound sleep without awakening to take extra tablets.

ECONOMICAL • EFFECTIVE • LONG LASTING PAIN RELIEF

Dosage: 2 tablets followed by 1 or 2 tablets every 8 hours as required, not to exceed 6 tablets in 24 hours. For maximum nighttime pain relief, 2 tablets at bedtime.

Available: Bottles of 12, 36 and 60 tablets.

Organ and Tissue Donation Made Easier

It would seem that the willing of one's body or any of its organs should be a simple matter. This is particularly so in light of the Uniform Anatomical Gift Act adopted in Maryland in 1968—one of the first states to take such action. However, since its adoption and the initial deluge of requests for appropriate legal forms, interest has waned.

With the development of a uniform card for organ and tissue donation, it seems that most, if not all of the roadblocks toward an individual "giving to the living" have been cleared. The development of such a uniform card was important. Now, when an individual dies in another state, the legality of such a bequest is no longer in question. Uniformity of the law (in 39 states) and uniformity of the legal form itself now makes donation quicker and easier. More important, however, the person should carry the Uniform Donor Card and supplement this with a Medic-Alert ID Tag. Thus, if he should die outside his community, and relatives are not present or aware of the death, prompt identification of the potential donor can be made.

In some cases, organs must be removed within a specified time after death, or their value is impaired. Hospitals and medical personnel are reluctant to move in this direction until the legal right to do so has been clearly established. Without such a donor card and the means to alert hospital or attendants to the fact that the patient is a prospective donor, many organs would be lost to science and the wishes of the donor not carried out.

Public interest in donation can be encouraged.

As a corollary, the agencies below are cooperating in the operation of a Medical Transplant Information Center, with offices at 40 W. Franklin Street, Baltimore, Maryland 21201. Telephone: 539-4355. These agencies are underwriting the expenses of this Center, as well as the maintenance of a Central Registry of donors. The value of this project is being carefully studied in an effort to determine if individual agencies, cooperating in this manner, can stimulate the supply of donations and maintain a ready reference source of information on such donations for the public.

Those wishing to obtain a supply of donor cards should contact:

John Sargeant

Jejunocolostomy For Obesity

Three cases are presented which show that jejunocolostomies resulted in marked weight losses. A 50 cm segment of jejunum was anastomosed to the transverse colon, bypassing the remainder of the small bowel and the ascending colon. Detailed accounts of these cases demonstrated the severe side effects and numerous postoperative complications. After fifteen, seven, and seven months respectively, the jejunocolostomies were revised to jejuno-ileac shunts. Because the purpose of the paper is to demonstrate the problem involved in the jejunocolostomy, the periods following the revisions are developed briefly. The side effects are such that few patients and physicians would be willing to accept them. Though not discussed in this paper, 108 jejuno-ileostomies have been performed by the author on obese patients, and he finds this operation much more acceptable for both patient and physician.

CHARLES E. WILLS, JR., MD
Department of Surgery
Wills Memorial Hospital
Washington, Georgia

Weight losses of 45.4 kg (100 lb) in six to nine months are to be expected with jejunocolostomies in extremely obese patients. However, this is not the whole story. I have often wondered why the number of case reports in medical literature were so few. The largest series reported by I. H. Page, MD, was only 11 cases.[1] J. H. Payne, MD, in his first report in 1963, covered only ten cases. Of these ten, eight underwent additional revisions within a short period of time.[2] Henry Shibata, MD, reported 11 cases.[3] Other reports have generally consisted of only one or two cases,[4-7] and in my discussions with other physicians, frequently I have heard them state that they have performed only one of these operations. After completing only three of them, I believe that I have found the reason for the few number of these operations being performed.

Three extremely obese women had jejunocolostomies for the purpose of weight reduction. All of these patients had had disorders related to obesity that were considered to be major health hazards. The primary operation for all three of these cases was identical. The jejunum was divided 50 cm (20 inches) below the ligament of Treitz. The proximal end of the jejunum was then anastomosed to the transverse colon by an end-to-side anastomosis. The distal end of the jejunum was simply closed upon itself and left as a blind sac.

CASE I

In November 1963, I began treating a 32-year-old white woman whose weight was 103.5 kg (250 lb), and whose height was 222.73 cm (68 inches). Over a period of ten years, she and her physicians had tried many methods of weight reduction, including diets, thyroid tablets, and diet-reducing pills without any success. During this period, she was plagued by a multitude of symptoms including indigestion, abdominal distress, menstrual disorders, fatigue, dysuria, heartburn, insomnia, dizziness, hot flashes, and headaches. She had had only one child. Medication for these disorders gave little relief. Her best treatment consisted of being appointed a foster mother by the state welfare department in which

Case I: November 1964
Weight—127 lb.

Case I: April 1968
Weight—177 lb.

she cared for a large number of children throughout this period. This relieved many symptoms; however, it did not solve her weight problem. So, in November 1963 a jejuno-transverse colostomy was performed, leaving the patient with 50 cm (20 inches) of functioning jejunum. Preoperatively, her cholesterol was 160 mg/100 ml; total protein, 6.4 gm/100 ml; albumin, 3.9 mg/100 ml; and globulin, 2.5 gm/100 ml. Her hemoglobin was 14 gm/100 ml. Within a few days, she was having eight to ten bowel movements a day. In addition, she became nauseated and experienced gas pains in the abdomen. Symptomatic therapy controlled these to some degree.

One month following her surgery, she developed edema of the legs, and her total protein dropped to 5.69 gm/100 ml. Her albumin was 3.1 gm/100 ml, and her globulin, 2.59 gm/100 ml. A high-protein, salt-free diet, oral diuretics, and the wrapping of the legs with Ace bandages relieved this problem within a few weeks. During this period, if the patient had diarrhea, she was not very nauseated; but if she did not have diarrhea, she felt nauseated. The patient was so emotionally motivated by the loss of weight that she was willing to accept these side effects. By the end of nine months, she had lost 52.21 kg (115 lb), and her bowel movements had reduced to four a day. Twelve months after her surgery, her weight was 57.658 kg (127 lb), and for the next three months, it stabilized between 56.75 kg (125 lb) and 59.02 kg (130 lb). Because the patient was very pleased with the procedure, later experience proved to me that she minimized her side effects. She was so proud of herself that her weight loss, to her, overrode the side effects.

Fifteen months after her original surgery, her shunt was revised by a jejuno-ileostomy using 36 cm (15 inches) of jejunum and 25 cm (10 inches) of terminal ileum. This was done in an effort to further relieve her side effects, and to insure her long-term health. At this time, her hemoglobin was only 10.5 gm/100 ml. In preparation for the second procedure, she was given 1000 ml of whole blood. Since this paper is dealing primarily with the jejuno-colic shunt, the remainder of her history will be briefly stated.

Her weight increased progressively to 83.99 kg (185 lb). During the next twelve months, almost all of her undesirable abdominal complaints disappeared. Nausea and gas were very rare, and she had one to three bowel movements a day. Now, five years after her first operation, her weight fluc-

tuates between 72.64 kg (160 lb) and 86.16 kg (190 lb). Her body proteins and cholesterol remain at normal levels. She feels well and has had very little medical treatment of any kind since her revision surgery.

CASE II

In April 1966, a 46-year-old Negro woman came to me as a patient. Her weight was 103.078 kg (227 lb), and her height was 165.10 cm (65 inches). This patient had a very low socioeconomic and educational background. She had been known to be a diabetic for five years, but had not had any complications. When prodded about staying on a diabetic diet and losing weight, she simply smiled. She had a multitude of symptoms, including a feeling of dizziness upon waking at night, pains in the chest, pain in the left knee, swelling in the ankles, dysuria, incomplete emptying of the bladder, indigestion, and others.

In the same month, a jejuno-transverse colostomy was performed, leaving the patient with 50 cm (20 inches) of jejunum. Preoperatively, her cholesterol was 262 mg/100 ml; her total protein, 7.9 gm/100 ml; her albumin, 4.6 gm/100 ml; her globulin, 3.3 gm/100 ml; and her fasting blood sugar, 146 mg/100 ml. Within a few days, she was having six to eight bowel movements a day. On the seventh postoperative day, she was dismissed from the hospital. Three months later, she had lost 19.976 kg (44 lb), and in general, was completely miserable. She had a very sad, depressed appearance. She stated that she was so weak that she could hardly walk. She was unable to eat due to continuous nausea, and she continued to have six to eight bowel movements a day. Her general examination looked considerably better than the impression gained through talking with the patient. Her hemoglobin was 12 gm/100 ml; serum calcium, 4.7 mEq/100 ml; cholesterol, 75 mg/100 ml; potassium, 4 mEq/100 ml; total protein, 6.2 gm/100 ml; albumin, 3.5 gm/100 ml; and globulin, 2.7 gm/100 ml. Her glucose-tolerance test reached only 127 mg/100 ml at its highest point. She was treated for four days in the hospital with vitamin B-12, 50% magnesium sulfate, intramuscularly; diphenoxylate hydrochloride with atropine sulfate (*Lomotil*); glucose with electrolytes, and antibiotics for an abscessed tooth. When

Case II: April 1966
Weight—227 lb.

Case II: November 1966
Weight—127 lb.

discharged from the hospital, her general condition appeared excellent. Following this admission, the patient was seen weekly in the office, and received much symptomatic treatment to relieve the growing list of complaints, including insomnia, loss of appetite, pains in the chest, diarrhea, coldness and weakness in the extremities, and gas on the stomach. She stated, "If I do not eat, I only have three to four bowel movements a day; if I do eat, I may have as many as ten to fifteen."

Five months after the operation, she suddenly became worse, and seemed to be out of her head. When she talked, she did not make sense. She made a grunting noise, and appeared to be acutely ill. By this time, she had lost 24.97 kg (55 lb); her physical condition appeared good, but her mental state did not seem so good. Her hemoglobin had dropped to 10.6 gm/100 ml; her electrolyte studies were balanced. She was given glucose, electrolyte solutions, and sedatives intravenously. Her cholesterol was 92 mg/100 ml; total protein, 6 gm/100 ml; albumin, 3.4 gm/100 ml; and globulin, 2.6 gm/100 ml. After four days of this treatment, she was feeling well and smiling again. She was again followed as an outpatient, and continued to have many of her same previous symptoms. Six months after her surgery, she developed this peculiar behavior again. She seemed disoriented, and attempted to bite anyone who might be nearby. By this time, she had lost 39.044 kg (86 lb). Electrolyte studies obtained before any treatment were within normal range. An attempt was made to relieve the symptoms with no treatment other than sedatives and time. Her mental state did improve, although she continued to feel very badly until she was given large doses of electrolytes and fluids intravenously. Her cholesterol was 64 mg/100 ml; total protein, 6.1 gm/100 ml; albumin, 3.6 gm/100 ml; globulin, 2.5 gm/100 ml; and hemoglobin, 9.8 gm/100 ml. After six days, she was rejuvenated and smiling. Outpatient treatment continued in the same fashion for one more month. She had lost a total of 45.4 kg (100 lb) in seven months, and she showed no evidence of slowing down in her weight loss.

Due to all of the factors involved, I felt that it was necessary to revise her intestinal bypass. On November 28, 1966, the jejunocolostomy was taken down and a jejuno-ileostomy was performed, leaving the patient 33 cm (13 inches) of jejunum and 10 cm (4 inches) of terminal ileum. It was noted at this time, and demonstrated by the biopsies, that the functioning jejunum had hypertrophied in its wall, and that there was muscular atrophy in the wall of the defunctionalized ileum. It was also noted that the 50 cm (20 inches) that were measured at the time of her original surgery had been reduced to 33 cm (13 inches). At the time of this surgery, she was given 1000 ml of whole blood. Her cholesterol was 76 mg/100 ml; total protein, 6.2 gm/100 ml; albumin, 3.45 gm/100 ml; and globulin, 2.75 gm/100 ml. A biopsy of the liver was taken, with a pathological report of fatty metamorphosis.

Following her revision, the patient did exceedingly well. All of the symptoms attributable to the jejunocolostomy disappeared; however, she continues to have two large bowel movements a day. Twenty-four months after her revision, her weight has slowly increased to the present weight of 67.192 kg (148 lb). She is happy and well.

CASE III

In August 1967, I accepted a 39-year-old white woman as a patient. Her weight was 178.876 kg (394 lb), and her height, 167.64 cm (66 inches). Previously, she had had two Caesarean sections and a ventral hernia repair, which broke down. Since her last pregnancy in 1962, she had been known to have diabetes. Following an episode of polio in 1956, her weight climbed to 200.668 kg (442 lb). In 1962, she reduced to 131.66 kg (290 lb) through the use of thyroid tablets, pituitary shots, and diets; however, this quickly increased to the range of 158.90 kg (350 lb) to 181.60 kg (400 lb). She stayed within this range, in spite of the use of diets and pills. She stated, "I lost 40 pounds, and then gained back 60 pounds." She complained of chronic fatigue, cramps and swelling in her legs; she stated that the weight of her abdomen strained her back. Preoperatively, her cholesterol was 259 mg/100 ml; total protein, 6.6 gm/100 ml; albumin, 3.7 gm/100 ml; and globulin, 2.9 gm/100 ml. Her glucose-tolerance test reached a peak at 238 mg/100 ml. At the time of her operation in August 1967, gallstones were found, and her gall bladder was removed. At the same time, a jejunocolostomy was performed, using 90.8 cm (20 inches) of jejunum. The ventral hernia was also repaired with the use of Merseline plastic mesh. Within a few days, she was having ten to twelve bowel movements a day. Two weeks later, necrosis developed in the patient at the lower edge of her incision, and the edges began to separate. In addition, superficial phlebitis in the anterior lateral parts of both thighs appeared.

Three weeks after surgery, a general debridement and secondary closure of her incision was performed. In doing this, a section of skin, 40 cm (16 inches) in length, and as wide as 10 cm (4 inches) in some parts, was excised. She was given 1000 ml of whole blood and treated with antibiotics. The incision healed very slowly. After a total of 40 days in the hospital, she was allowed to go home. She complained considerably of nausea and weakness, and had three to four bowel movements a day. She became depressed and wanted to have the operation revised to establish normal intestinal continuity. Two months after her surgery, she had lost 31.78 kg (70 lb), and was back in the hospital in

an effort to relieve the cause of her complaints. Her cholesterol was 108 mg/100 ml; fasting blood sugar, 85 mg/100 ml; potassium, 2.5 mEq/100 ml; total protein, 5.5 gm/100 ml; albumin, 2 gm/100 ml; and globulin, 3.5 gm/100 ml. She was treated with electrolytes and fluids given intravenously, and was ready to go home again after a week. Three weeks later, she was back in the hospital, complaining of weakness, nausea, and the inability to eat. She was nervous, and felt as if she wanted to climb the walls. She began to have crying spells, but did not know why she cried. She was fidgety and could not sleep, in spite of as much as 6 grains of secobarbital (*Seconal*) at night. Her hemoglobin was only 8.5 gm/100 ml. She had a positive urine culture for proteus vulgarius. Her calcium was 4.1 mEq/100 ml; potassium, 3.1 mEq/100 ml; total protein, 4.7 gm/100 ml; albumin, 1.75 gm/100 ml; and globulin, 2.95 gm/100 ml. By this time, she had lost 38.85 kg (88 lb). The urinary tract infection proved to be chronic pyelonephritis. She was again treated with blood transfusions, electrolytes, antibiotics, and fluids given intravenously. After ten days in the hospital, she returned home.

This period at home lasted for approximately one month, during which she developed severe rectal itching. By this time, she had lost 48.12 kg (106 lb). Her total protein was 5.5 gm/100 ml; albumin, 2.7 gm/100 ml; globulin, 3.2 gm/100 ml; calcium, 4.2 mEq/100 ml; and potassium, 2.7 mEq/100 ml. A heavy vaginal discharge was found to be due to Trichomonas vaginalis. This was successfully treated with diiodohydroxyquin compound (*Floraquin* vaginal suppositories). Sigmoidoscopic examination revealed large internal hemorrhoids, and symptomatic treatment for the rectum was given. Again, she went home after 11 days in the hospital. The rectal itching and hemorrhoids continued to disturb the patient greatly, and much of the itching became painful. Three weeks later, she was admitted to the hospital for a hemorrhoidectomy. At her request, a large area of redundant skin and subcutaneous tissue 45 cm (18 inches) long, 20 cm (8 inches) wide, and 7½ cm (3 inches) deep was excised from the right side of the abdominal wall. Following this surgery, her hemoglobin was only 10.1 gm/100 ml, and she was given 1000 ml of whole blood. It was also noted that, despite repeated treatment, the urine culture continued to be positive. Following her hemorrhoidectomy, she had very little rectal control, even though a sphincterotomy had not been performed. This, along with continual diarrhea, left her in a generally unhappy state. Nevertheless, she was pleased with her weight loss, which at this time was 53.57 kg (118 lb). After 24 days in the hospital she was discharged.

She returned to the hospital in a week, complaining that she had no appetite and was not eating.

Case III: August 1967
Weight—394 lb.

Case III: March 1968
Weight—270 lb.

Every time that she did eat, she had diarrhea, soiling so many of her clothes that everyone in her home was very unhappy with the situation. Again she was treated with sedatives and fluids given intravenously. At this time, the patient and I felt that it was time to revise her bypass to a jejuno-ileostomy. Her weight had dropped to 122.58 kg (270 lb), with a total weight loss of 56.30 kg (124 lb) in seven months. On March 25, 1968, her jejuno-transverse colostomy was taken down and her bypass was revised to a jejuno-ileostomy, leaving her with 35 cm (14 inches) of jejunum and 10 cm (4 inches) of terminal ileum. It was noted that the segment of jejunum that had been previously measured at 50 cm (20 inches) was only 40 cm (16 inches) in length. A liver biopsy was performed, with a pathological report of fatty metamorphosis. Preoperatively, her total protein was 4.4 gm/100 ml; albumin, 1.7 gm/100 ml; and globulin, 2.7 gm/100 ml. She was also given 500 ml of plasma and 1500 ml of whole blood, during the first few days following her surgery. She did exceptionally well, having only two to three bowel movements a day with good bowel control. Within a few days, she was not taking any sedatives. Plans were made for her discharge from the hospital on the tenth postoperative day; however, on the ninth postoperative day, she suddenly developed a massive pulmonary embolus, and died in spite of resuscitative efforts. An autopsy revealed the pulmonary embolus and both chronic and acute pyelonephritis. This patient spent a total of 126 days in the hospital during a period of about 7½ months. During this time, she received a total of 6000 ml of blood.

Metabolic Effects

All of these patients developed anemia to some extent. The first two received only 1000 ml of whole blood; however, the third patient received 6000 ml of whole blood. This anemia in the third case could have been caused partially by chronic pyelonephritis. Preoperatively the cholesterol in all three cases was near the normal level, and following the jejunocolostomy, had a marked drop to levels between 60 mg/100 ml and 110 mg/100 ml. All three cases had normal values of serum protein before operation, and all three dropped to below normal levels after the surgery. In Case I and Case II, this drop was equally divided between albumin and globulin. In Case III, most of the drop was in the albumin fraction, which was reversing the A/G ratio. Cases II and III had mild diabetic curves before surgery. Case II had a normal flat glucose-tolerance test following her surgery. Case III had low normal fasting blood sugars postoperatively.

Complications

Case I. Protein deficiency and anemia.

Case II. Protein deficiency, anemia, and psychotic episodes.

Case III. Wound infection, acute thrombophlebitis, calcium and potassium deficiencies, protein deficiency, anemia, depression, thrombosed hemorrhoids, acute and chronic pyelonephritis, rectal incontinence, and pulmonary embolus.

Conclusions

1. Patients will lose weight drastically with the jejunocolostomy;

2. Mild to moderate nutritional deficiencies will result frequently;

3. Side effects are such that very few physicians and patients will be willing to accept them;

4. Jejuno-ileac shunts are much more acceptable to both patient and physician than the jejunocolostomy. Although jejuno-ileac shunts have not been discussed in this paper, the author has had experience with 108 of these cases.

The following Surgical Grand Rounds were presented at the Med-Chi Annual Meeting in April 1969. George D. Zuidema, MD, Professor of Surgery and Chairman of the Department at The Johns Hopkins University School of Medicine, served as moderator.

Case 1

Dr. Zuidema: We would like to present, for your consideration, four separate clinical cases. Each case will be presented by one of our assistant residents and will be discussed by a member of our staff. The first case concerns a patient with carcinoma of the lung. The case will be presented by Dr. Bertram Zarins and will be discussed by Dr. Robinson Baker.

Dr. Zarins: A 57-year-old Peruvian businessman was admitted to The Johns Hopkins Hospital in December 1968 for evaluation of a chest mass noted on routine examination several weeks earlier. The present illness was discovered when the patient consulted his local physician in Lima, Peru for headaches he had been having for the past four years. A chest X-ray was taken which revealed a mass in the right lung. He was referred to The Johns Hopkins Hospital for further evaluation and treatment.

His symptoms on admission to the hospital included headaches, vague chest discomfort, intermittent paresthesias in the right ulnar distribution, and a chronic morning cough which produced yellow sputum. He had been smoking two packs of cigarettes a day for the past 14 years.

His past medical history included treatment by gastrojejunostomy for peptic ulcer disease 30 years ago and treatment by a hemigastrectomy 15 years ago.

Results of a physical examination on admission were relatively normal. Chest X-ray showed a right paratracheal mass extending into the right upper lobe posteriorly. Sputum cytology was positive for a poorly differentiated adenocarcinoma. Pulmonary function tests revealed a forced vital capacity of 87% and an FEV-1 of 82%. The neurological workup for metastatic disease was negative. A right scalene node biopsy was done and this was negative for metastasis. Thus, with a presumptive diagnosis of carcinoma of the right upper lobe, a posterolateral thoracotomy was performed. This revealed a tumor of the right upper lobe involving the right upper lobe bronchus. A right upper lobectomy was performed. The histologic diagnosis was bronchiolar carcinoma with clear margins; vascular invasion was evident.

The patient developed atrial fibrillation on the second postoperative day with an atrial rate of 400 and a 2:1 block. This was treated with digitalis, xylocaine and quinidine, and his rhythm reverted to normal on the fifth day. The remainder of his postoperative course was uneventful. The patient was discharged two weeks postoperatively and returned to Peru.

Radiology and Pathology Reports

Dr. Goldenberg: A single frontal view of the chest showed a soft tissue mass in the right paratracheal and superior area of the right hilum. There was no calcification in the mass. On the lateral film, this mass could be seen to extend into the posterior aspect of the right upper lobe. In summary, the X-ray revealed a soft tissue mass which is most likely carcinoma.

Dr. Bieseker: We received in the laboratory a right upper lobe. Extending to within approximately 1 cm of the bronchial margins was a 6 cm mass. On section, this mass was quite firm and somewhat gelatinous. The tumor mass extended toward the periphery of the lung, but it was difficult to tell exactly how close it was to the periphery because it was associated with a large amount of atelectasis. The bronchial margin was negative. There was one large parabronchial lymph node present.

The cytologic smears revealed several poorly differentiated cells. There were strings of mucous and many polymorphonuclear cells interspersed within the cancer cells. The tumor cells were characterized by large hyperchromatic nuclei with a large dimple in one side of the nucleus. The clumped chromatin and vacuoles within the cytoplasm are also characteristic of poorly differentiated carcinoma. Thus, the cytologic diagnosis of a poorly differentiated adenocarcinoma was made.

The next section showed a typical bronchiolar carcinoma with the alveoli preserved but lined with anaplastic cells. There was a moderate amount of mucous production and most of the cytoplasm of these cells was filled with mucous showing the typical picture of a moderately anaplastic bronchiolar carcinoma. A higher power view of the specimen showed multiple cells with mitotic figures which also exhibit other characteristics of malignancy, such as pleomorphism, and large irregular nuclei.

In many areas of the tumor, there was evidence of vascular invasion. The wall of both arteries and veins were invaded and on several sections, anaplastic cells similar to the cells seen in the primary tumor were noted within the lumen of smaller arteries and veins.

The large peribronchial lymph node was also sectioned, and under the microscope, pleomorphic anaplastic cells lining the subcapsular sinuses of the lymph node were visible.

In summary, the tumor, a bronchiolar carcinoma which is moderately well differentiated in some areas but quite anaplastic in other areas, is producing a large amount of mucous. The aggressive potential of the tumor is demonstrated by its ability to invade vascular spaces and also to metastasize to the regional lymph nodes.

Discussion

Dr. Baker: Carcinoma of the lung is the most common malignancy in males today. It causes approximately 300 deaths in the United States per day. Surgery offers the best chance of cure, but only one third of those patients admitted to a large general hospital are candidates for surgical excision. I intend to discuss the evaluation of a patient with a potential carcinoma of the lung.

We have tried to develop a method of accurately working up these patients which can be accomplished as rapidly and inexpensively as possible. The first thing is to establish a tissue diagnosis. The cheapest and simplest way for the patient is by cytology. If this is not effective, we then proceed to bronchoscopy and, at the same time, ask the bronchoscopist to biopsy the carina to establish the local extent of the tumor, as well as to establish the histologic type.

If the cytologic and bronchoscopic studies are negative, we then proceed with a scalene node biopsy with a tumor of this size. For a smaller coin lesion, ie, a circumscribed mass less than 5 cm in diameter, a scalene node biopsy has not proved to be of great use since the results are almost routinely negative.

Once the histologic diagnosis is established, we like to determine, if possible, the presence and extent of mediastinal spread. The first method is by history. If the patient has any evidence of hoarseness, this indicates that one of the recurrent laryngeal nerves is paralyzed and we try to confirm this by direct laryngoscopy. The next step is to try to determine if the phrenic nerve and the esophagus are involved by the tumor mass. Chest fluoroscopy and a barium swallow are the most accurate means of determining

either phrenic nerve paralysis or direct invasion of the esophagus.

We then proceed with bronchoscopy if it has not already been done as part of the original workup for a tissue diagnosis. The bronchoscopy is performed to establish the extent of local spread of the tumor along the main stem bronchus.

A relatively new technique, azygous venography, has proved to be useful in evaluating the extent of mediastinal involvement by large tumors near the hilum on the right side. Thus far in our experience, if the azygous vein is blocked this indicates inoperability. Exploration of the mediastinum is the last step to be included. It is not necessary in a large number of cases but is indicated in some selected cases. The mediastinum can be explored by a variety of methods. Probably the most popular is mediastinoscopy, accomplished by a small incision at the base of the neck which is extended through the strap muscles to the trachea. Dissection is carried out along the trachea and it is then possible to introduce a modified laryngoscope or mediastinoscope to visualize various structures within the mediastinum. Perhaps the best method of exploring the mediastinum is a short anterior incision into the side of the chest involved. This is the safest and most diagnostic test. In our experience, it can be accomplished without morbidity and allows a much better mediastinal exploration than can be accomplished by mediastinoscopy.

Once we have satisfied ourselves that there is no local extension into the mediastinum, we then proceed with diagnostic studies designed to determine the presence of distant metastasis. I think our experience and that of a number of other centers has shown that routine scalene node biopsy is not indicated. Of course, scalene node biopsy is indicated if a node is palpable. It is also indicated if you establish a cytologic or histologic diagnosis of an oat cell carcinoma. Such patients have the lowest chance of cure and the highest incidence of metastatic spread to the scalene nodes. But in other cases such as a squamous cell carcinoma, adenocarcinoma, or bronchiolar carcinoma, routine scalene node biopsy in the absence of palpable nodes is not indicated if the lesion is less than 5 cm in diameter. We like to screen the liver for metastatic disease by obtaining an alkaline phosphatase and BSP. If either of these is abnormal, we then proceed with a scintiscan of the liver.

Routine bone surveys and brain scans are not indicated. We only proceed with a brain scan, bone survey, or strontium scan of the bone if these show clinical signs that lesions might be present. In this particular patient, a brain scan was performed because of his history of headaches. This was interpreted as normal.

Once we are satisfied that there is no evidence of distant metastasis, we proceed with some pulmonary function studies. These pulmonary function studies can be very simple. The patient who has no symptoms of respiratory insufficiency, who can walk up two flights of stairs without difficulty really needs no pulmonary function studies. Although we have routinely performed a vital capacity test and measured how much air he can get out in the first second, this is probably not necessary if he has no evidence of obstructive airway disease on physical examination. If these tests are normal, we then proceed with a thoracotomy.

If the patient does have any symptoms of pulmonary insufficiency, or on physical examination shows evidence of obstructive airway disease, we then proceed with more sophisticated pulmonary function studies. Diffusion defects are perhaps best measured by carbon monoxide studies; perfusion defects are measured by quantitative pulmonary scintiscans. Differential bronchospirometry has been abandoned in our institution as a routine procedure.

This diagnostic workup is performed to determine if there are any specific contraindications to thoracotomy. The first contraindication to thoracotomy is local extension of the tumor as evidenced by a positive carinal biopsy. Mediastinal extension as detected by recurrent nerve palsy or perhaps phrenic nerve palsy, is another sign of inoperability. Superior vena caval obstruction is certainly a contraindication. Esophageal invasion or direct extension of the tumor into the mediastinum, as evidenced by exploration of the mediastinum, are also specific contraindications, as is obstruction of the azygous vein. Pleural extension as shown by a bloody pleural effusion or cytologically positive pleural effusion is another indication that the tumor has extended beyond the scope of surgical resection. The presence of distant metastases as indicated by a positive scalene node biopsy, or the presence of metastatic disease in the liver, bones, or brain are also specific contraindications.

Case 2

Dr. Zuidema: The second case deals with a patient with a hiatal hernia. The case will be presented by Dr. Mark Orringer.

Dr. Orringer: This was the first Johns Hopkins Hospital admission for a 46-year-old white male shoe factory worker, who was admitted to the surgical service of Dr. David Skinner for evaluation of his abdominal pain after eating, especially when assuming the recumbent position, a problem which had occurred for approximately two years.

The past medical history is significant only in that the patient was admitted to a veteran's hospital for what he termed a rapid heart rate which subsided spontaneously, required no treatment, and was resolved without any sequela. The patient's family history revealed arteriosclerotic heart disease in both parents, peptic ulcer disease and some form of

intra-abdominal malignancy in two siblings. The social history was also significant: The patient used neither alcohol nor cigarettes.

The history of present illness dated back two years prior to admission when the patient first began to experience left upper quadrant and epigastric dull aching pain after eating, especially when lying down or leaning far forward. This was also accompanied by regurgitation, eructations, and substernal burning. These symptoms progressed in severity and finally, two months prior to admission, he consulted his local physician who advised an upper GI series. This study demonstrated no evidence of an ulcer, but uncovered a hiatal hernia. As a result, the patient was placed on a regimen of antacids and was elevated at the head of his bed. However, his symptoms did not subside and in fact grew worse until, at the point when he was referred to our center for evaluation, he was experiencing almost nightly insomnia from the frequency of his regurgitation.

The patient gave no history of fatty food intolerance, jaundice, or dark-colored urine or acholic stools. He had never experienced hematemasis or melana. His bowel movements had been regular and his weight had remained constant throughout.

On physical examination the only pertinent finding was limited to the abdomen, which was obese with the left upper quandrant and epigastric tenderness to depalpation without rebound or guarding. The bowel sounds were normal and active. Rectal examination was normal, and there were no masses or tenderness. Stool guaiac was negative. Admission laboratory studies included a hematocrit of 42%, and normal white blood cell count, urinalysis, chest film, electrocardiogram, electrolytes, and liver function tests.

The preoperative evaluation of this patient's hiatal hernia was centered around four main studies. The first of these was an acid-barium esophagogram. This demonstrated normal esophageal motility with conventional barium. However, a sliding hiatal hernia with reflux was clearly demonstrated. Upon the administration of acid-barium, there was marked disturbance of esophageal motility with segmental spasm and pooling of barium within the esophagus. This reversed back to normal motility after antiacids were administered and the study was repeated with conventional barium.

The second study performed was esophagoscopy. This demonstrated a patulous cardia with free reflux and no gross evidence of esophagitis. This impression was borne out by biopsy of the esophagus at a point 5 cm above the gastroesophageal junction, which was also negative for esophagitis.

The third group of tests are combined under the term "esophageal reflux tests". Here there was no evidence of a high pressure zone in the lower esophagus on pulling back the pressure recording tube from the stomach into the esophagus. There was evidence of reflux on the pH withdrawal or Tuttle test, as pulling back the pH probe from the stomach where a pH recording of 1.9 was found; into the esophagus 5 cm into the chest still gave a pH reading of 2.1. And this low reading persisted for at least 20 cm up into the esophagus. Finally, the acid clearing test demonstrated that the patient was unable to clear acid well from his esophagus. With repeated swallows, he was only able to lower the pH to a range of 3.

The final test performed was a Bernstein perfusion test where perfusion of the esophagus with saline caused no symptoms. Perfusion with one-tenth normal hydrochloric acid produced retrosternal burning and symptoms similar to those that the patient had experienced. Reinfusion with saline brought alleviation of these symptoms.

As a result of these studies, the patient was taken to the general operating room with a diagnosis of symptomatic hiatal hernia with reflux. Through a left thoracotomy, the cardia of the stomach was reconstructed. The postoperative course was complicated by one episode of paroxysmal atrial tachycardia which responded to digitalis, and with some right lower lobe atelectasis which responded to vigorous cough therapy and postural drainage.

Prior to discharging the patient, several of the studies which the patient had had preoperatively were repeated, including a postoperative acid-barium esophagogram. This still showed that there was some motility disturbance with acid barium, but it must be remembered that this was done only nine days postoperatively. The significant point was that there was no longer a hiatal hernia or reflux demonstrated. A repeat of the acid clearance test and the Bernstein test was still slightly positive, although less so than preoperatively. The pressure recording postoperatively clearly demonstrated that there was a lower esophageal sphincter present. This relaxed on swallowing. So, there was a clear sphincter mechanism in the lower esophagus that had not been present preoperatively. PH electrode withdrawal from the stomach and pH monitoring in the esophagus demonstrated no evidence of gastroesophageal reflux.

Dr. Goldenberg (in discussing the radiological findings): X-rays showed a hiatal hernia above the diaphragm, with some reflux of barium from below the diaphragm to above the diaphragm.

Acid was administered causing reflux and a sensitive esophagus that responded to the acid with unusual spastic contractions. In the initial swallows with neutral barium, there was a smooth peristaltic wave. However, the primary peristaltic wave was disorganized.

The administering of antiacid produced a smooth peristaltic wave similar to the initial swallow with neutral barium.

Management

Dr. Skinner: This patient obviously had an extensive workup, but for good reason, I think. The problem of hiatal hernia is a very common one and it is becoming increasingly more important to sort out those patients with a pathologically significant hernia from those whose hernia is just a normal variant in the general population. In the radiological literature, it is reported that 10% to 60% of upper GI series reveal a hiatal hernia, so that the presence of a hernia by itself is relatively insignificant. Therefore, we have become increasingly concerned with putting the patients with a hernia into separate categories of those with reflux and those without because the essence of this problem is gastroesophageal reflux which causes such complications as esophagitis, aspiration, bleeding, and stricture formation.

Accordingly, we have gone to considerable lengths to develop tests to diagnose reflux as opposed to hiatal hernia, and to try and measure the amount of reflux. These tests will be used as a guide in administering surgical or medical therapy, or in judging the results of the treatment, whether it be surgical or medical. I would like to discuss a few of the details of the tests that were performed on this patient, the conditions indicating surgery, and the results of surgery using the type of procedure that was performed in this case.

The esophageal reflux tests use a pressure-monitoring tube in the lumen of the esophagus and a pH electrode that is passed into the stomach and withdrawn into the esophagus. In normal people we can identify a lower esophageal sphincter manifest by an increased resting pressure. We then pass a pH electrode and measure the gastroesophageal pH gradient which should be very sharp with a rise in pH from one to five or six over a 1 cm distance at the cardia. This patient had no gradient whatsoever. We then put a standard 3 oz of 0.1 N HCl into the stomach, position the pH electrode above the sphincter, and monitor the reflux by pH recordings in the esophagus, while the patient performs a variety of maneuvers.

A tracing of a normal lower esophageal sphincter shows intragastric resting pressure and a rise in pressure as the tube passes through a high pressure zone, and then a drop to the negative intrathoracic environment. This high pressure barrier between the stomach and esophagus somehow prevents reflux. In the patient's tracing, this was perfectly flat with no rise at all before dropping in the thorax; so there was no evidence of sphincter function preoperatively.

We consider a drop in pH at the thorax to be indicative of significant gastroesophageal reflux. Reflux is measured by the number of drops in pH and the persistence of low pH in the esophagus. This patient's pH stayed in the acid range throughout the entire study. Multiple drops in pH indicate an abnormality of the cardia which commonly occurs with hiatal hernia, but may occur in the absence of hiatal hernia.

We have found that people who are in danger of developing complications from their reflux will have abnormal clearing of acid from the esophagus. If we put 15 cc of hydrochloric acid in the mid-esophagus and ask the patient to swallow, the normal patient will raise his esophageal pH progressively with each swallow in a step-like fashion and bring the intraesophageal pH from one to five or six in less than ten swallows. This patient took more than 20 swallows before we stopped the test, as he had no rise in pH at all. We feel that the prolonged persistence of acid material in the esophagus contributes to the likelihood of esophagitis and further contributes to the risk of developing the complications of esophagitis, stricture, bleeding, or aspiration.

Severe symptoms which have not been controlled by medical therapy are the most common indication for surgery, and this was the case with our patient. In addition, patients who have esophagitis to the extent of ulcer formation or bleeding should be operated upon promptly, since there is some risk of developing stricture. Patients with aspiration into the lungs should be operated upon to control their reflux. The operation should be designed to control as many of the various theoretical mechanisms as possible that control reflux. So the operation which can be performed either transthoracically or transabdominally preserves the intrinsic sphincter or restores it. In this patient's case, the surgery created an intra-abdominal segment of esophagus, exaggerated a gastroesophageal angle, reapproximated the diaphragm, and preserved the vagal nerve function.

The type of operation performed was the Mark IV procedure proposed by Ronald Belsey of Bristol, England. The results of hiatal hernia repair in a series which was reviewed several years ago indicate that if we combine mortality, known recurrences (either symptomatic or asymptomatic), poor symptomatic results without evidence of recurrence, and patients lost to followup, and label this entire group as failures of surgery, 85% of the patients known to have anatomic and symptomatic correction of their reflux are not included. This type of surgery is then classified with the same general level of success as we would expect to find in patients receiving surgery for ulcer disease and other benign gastrointestinal conditions.

This patient's acid reflux test postoperatively was completely normal, and his acid clearing maneuver had returned to normal. However, he still showed some sensitivity of the esophagus on the Bernstein acid perfusion test, and this was also evidenced in another study performed by Dr. Goldenberg.

Dr. Goldenberg: In this case, a normal swallow with neutral barium showed no evidence of hiatal hernia, as in the previous case. There was no reflux from below the diaphragm to above the diaphragm, as was previously noted. Also, a smooth primary peristaltic wave was recorded.

With the administration of acid, there was a minimal disorganization of the primary wave, but much less so than on the preoperative study. Throughout this whole study, which probably contained 15 swallows, there is no evidence of reflux and no hernia.

Dr. Zuidema: Dr. Skinner, I assume you feel that the essential ingredient in the repair of the hiatal hernia and the elimination of the symptomatology is the creation of a valve-like mechanism at the cardioesophageal junction. Would you comment on the Mark IV operation and compare it with other techniques for reinstituting or reconstituting this valve?

Dr. Skinner: The upper end of the stomach and a segment of the lower esophagus below the diaphragm that remained empty throughout most of the swallowing phase were definitely visible. This esophagus was obviously compressed and the restoring of a segment of the esophagus to an intra-abdominal pressure environment which has an elevated pressure around the outside of the esophageal segment contributes to the compression and control of reflux. In addition, we bring the diaphragm around the lower esophageal segment and wrap a cuff of stomach around the anterior portion to complete the compression of the segment.

There are several types of hiatal hernia repairs that are frequently used to accomplish the same purpose. All share the same principles, however, in that they restore an intra-abdominal segment of esophagus and create some type of gastroesophageal flap valve mechanism.

The physician, in using the Belsey Mark IV repair, sutures a cuff of stomach to the anterior aspect of the esophagus and closes the diaphragm posteriorally to complete the ring of compression around the lower esophageal segment. It is held below the diaphragm like a cork in a bottle; the mass of reconstructed stomach and esophagus are held together below the narrowed hiatus.

The fundoplication of Nissen accomplishes almost exactly the same thing, and this is easier to perform from below the diaphragm through an abdominal incision. In the Nissen operation, the stomach is wrapped 360 degrees around the lower esophageal segment, which is again fixed on the underside of the diaphragm to prevent it from sliding back up into the chest.

The operation performed by Dr. Hill in Seattle accomplishes the same thing by lashing the gastroesophageal junction to the origins of the diaphragm at the aortic hiatus, thus reducing a long segment of intra-abdominal esophagus and allowing the fundus of the stomach to roll up onto the esophageal segment.

There are several other variations, but in this day and age, any operation performed to repair a hiatal hernia or reflux should incorporate these technical principles in the repair if good results in terms of protecting the patient from reflux and its complications are to be obtained.

Dr. Zuidema: I was quite impressed by Dr. Hill's results in 160 cases without a recurrence. Would you comment on the relative frequency of good results with the different procedures?

Dr. Skinner: It is hard to compare series done in different institutions and followed by different techniques. I think that in terms of recurrence rates, the Hill, Nissen, Husfeld, and Belsey type of repairs produce greater than 90% to 95% success. Dr. Hill's reported lack of recurrences is the best recurrence rate currently in the literature and his results are certainly good. I think the operation he proposes has very valid principles and is probably the easiest operation to perform from an abdominal approach to the hiatus.

Dr. Zuidema: Dr. Skinner, we also encounter the occasional patient who has symptoms of reflux without the presence of hiatal hernia. I think that this particular kind of patient may be a problem diagnostically as well as therapeutically.

Dr. Skinner: There are a number of patients that for years have complained of dyspepsia, indigestion, globus hystericus, or atypical coronary artery disease and have been diagnosed as such, who seem to have a normal upper GI tract because their X-rays are normal. We find that of those patients that we now have identified as being troubled with reflux problems, approximately 20% of them will not show a hiatal hernia by X-ray. So this led to the use of more sensitive tests for reflux, such as the one that we described in some detail with the pH electrode.

A patient who presents symptoms that suggest reflux, but who has a normal X-ray study, should not be dismissed as having a normal upper GI tract until some kind of reflux test is done, whether it be a cine barium study (more accurate than conventional X-ray) or a pH electrode reflux test (slightly more accurate than the cine studies). This kind of patient can be relieved of his reflux problems by the same kind of operation that we have discussed, since this operation is designed to prevent reflux, rather than just reduce the hernia.

Question from the Floor: Should pyloroplasty and vagotomy be done as part of hiatal hernia repair?

Dr. Skinner: Vagotomy and pyloroplasty or gastrectomy and vagotomy are championed by a number of people for reflux problems. I feel that if you perform an operation to prevent gastric contents

from reaching the esophagus, then there is no reason for concern about the amount of acid in the stomach, since it cannot reach the esophagus anyway. So we reserve vagotomy and pyloroplasty or vagotomy and gastrectomy for those patients who have *bona fide* indications for ulcer surgery. And, about 10% of patients with hiatal hernia will have coexistent ulcer disease. In such patients, I perform a vagotomy and gastric procedure. But we do not use it in the other patients.

We have collected a series of cases on patients who have developed symptoms of reflux and esophagitis *after* they have had a previous gastrectomy or pyloroplasty and vagotomy performed, so that reduction of acid alone without doing anything to the cardia is not good treatment for a hiatal hernia and reflux problems.

Question from the Floor: Dr. Skinner, what is the current position of doing the Allison repair or approximating the diaphragm? Is that still necessary?

Dr. Skinner: We certainly approximate the crura in all the types of repairs that we are discussing today. This provides the posterior buttress and prevents the reconstruction of the cardia from sliding up into the chest. The Allison repair is still one of the most common repairs done. However, we have had a chance to study several patients with the Allison repair, and there are several large series of patients reported in the literature who have had tests for reflux. The Allison repair has not been as effective in preventing reflux, even though it has succeeded in reducing the hernias. We feel that you must do something more than the Allison repair and closure of the hiatus. You should add some kind of reconstruction of the cardia to the procedure. The Allison repair has a recurrent rate of reflux of about 25% to 30%, whereas the hernia recurrences are much less frequent. Once again, you can have reflux without a hernia.

Case 3

Dr. Zuidema: The third case concerns a patient with peripheral vascular disease. The case will be presented by Dr. Brent Horsley.

Dr. Horsley: B.G. is an 81-year-old white woman who presented herself to The Johns Hopkins Hospital for the first time on the service of Dr. Robert Rutherford complaining of a "blister on the artery in her stomach". The family history was significant, in that her 56-year-old son had been recently evaluated and treated at our hospital for claudication and probable angina pectoris.

The patient herself was in very good health for her age. She had had two major operations in the recent past—a vaginal hysterectomy with anterior and posterior repair in 1956, and a cholecystectomy in 1962.

The review of systems was significant in revealing the following cardiac symptoms: occasional palpitations, one-and-a-half flight dyspnea on exertion, and three times nocturia but no angina, orthopnea, or pedal edema. She had had hypertension which had been treated for the past three years with 50 mg of a combination of two antihypertensive agents (*Hydropres*) per day.

Radiographic examination of her gastrointestinal system showed a hiatal hernia, with mild symptoms for which she had been treated with phenobarbital and banthine. An earlier barium enema revealed diverticulosis of the colon. Finally, she had had some syncopal episodes without localizing signs.

The patient dated the onset of her present illness approximately one year prior to her admission to The Johns Hopkins Hospital, when she had begun to notice some pain in her left lumbar area or flank. She experienced this pain most frequently two to three hours after eating. There was no associated anorexia, weight loss, or changes in bowel function.

She presented herself to her local physician with this complaint of pain. During his evaluation, a questionable pulsatile mass in the left upper quadrant was felt. Because of the consideration of an abdominal aortic aneurysm, the patient was referred to Dr. Rutherford for definitive evaluation and consideration of surgery.

Physical examination revealed an elderly lady who was mentally alert and physically active. Her vital signs were normal, with the exception of a blood pressure of 170/90. The heart and lungs were within the normal limits for this age. There was a soft systolic ejection murmur in the aortic area. Abdominal examination revealed a pulsatile, slightly tender mass in the left upper quadrant which was hard to outline because of her obesity. She had no organomegaly, and except for the scar of her previous cholecystectomy, the remainder of the abdominal examination was negative.

Her peripheral vascular examination was essentially normal. Pulses in both the upper and lower extremities and the neck were full and equal.

Laboratory studies revealed routine hematologic and chemistry studies to be within normal limits. The electrocardiogram showed a left bundle branch block and the suggestion of an old anterior myocardial infarction, but no acute ST or T wave changes. Radiographic studies revealed a calcified saccular aneurysm about 7 cm in diameter in the lower aorta between the level of the renal arteries and the aortic bifurcation.

The patient was taken to the operating room. The abdomen was opened through a long midline incision revealing the aneurysm. The aneurysm was resected, and the posteromedial wall was left attached to the inferior vena cava. The specimen was saccular in form and partly filled with laminated clot. Aortic continuity was restored by bridging the

defect from about 7 cm below the renal arteries to the aortic bifurcation with a dacron prosthesis sutured in place with running OO Teodek. The patient's postoperative course was uneventful.

Dr. Goldenberg (in discussing the patient's X-rays): A frontal view of the abdomen shows the renal shadow, and there is another soft tissue shadow and a soft tissue mass with some calcification which looks like the aorta. There is another small calcification about the periphery of the soft tissue mass. A lateral view of the mass shows the outline of the aorta as it merges with poorly defined soft tissue mass.

From an upper GI series, calcification can be seen. Below this is a soft tissue mass with peripheral calcification representing a saccular aneurysm protruding anteriorly from the aorta. As previously mentioned, the diameter of this aneurysm was approximately 7½ cm.

A high translumbar aortogram showed the aneurysm beginning well below the take-off of the renal arteries. Another showed the aneurysm ending with good runoff at the aortic bifurcation. Once again, the lateral view of the same study compared the apparent diameter of the aneurysm on plain film with that demonstrated by the aortogram. The discrepancy in diameter probably represents a clot in the anterior portion of the saccular aneurysm.

Discussion

Dr. Rutherford: This particular patient was chosen because she illustrates a number of points which reflect current concepts in the management of primary abdominal aortic aneurysms.

First, the patient's diagnosis was suspected on physical examination and was confirmed by plain films of the abdomen, including a cross-table lateral. How often can one make the diagnosis on these studies alone? We do not have much exact information on this, although it is quite frequent. There is one study by Robb that reports that 89% of the cases of abdominal aortic aneurysms had a calcific outline or a soft tissue tumor or mass on the plain films of the abdomen. Some physicians have even been willing to rule out the diagnosis of aneurysm if these films are negative. However, in our experience at Hopkins, we do not feel that these plain films of the abdomen, including the cross-table lateral, are as commonly diagnostic, particularly in the younger patients. We have seen three young patients this year who have not had a calcific outline. We are presently exploring the use of tomography to increase this yield.

On the other hand, if there is a calcific aortic outline and there is no widening, you can safely exclude the diagnosis of aortic aneurysm.

Next, one might question the need for translumbar aortography here, since the diagnosis was established on plain films, and instead be concerned about its risks, particularly in the presence of an aneurysm. We now do translumbar aortography quite a bit higher up and insert a teflon catheter through the needle, which is a much safer technique.

In this particular patient, aortography was done because of her age and obesity. If we had found either a small fusiform aneurysm or a large aneurysm that extended above the renal arteries, we would have been dissuaded from surgery.

The indications for surgical resection of abdominal aortic aneurysms were not very controversial a decade or so ago, because there had been several reports which indicated that two thirds of all patients with this diagnosis would be dead within two or three years following surgery. For this reason, aneurysmectomy was usually routinely performed. However, more recent reports have challenged this tendency to resect all abdominal aortic aneurysms. These reports have pointed out the fact that not all patients in these nonoperated series who died during this brief follow-up period died of aneurysmal rupture. In fact, a considerable portion of these patients died because of arteriosclerotic complications in other locations, complications such as myocardial infarction or stroke. These reports also point out that these same complications occurred in patients surviving aneurectomy. Finally, there have been a number of reports suggesting that the smaller aneurysms do not rupture quite so readily. The incidence of rupture in the larger aneurysms is about four times as frequent as in the smaller ones.

Probably the best statistics on the subject have been offered by Szlagyi, who presented cumulative survival rates comparing operative and nonoperative cases that had been standardized for age, cardiac status, and blood pressure. Unfortunately, he did not incorporate the operative mortality in his original statistics.

There is quite an advantage of surgical over nonsurgical measures in treating larger aneurysms (those over 6 cm in diameter) because of the high rate of rupture which occurs in the first two or three years. The advantages of surgery in treating the smaller aneurysms, though definite, are much slimmer. Since the slopes of the late survival curves are not too dissimilar in all of these groups, what one must do in selecting surgical candidates is to weigh the immediate risk of operation against the risk of rupture which usually occurs within the first two or three years.

Overall statistics from the major reported series have shown that about one third (or slightly more) of the patients treated for aneurysms will die of rupture, about one third will die of other conditions (mainly myocardial infarction or stroke), and about one third (or slightly less) will survive for five years if not operated on. Balanced against this we must place an immediate operative mortality rate which now probably approaches 5% in major in-

stitutions, plus an additional late mortality rate of approximately 10% from graft failures and related complications.

Against this general background, we must consider the patient's age, operative risk, size of the aneurysm, and symptoms. For example, associated abdominal pain or tenderness carry a very poor prognosis without surgery. Approximately 70% of the patients who rupture their aneurysms do so within a week of the onset of pain, 80% within a month, and 90% within a year.

Age was obviously a consideration in treating this patient, and we gave it much thought before deciding to operate. When does one withhold aneurysmectomy on the basis of age alone? Some surgeons would exclude all cases over the age of 70. Edmonds has presented some comparative statistics on the operative vs the nonoperative management of octogenarians with abdominal aortic aneurysms. These statistics show that in spite of the higher initial mortality in operative cases (which apply mainly to the cases with cardiac symptoms), this is more than offset by the time of the three and five year followup, at which time the overall mortality rates for operative cases are about half those of the nonoperative cases, regardless of cardiac status. However, there is probably some selection built into these statistics, since they were taken from different series.

In the final analysis, one has to individualize for a given patient. In this particular patient, we decided to operate in spite of her age and obesity, because she still led a very active life, had no significant evidence of arteriosclerotic problems elsewhere, and had an aneurysm which we would classify as large. The jet of the aorta flow was directed not straight into the distal aorta and arteries, but into the sac of the aneurysm at an area in the wall where there was no laminated clot, so that the wall was quite thin. Finally, this patient did have abdominal tenderness in the area of the aneurysm on examination. We were never sure that her pain was caused by the aneurysm, but we could not ignore the tenderness.

It must be remembered that if one elects to withhold aneurysmectomy, one must be willing to accept an operative mortality rate of 33% to 67% for emergency operation, which does not include the cases that do not reach the operating room. The operative mortality for elective aneurysmectomy has gradually dropped over the years from about 15% to around 5%, due to refinements in operative technique, anesthesia, and supportive care. Even in the immediate postoperative mortality, as in the late mortality, half of the patients die of complications related to their generalized arteriosclerosis, particularly myocardial infarction. And these other complications, such as cardiovascular accidents, intraoperative hemorrhage, shock, and renal failure can be minimized. For example, avoiding dissection of the aneurysm from the inferior vena cava reduces the interoperative blood loss and the aortic occlusion time.

The next group of complications include the technical failures and recurrent primary aneurysms above the proximal suture line, disruption of the suture line with hemorrhage, and false aneurysm or aortoenteric fistulas. These have been reduced by the inclusion of an additional proximal segment of diseased aorta in the resection, improved prosthetic and suture material, and careful reperitonealization to isolate the duodenum from the upper suture line.

Finally, regarding the final complication, ischemic colitis, if the inferior mesenteric artery (which is frequently, but not always, occluded in aneurysms) is patent or suspiciously large, or if the superior mesenteric or iliac arteries are noted to be occluded or there is a bruit over them, then one should consider preserving the inferior mesenteric artery. The usual procedure is to clamp the inferior mesenteric artery with a vascular clamp and remove it from the aneurysm with a small cuff. Then, after performing the anastomoses, the viability of the bowel is noted and felt for pulsations. A clamp is released to check for good backbleeding. If these signs are present, there is no need to worry about ligating the vessel. Otherwise, it is preferable to anastomose it to the side of the graft.

Finally, I think that pulmonary complications, particularly in older people, are significant. In this particular patient, we did not take any unnecessary chances. We kept her on the respirator overnight and kept suctioning out her tracheobronchial tree. This seemed to play a significant role in her recovery.

Case 4

Dr. Zuidema: The final presentation involves a patient with cirrhosis, portal hypertension, and bleeding esophageal varices. The case will be presented by Dr. Richard Scott.

Dr. Scott: This was the first Hopkins admission of a 46-year-old white male attorney who was transferred to Hopkins from eastern Maryland for evaluation of upper GI bleeding. The past medical history and review of systems are noncontributory. The social history was significant only in that the patient had a 20-year history of heavy alcohol intake.

The patient traced the onset of his present illness to 1964 when he was hospitalized in eastern Maryland with infectious hepatitis. Some time later, the patient experienced an episode of generalized malaise, hematemesis and melena on three consecutive days. On the third day, the patient was again hospitalized in eastern Maryland.

Physical examination upon this hospitalization showed a generally well-developed, well-nourished man with a severely protuberant abdomen, with

four-plus ascites and massive hepatomegaly with four-plus guaiac stools. At this time, the patient had a hematocrit of 34% which subsequently dropped to 21%. The patient received four units of whole blood which raised his hematocrit to 34%; it remained stable at this level. An upper GI series revealed the presence of numerous large esophageal varices. A decision was made to transfer the patient to Hopkins for further evaluation.

Physical examination upon admission to Hopkins showed the patient to be in no apparent acute distress. He was afebrile with normal vital signs. The heart and lungs were unremarkable. Examination of the abdomen revealed it to be slightly protuberant, soft, with normal active bowel sounds, and a liver edge palpable approximately seven finger breadths below the right costal margin. The remainder of the examination was well within normal limits.

The pertinent laboratory data revealed a hematocrit of 34% and a prothrombin time of less than 25%. A diagnosis of Laennec's cirrhosis, with portal hypertension and esophageal varices, was confirmed. The patient underwent esophagoscopy, at which time numerous large esophageal varices were demonstrated without any active site of bleeding. On January 10, 1969, the patient underwent exploratory surgery by way of a large right subcostal incision to permit an end-to-side porta-caval anastomosis. The pre-anastomosis portal vein pressure was recorded as 43 cm of water, and the postoperative portal vein pressure was recorded after the end-to-side anastomosis as 29 cm of water. The patient tolerated this procedure very well, and was returned to the recovery room in satisfactory condition. His postoperative course was uneventful, and he was discharged in satisfactory condition on his 14th postoperative day.

Dr. Goldenberg (discussing the radiological findings): The preoperative chest of the patient showed bilaterally elevated diaphragms. The one on the right was the most markedly elevated, probably a result of the enlarged liver. An upper GI series showed serpentine radiolucencies in the lower esophagus, which are probably large esophageal varices.

Dr. Bieseker (discussing the pathological findings): An open biopsy of the liver taken during the operation showed cleared areas of fatty infiltration interspersed among areas of liver tissue. There was an abnormal amount of fibrous tissue. Around these lobules of liver of different sizes there was a sprinkling of inflammatory cells found in the portal areas.

A Masson's stain showing the extensive amount of fibrosis also revealed lobules of liver of different sizes, some large, some quite small. These sometimes appeared to be bisected with fibrous tissue distributed actually within the lobules themselves. This amount of fibrosis in the presence of the fat that is distributed throughout the lobules, both large and small, is very suggestive of a diagnosis of Laennec's cirrhosis. (We use the term cirrhosis when there is evidence of liver injury with regeneration and fibrosis present.) There were many mononuclear cells (lymphocytes) spread throughout the portal areas. There was also a suggestion of bile duct proliferation. The liver cells suggest injury, in that the cytoplasm had become vacuolated. In certain areas, there was a pinkish discoloration of the cytoplasm suggesting cell damage. Occasionally, there was a cell that may be polymorphonuclear. Some of these liver cells appeared to be degenerating in areas.

The pinkish discoloration of the cytoplasm can be interpreted as alcoholic hyaline. With this liver cell injury, there was also a sprinkling of inflammatory cells throughout some of the parenchyma.

In summary, the liver had a well-established cirrhosis with scarring and alcoholic hyaline. There was a minimal-to-slight chronic active hepatitis present.

Dr. Zuidema: This case illustrates a number of features of patients with portal hypertension and some typical considerations in terms of their management.

This particular patient illustrates the method of choice in managing patients with this problem. The patient gave a typical history, was admitted to the hospital, and responded very promptly to supportive therapy. This gave us and his physicians in eastern Maryland an opportunity to properly prepare him for portal decompression.

On admission the patient was noted to have marked ascites. This was treated medically during the course of his hospitalization, both in eastern Maryland and at The Johns Hopkins Hospital, and he responded very well. At the time of the operation he had very little ascitic fluid, perhaps 50 to 60 cc, and had therefore very favorably responded to treatment. This is the case in virtually 98% or 99% of the patients with portal hypertension and ascites. Although a considerable amount of attention has been given to the use of portal decompression for the treatment of ascites, in most cases this is unnecessary. By careful salt and fluid restriction, and by the judicious use of diuretics, the ascites will be controlled. We usually begin with hydrodiuril and change to ethacrynic acid if necessary. Aldosterone antagonists can also be used to advantage if the ascites is slow to clear. This is perfectly satisfactory. We know that a side-to-side type of shunt can very satisfactorily deal with patients with refractory ascites. But there are relatively few instances in which it has to be employed.

One might question the necessity of performing esophagoscopy, when the X-ray diagnosed esophageal varices. However, the patient was being prepared for an elective porta caval anastomosis, and we wanted to be completely accurate in our preoperative evaluation. Dr. Eddy Palmer and others have

shown the frequency with which other sources of GI bleeding may be found in patients with cirrhosis. Dr. Palmer has estimated that as high as 20% to 25% of patients presenting with upper GI hemorrhage and cirrhosis of the liver may have other GI sources at fault. Most commonly, these include patients with peptic ulcer disease who ordinarily have a higher incidence of peptic ulceration.

The other significant contributing agent is the group of patients with alcoholic gastritis who are admitted with acute hemorrhages. We want to be as precise as possible in our diagnosis, for in some instances, a porta caval anastomosis is not necessary for control of their portal hypertension. In fact, it is a very poor operation for gastritis. There will also be some patients with the Mallory-Weiss syndrome, the mucosal lacerations at the esophagealgastric junction. And these too should be diagnosed preoperatively, if at all possible.

At any rate, we were convinced, on the basis of the radiological and esophagoscopic findings, that the patient had been bleeding from his esophagogastric varices. There was no sign of gastritis or peptic ulceration, and consequently, the portal decompression was performed.

There is some current debate concerning the best method of managing patients with portal hypertension. With each episode of hemorrhage in a patient with cirrhosis, approximately 17% of the patients will die with the first hemorrhage. About the same number will die with the second hemorrhage, and this will then rise with the third episode until, by the fourth and fifth episodes, approximately 50% of the patients will die from upper gastrointestinal hemorrhage alone. This is in marked contrast to the patients developing portal hypertension on the basis of portal vein thrombosis. The latter group have portal hypertension, but have well-preserved hepatic function. And, the mortality associated with each individual episode of hemorrhage is substantially lower. Consequently, there is a significant difference in the life expectancy in these two groups and in the method of management.

After the first episode of bleeding, 70% of the patients with cirrhosis will be dead at the end of about one year. In reviewing studies by the Boston Interhospital Liver Group, and Ratinoff and Patek in 1942, few changes have been made in the past 25 years in the treatment of patients with cirrhosis.

Studies by Merendino and Volwiler again show that the life expectancy falls after the first hemorrhage, and in contrast, falls after the discovery of varices, but before hemorrhage has occurred. (Actually, only about 30% of patients with esophageal varices bleed from them, and therefore become candidates for operation.) The mortality shown in patients who do not bleed can be attributed directly to the deterioration of their liver function. The mortality in patients who do bleed is due to the deteriorating liver function and the additional stresses of hemorrhage, repeated transfusions, aspiration pneumonia, etc. To determine the state of the liver function or operability, the patients can be clinically divided into categories according to their liver function as to A, B, or C on the basis of serum bilirubin, the ability of the liver to synthesize albumin, the presence or absence of ascites (and if so, whether it is easily controlled), whether or not the patient has ever had an episode of portal-systemic encephalopathy, and finally, whether or not he is able to maintain a reasonable state of protein nutrition. This shows up most graphically in the loss of lean muscle mass, the wasting away of the skeletal muscle. Our patient fell into the B category. In addition, his prothrombin was low and remained low despite the administration of an aqueous colloidal solution of vitamin K1 (AquaMEPHYTON).

Whenever one encounters a patient with portal hypertension and considers him a candidate for portal decompression, one must be concerned with the risk of portal systemic encepholopathy following portal caval anastomosis, which is the major complication in the postoperative period.

A clinical study by Wantz and Payne again divided the patients into groups A, B, and C. There was only an 8% incidence of portal systemic encephalopathy in the good risk group postoperatively. Two thirds of these cases were transient and temporary in nature.

In the B group, the incidence rose somewhat, but it is not until you get to the poor risk group, the C patient with cirrhosis, that you begin to develop a very high incidence of crippling encephalopathy.

Our own experience with hepatic encephalopathy developed after end-to-side porta caval anastomosis shows that in the good risk group, there was no appreciable incidence of encephalopathy. The moderate risk group had an incidence of 20%, but it was the transient, nonrecurrent variety. So it was our feeling that this patient faced only a very modest risk of developing this complication, and indeed he failed to develop it in the postoperative period and in his follow-up period to date.

Obviously, portal decompression has something to offer to patients in terms of controlling recurrent variceal hemorrhage. There have been enough studies now to realize that the determinant factor affecting the patient's longevity is the basic hepatic function which he enjoys. It is essential that these patients totally and completely give up alcohol. If not, they commit very slow suicide. It is not at all unusual for a patient who continues to use alcohol to develop late hepatic failure.

On the other hand, there are a great many patients, particularly with portal cirrhosis, who on the basis of long-term follow-up, have done extremely well up to ten and eleven years without developing any later manifestations or complications.

Presented at the 1969 Annual Meeting of the Medical and Chirurgical Faculty of the State of Maryland, April 9.

Intrasynovial Corticosteroid Therapy in Arthritis

JOSEPH LEE HOLLANDER, MD
Professor of Medicine
Hospital of the University of Pennsylvania
Philadelphia

I am not a geriatrist, in that I do not limit my practice of medicine to those in their declining years. Actually, however, as a rheumatologist or "arthritis specialist", I have found myself intimately concerned with many painful afflictions that seem to be an inescapable part of what can euphemistically be called our "period of receding youth". The majority of my patients are over 50 years of age.

In trying to fulfill the physician's time-honored ambition "to cure a few, to help many, and to comfort all" his patients, we are too often frustrated. It has been a great personal satisfaction to have devised a method for local palliative treatment which has become more and more successfully used by physicians over the past 18 years, and now is accepted as a standard form of local therapy for arthritis and related conditions. Intrasynovial corticosteroid therapy, which we introduced in 1951, appears to have withstood the test of time.[1] We have injected suspensions of steroid into inflamed joints, bursae, or tendon sheaths of more than 8,000 patients a total of nearly 250,000 times during this period of years. Such injections have been repeated, as needed, for continuing suppression of *non-septic* local inflammation over periods of many years without the hazards incident to systemic corticosteroid therapy. Whenever the local inflammation is a part of a systemic disease, such as gout, rheumatoid arthritis, or systemic lupus erythematosus, local steroid treatment is only an adjunct to general therapy of patient and disease.

The danger of adverse reactions from intrasynovial steroid injections is small, *providing* careful technique is employed. Fastidious aseptic precautions for injections and proper placement of the anti-inflammatory medication within the inflamed joint, tendon sheath, or bursa are both extremely necessary to avoid introducing infection and to assure the effectiveness of each injection.

Aspiration of joint fluid is extremely helpful in differential diagnosis of arthritis, and a diagnosis should be made before steroid is injected, at least to exclude infection as the cause. Aspiration and injection of joints in arthritis, therefore, can be of both diagnostic and treatment value at the same time. In our clinic we jokingly refer to this as "instant diagnosis and treatment".

Synovial Fluid Analysis (Synovianalysis)

In earlier reports,[2, 3] we have reviewed simple methods for performing a routine analysis of synovial fluid. We have emphasized that the appearance of the fluid is often helpful since the fluid from osteoarthritis is clear and yellow, that from rheumatoid arthritis is cloudy with a greenish tint, that from traumatic arthritis is usually blood-tinged, and that from gout may look similar to that of rheumatoid arthritis or may be almost milky white. The viscosity of the fluid may readily be estimated simply by dropping the fluid from a syringe or dropper, or by stringing it from a drop between two fingers. Dropping fluid into acetic in a beaker will form a clot. If this clot is firm and does not break up on shaking, the mucin clot is normal, as in osteoarthritis. If the clot is friable and breaks into shreds or even makes the surrounding fluid cloudy on shaking, the poor quality is more typical of an inflammatory arthritis such as rheumatoid arthritis, gout, or septic arthritis.

Cell counts of the synovial fluid are performed as for a white blood cell count, but using 0.3% saline as diluent is preferred for accuracy. Very cloudy fluids are also sent for cultures for microorganisms. Differential cell counts on the fluid may be done by centrifuging the fluid and smearing the sediment out on slides for staining with Wright's stain.

The above is a quick review of some of the simple tests. Most important of all is to place a drop of fresh synovial fluid on a microscope slide, cover with a cover slip, and examine it under the microscope.

In the fluid from an osteoarthritic joint the number of cells is small, and most are lymphocytes or synovial lining cells. Also present, however, are fragments or chards of cartilage broken off from the surfaces. The fragments are suspended in the fluid for long periods, but are finally digested by phagocytes.

In 1960 we first demonstrated[4] that in fluid from gouty joints, crystals of sodium biurate are seen as small rod-like or needle-like fragments, appearing dark under ordinary light, bright under polarized light, and in yellow or blue against the red background if a red plate compensator is used in a polarizing microscope. In the fluid from an acute gouty joint these crystals are nearly all intracellular, undergoing phagocytosis by the neutrophiles. This finding has helped to establish that the acute gouty attack is brought about by the rapid deposition of urate crystals in a joint, causing sudden chemotaxis of neutrophiles to phagocytize these foreign bodies. Gouty attacks can be produced in normal volunteers and in gouty patients simply by injecting enough urate crystals into a joint. Thus you can see that these findings on synovianalysis opened a long neglected field of research in gout, and led to some important new data on the pathogenesis of gout.

In looking at fluids from patients with severe osteoarthritis, and others with non-gouty acute attacks of joint swelling, McCarty[5] found crystals that were not urate, but somewhat resembled it. He was able to demonstrate by chemical and X-ray diffraction that such crystals were calcium pyrophosphate, and such crystals were characteristic of what he called pseudogout, described by others from X-ray appearance as chondrocalcinosis. Such crystals may be seen throughout the bits of cartilage found in joint fluid from such patients, may float free, or may be intracellular. It has been shown *by synovianalysis,* therefore, that a new entity, chondrocalcinosis, consists of a deposition of calcium pyrophosphate crystals in joint cartilage *and joint fluid.*

In 1963 Dr. McCarty's laboratory and ours observed a new finding in the fluid of rheumatoid arthritis. It has always been puzzling to us why the fluid of rheumatoid arthritis contains so many neutrophilic leukocytes, whereas the synovium itself is loaded with lymphocytes and plasma cells. In many of the leukocytes seen in rheumatoid arthritic synovial fluid there appear relatively large and dark granules in the cytoplasm of the unstained cells. These granule-bearing leukocytes have not been morphologically specific for rheumatoid arthritis, but have opened the way for a whole new line of research on the pathogenetic mechanism of rheumatoid joint inflammation.[6] Again, this illustrates what careful study of synovial fluid can bring to light.

In the synovial fluid from inflamed joints of patients with systemic lupus erythematosus, as well as in pleural or pericardial fluid, the sediment can be smeared on a slide, stained with Wright's stain, and many typical L.E. cells will be seen. In the fluid from joints of a patient with Reiter's syndrome, as well as in some other acute inflammatory forms of arthritis, peculiar giant cells containing phagocytized leukocytes may be seen.

In joint fluid or bursal fluid from long-standing rheumatoid arthritis we often see cholesterol crystals. This is "cholesterol gout", but most of the facts about this are still unknown. Joint fluid may also contain crystals of corticosteroid if such has been recently injected. In short, much can be learned from examining synovial fluid, and there is still more to be learned.

General Technique for Joint Aspiration and Injection

Before any joint is aspirated, the physician is wise to refresh himself on the local anatomy from an ana-

tomical atlas and X-ray photographs of the inflamed joint. The object of joint paracentesis is to puncture the involved synovial space as painlessly as possible, aspirate any synovial fluid, and then inject the steroid with minimal trauma and without introducing infection. The optimal site for paracentesis of a joint is usually on the extensor surface at a point where the synovium is closest to the skin, and at a point comfortably remote from any major artery, vein, or nerve. Details for injection of specific joints, tendon sheaths, and bursae have been described in Chapter 24 of our textbook *Arthritis.*[7]

When the site for paracentesis of the joint, tendon sheath, or bursa has been determined, the overlying skin is scrubbed with antiseptic detergent, then painted with antiseptic solution and allowed to dry. If marked effusion is present, it is seldom necessary to procainize the tissues, as the needle can be inserted quickly and almost painlessly. A brief spraying of the injection site with ethyl chloride makes needle insertion through the skin painless. If procaine infiltration is felt necessary, a small skin wheal is made with infiltration down to the synovium injecting about 2 cc-4 cc of procaine.

The aspirating needle, #19 or #20 gauge, is inserted through skin, subcutaneous tissue, capsule, and synovium quickly but gently, with a "sliding" rather than a strong thrusting motion. Disposable needles, used but once, are consistently sharp and meet little resistance. The aspirating syringe plunger is gently withdrawn to pull out any fluid in the sac for synovial fluid analysis. Sometimes fibrin within the space, or folds of synovial tissue, will plug the needle by acting as a flap-valve. Gentle reinjection of a little of the fluid may displace this, permitting withdrawal of all the fluid. From a larger synovial space, such as the knee, not fully distended by fluid, more can be withdrawn by "milking" the synovium with the hand toward the site of aspiration. After all available fluid has been withdrawn, the aspirating syringe is detached, leaving the needle in place. (If fluid is turbid or purulent, culture is taken and no steroid injected until diagnosis is established.)

The desired amount of corticosteroid suspension is drawn into the smaller syringe (usually about ½ cc-1½ cc depending on joint or bursal size), and then the syringe is attached to the aspirating needle, still in place, and the suspension gently injected. If more than gentle pressure is required on the plunger of the syringe, the needle should be readjusted as it is probably not in the synovial space. After injection of the steroid, the syringe and aspirating needle are withdrawn, the skin cleansed with alcohol sponges, dried with gauze pads, and a small patch dressing is applied. The patient may then resume necessary activity, but should be warned not to abuse the recently injected joint.

Joint injections may be repeated indefinitely, but only as needed for recurrence of joint pain and swelling. Reinjection is not advisable more often than once monthly into a given joint, and longer intervals are desirable whenever possible. We have reinjected an arthritic joint more than a hundred times over the past 17 years, but recommend both minimal steroid dosage and infrequent reinjection in most cases, as this decreases the chance for development of instability in the affected joint.

Choice of Steroid for Intra-articular Injection

Hydrocortisone acetate suspension was the first preparation used for intrasynovial injection. Although this induced palliation of the inflammation in most joints, the duration of effect was sometimes less than a week. After a search for longer-lasting local corticosteroid, we found that a branched-chain ester enhanced the duration of the repository steroid in the joint, apparently being more slowly dissociated by the enzymes. On the average, injection of hydrocortisone t-butyl acetate was followed by twice as long a period of relief from pain and swelling as the hydrocortisone acetate in equal dose had produced previously (Table 1).

Table 1: Comparative Duration of Palliation in 20 Rheumatoid Arthritic Knee Joints

Hydrocortisone Acetate (37.5 mg)	**6.0 days**	**(average)**
Hydrocortisone t-Butyl Acetate (37.5 mg)	**12.1 days**	**"**
Prednisolone Acetate (30 mg)	**7.8 days**	**"**
Prednisolone t-Butyl Acetate (30 mg)	**14.5 days**	**"**
6-Methyl Prednisolone Acetate (30 mg)	**8.2 days**	**"**
Dexamethasone Acetate (5 mg)	**7.6 days**	**"**
Dexamethasone t-Butyl Acetate (5 mg)	**14.9 days**	**"**
Triamcinolone Diacetate (30 mg)	**7.7 days**	**"**
Triamcinolone Acetonide (30 mg)	**14.2 days**	**"**
Triamcinolone Hexacetonide (20 mg)	**21.2 days**	**"**
Betamethasone Acetate (5 mg)	**8.7 days**	**"**

Other steroids, and a variety of esters of these steroids were studied by repeated injection into joints. The average duration of effectiveness from each is listed in the table. It will be seen that prednisolone t-butyl acetate has palliated as long after injection as any of the newer steroids except one. That one has just been cleared for general intra-articular use by the FDA after we had studied it for nearly ten years. Triamcinolone hexacetonide, now marketed as *Aristospan,* will usually give longer and more complete relief after injection into a joint than any other available preparation. It is the one we use whenever prednisolone t-ba does not suppress local inflammation for a long enough period to be of practical value. Because of its potency, however, *Aristospan* is also the easiest to abuse, so we limit the dose to 20 mg into any large joint, and repeat injections no oftener than every six weeks.

There are some patients in whose joints it seems to make no difference which of the steroid suspensions are used, as all are equally effective for about the same length of time. The value of having available alternative steroid suspensions is for treating those who achieve transient relief from one preparation, even on repeated trials. Such patients often experience relief in the injected joint for weeks or months from another steroid.

Long-term Results from Repeated Intra-articular Steroid Therapy

Injection of corticosteroid into an arthritic joint never cures the condition. Only when there is *temporary* involvement of a certain joint does such treatment seem to have a "permanent" palliative effect. Since bursitis is usually a transitory inflammation, steroid injection may be said to "cure" it, as complete relief is usually prompt and may last indefinitely.

Follow-up on more than 8,000 patients has been impossible, but we have chosen to follow the first 100 patients who received steroid into rheumatoid arthritic knees over the past 17 years, and the first 100 patients with osteoarthritic knees treated similarly. The results are tabulated in Table 2. Of those requiring relief from rheumatoid arthritic knees, nearly 40% no longer need repeat injections as their knees have ceased to be actively inflamed during the follow-up years. Thirty-three knees were still active enough to require occasional reinjection. Of these 70 knees, however, the most significant finding was the *absence* of flexion contractures, and the continued good function of the knees even after 17 years, whether or not the X-rays showed increased erosions and narrowing of the joint spaces. The same was true for nearly 80% of the osteoarthritic knees. Of the others, a sizable percent required arthroplasty (11% of rheumatoids and 5% of osteoarthritics), and in some the injections were abandoned because relief was too transient to justify continuation. The injections did not cure the arthritis in any; probably did not retard the disease in many; may have accelerated the destruction in some; but *did* seem to prevent deformities in most of the rheumatoids and helped most of both groups to continue walking in greater comfort for as long as 17 years.

Similar results have been noted following repeated injection of other joints with corticosteroid for rheumatoid and osteoarthritis, with an even smaller incidence of increasing difficulty in non-weight-bearing joints, and in bursae or tendon sheaths. This cannot be said, however, for hip joints, even in osteoarthritis. The last portion of Table 2 shows that well over half have required and had arthroplasties, either cup or Austin-Moore prostheses, because of continued or even accelerated deterioration of the joint. Less than 10% no longer require injections because the arthritic pain ceased to be a problem, and in 21% occasional injections are needed. If one or a few injections into a hip do not give lasting relief from pain when physical activity has also been limited to necessary weight-bearing only, operation is usually indicated.

Table 2: First 100 Rheumatoid Arthritic Knees, after 17 Years

Injections Discontinued, no longer needed	**37**
Still Receiving Periodic Injections	**33**
Injections Stopped—Synovectomy, Arthroplasty	**11**
Injections Stopped—Ineffective	**6**
Patient Died from Systemic Disease	**4**
Infection of Knee, requiring Arthrodesis	**1**
Could not be Traced for Follow-up	**8**
X-rays showed progression of disease in 61, of 82 checked	

First 100 Osteoarthritic Knees, after 17 Years

Injections Discontinued, no longer needed	**57**
Injections Discontinued, arthroplasty done	**5**
Still Receiving Occasional Reinjections	**22**
Injections Discontinued—inadequate relief	**11**
Could not be Traced for Follow-up	**5**
X-rays showed progression in 37, of 67 checked	

First 100 Osteoarthritic Hips, after 17 Years

Injections Discontinued, Arthroplasty done	**57**
Injections Occasionally Repeated as needed	**21**
Injections Discontinued, no longer needed	**9**
Patient Died from Unrelated Disease	**6**
Could not be Traced for Follow-up	**7**
X-rays showed progression in all 93 checked	

Adverse Effects from Intra-articular Steroids

The most common undesirable effect from corticosteroid injection into an arthritic joint has been a temporary exacerbation of the inflammation, paradoxically from the steroid itself. McCarty and Hogan[8] have demonstrated this "post-injection flare" is a crystal-induced synovitis. It occurs after less than 2% of injections, and usually lasts only a few hours, after which the anti-inflammatory effect of the steroid predominates over the irritating effect of the injected microcrystals.

Infection has occurred in a joint following steroid injection a total of 18 times in our series (Table 3). This incidence is less than one per 10,000 injections, or 0.076%. During the past eight years, the incidence of infection following injection has been less than 1 per 15,000 since we have used disposable syringes and needles exclusively, in addition to our customary careful skin cleansing and use of antiseptic solution. The occurrence of joint infection is a serious complication, and must be carefully and continually guarded against.

Whenever the joint that has been injected becomes inflamed for more than a few hours, aspiration for re-examination and culture are strongly recommended. Prompt diagnosis and treatment of such infections results in little morbidity. This result was achieved in 11 of our 18 iatrogenic infections in whom diagnosis

was suspected and adequate treatment instituted within 48 hours. In the other seven patients, diagnosis or institution of adequate antibiotic therapy was delayed for at least several days, resulting in a prolonged course of weeks or months, surgical drainage, and eventual loss of considerable joint function in four cases, and the need for arthrodesis in the other three. Such cases are rare, but disastrous. All these latter seven infections were staphylococcic, but were sensitive to some of the available antibiotics.

Table 3: Summary of Adverse Effects after 18 Years (Approximately 235,000 injections in about 8,000 patients)

Post-injection Flareup of Symptoms (Crystal Induced)	**2% of Injections**
Infection of Joint after Injection (18 instances)	**0.076% of Injections**
A. Prompt Diagnosis and Adequate Therapy—Good Result	**11 patients**
B. Delayed Diagnosis, and/or Inadequate Therapy—Surgical Drainage, Long Course, or Arthrodesis	**7 patients**
Instability of Injected Joint—Osteonecrosis of Knee or Hip (79 joints of 62 patients)	**less than 1% of patients**

The most serious complication of repeated corticosteroid injections into arthritic joints has been the development of instability of that joint, apparently from development of osteonecrosis of the juxta-articular bone. Although this occurred in less than 1% of our more than 8,000 patients, many more could have developed if we had not become alerted to this danger fairly early in our experience.

Whether osteonecrosis is caused by the steroid injection itself, or by abuse of the joint permitted by removal of the warning sign of pain, is not definitely known. We have noted this has only occurred in weight-bearing joints (hip and knee), particularly if larger doses of steroids have been used, or if injections have been repeated more often than once monthly for a long time. This problem has been the reason we warn that minimal doses of steroid should be used, and repeated injections made at infrequent intervals.

In all of the 37 hip joints which developed aseptic necrosis while under intra-articular steroid therapy, an Austin-Moore prosthesis was required for maintenance of function, and knee prosthetic arthroplasties were required in 42 instances because of increasing lateral instability of the treated knee. Again, the rarity of this complication in this large series must not minimize the danger, and its occurrence makes us aware that we are not curing the arthritis, only palliating the symptoms. The disease goes on its destructive way, and may actually be accelerated by "sweeping the symptoms under the rug", allowing a patient to abuse his arthritic joint unless he is warned of the potential danger.

Summary and Conclusions

Over the past 17 years we have aspirated and injected arthritic joints of more than 8,000 patients a total of nearly 250,000 times. We encourage aspiration of all accessible arthritic joints for the diagnostic value of synovial fluid examination. Injection of minimal doses of corticosteroid suspension into inflamed arthritic joints, bursae, or tendon sheaths produces relief of pain and swelling for fairly prolonged periods of time, and reinjection after return of symptoms can reduplicate the effect repeatedly over many years of treatment.

Intra-articular steroid therapy has definite limitations, is useful when one or only a few joints are the major cause of disability, and must be only an adjunct to general or systemic therapy in most conditions. Adverse effects, such as infection following joint injection, or joint destruction following repeated injections, are rare but serious. Each must be watched for and treated promptly and adequately.

Intra-articular corticosteroid therapy has advantages over systemic steroid therapy in the infrequency of adverse effects and can be more readily discontinued without relapse than systemic corticosteroids. It is a local treatment, and a potent one.

Despite its limitations and potential dangers, we conclude that *no other form of treatment for arthritis has given such consistent local relief from pain to so many for so long with so few harmful effects.* We continue to use intrasynovial steroid therapy for the palliation of local inflammation from arthritis or related conditions in a steadily increasing number of satisfied patients.

Dedication To Our Doctors

DOCTORS' DAY

MARCH 30, 1970

Doctors' Day is a special day observed each year to honor the members of the medical profession, both living and dead, who have devoted their lives to the art of healing.

The idea of Doctors' Day originated in Georgia in 1933 and was adopted by the Woman's Auxiliary to the American Medical Association in 1934. Since the analogy of the carnation is closely intertwined with medical science, the red carnation was chosen in 1949 as the symbol of Doctors' Day.

March 30th, the official date, commemorates one of the greatest discoveries for the alleviation of pain and suffering. On March 30th, 1842, Dr. Crawford W. Long first used ether anesthesia in surgery.

In recognition of the doctors' contributions to the people and to the communities they serve, the Heart Association of Maryland will dedicate its window to a display honoring Doctors' Day from March 23rd until April 6th.

Also in honor of Doctors' Day, a contribution will be made by our auxiliary to the American Medical Association Education and Research Foundation, to be divided equally between The Johns Hopkins University and the University of Maryland School of Medicine.

Mrs. Robert A. Reiter, President
Woman's Auxiliary to the
Baltimore City Medical Society

Mrs. Max R. English, Chairman
Doctors' Day

your medical faculty at work

by John Sargeant
Executive Secretary

The Executive Committee met on January 8, 1970 and took the following action:

1. Adopted the 1970 budget for recommendation to Council with certain stipulations regarding expenses of various departments of the Faculty;
2. Agreed to continue providing financial aid o a physician's wife and family, if the physician-member is totally incapacitated;
3. Deferred action again in connection with proposed Health Department Radiation Control regulations until more information is available;
4. Approved the mailing of a questionnaire to members regarding their use of Faculty facilities and services;
5. Approved the proposed Food and Drug Law as requested by the State Department of Health and Mental Hygiene;
6. Deferred action on a proposed feasibility study in connection with Medical Economics; and also deferred action on the AMA Study on Long-Range Planning on which comments have been requested;
7. Requested legal counsel to attend the next Executive Committee meeting at which time discussion would take place on filing an Amicus Curiae brief on a legal case dealing with conviction of an individual on the basis of information provided his attending physician;
8. Requested further discussion with representatives of the Governor's Commission on Law Enforcement in connection with a proposed questionnaire that would be mailed to physicians;
9. Agreed to a tentative agenda for a joint meeting with the Executive Committee of Hospital Council, Inc., and the Faculty's Executive Committee;
10. Approved for recommendation to the Council, nominees for (a) Blue Shield Board of Trustees (b) Blue Shield Medical Relations Committee (c) Blue Shield Reference and Appeals Committee and (d) Blue Cross Board;
11. Adopted for recommendation to Council a resolution on the Transportation of Emotionally Disturbed Patients;
12. Heard that the State Department of Health and Mental Hygiene is in the process of developing a "formulary" for use in treatment of Medicaid patients. The use of the formulary will be on a volunteer basis.

The Council of the Faculty met on January 22, 1970, and took the following action:

1. Approved appointment of an additional member to the Medical Advisory Board, Department of Motor Vehicles;
2. Approved requests of components dealing with recommendations of members for Emeritus Membership to the House of Delegates;
3. Waived 1970 dues for two members because of illness, at the request of the component society;
4. Approved changing the Annual Meeting dates for 1971 to April 28, 29 and 30; and for 1972 to May 3, 4 and 5;

5. Adopted the following recommendation of the Prince George's County Medical Society:
   "That the Faculty be requested to work for legislative changes through the General Assembly of the State of Maryland by virtue of which the defendant in torts would be permitted to have the final option as to whether he would be tried before a Judge or Jury";
6. Presented the "thought" behind the following resolution to an ad hoc committee for study and report to the 1970 Annual Meeting:
   "That the Faculty be requested to work for legislative changes through the General Assembly of the State of Maryland seeking to have the contingent fee method of payment between attorney and client made illegal"
   after it rejected adoption of this resolution;
7. Reaffirmed current policy that exhibitor space shall not be leased for the purpose of promotion of clinical laboratory services, whether owned or operated by lay persons or physicians;
8. Rejected a proposed resolution dealing with the Transportation of Emotionally Disturbed Patients, on the basis that this was a local problem and should be solved locally;
9. Submitted various names to the Blue Shield Board of Trustees for consideration by its Nominating Committee to (a) Blue Shield Board (b) Medical Relations Committee and (c) Reference and Appeals Committee;
10. Submitted three names to the Blue Cross Board of Directors for consideration by its Nominating Committee for election to the Board;
11. Approved the 1970 budget with the understanding that the Executive Committee will make a further report to the Council in March, 1970, with respect to various operations within the Faculty;
12. Heard Eugene Guthrie, MD, executive director of the State's Comprehensive Health Planning Agency, report the current activities of this group;
13. Heard the current status of the suit of Charles County physicians in connection with the hospital bond issue that has been petitioned to referendum in that county.

The Executive Committee met on January 22, 1970, and took the following action:

1. Discussed at some length library operations and deferred action on a request for additional personnel for the library until the February, 1970 Executive Committee meeting;
2. Referred to the Baltimore County Medical Association a request for addressing announcements in connection with a new medical group, inasmuch as this was a local issue.

Place Your Trust In Professional Hands...That Care

Around the clock care is given by our experienced team of registered nurses . . . physical and occupational therapists, licensed dieticians and administrators . . . At House In The Pines we provide Complete Care Programs and facilities for the aged, convalescent and the chronically ill. Physician's orders followed Implicitly.

Laboratory Tests for Rubella and Their Interpretation

J. MEHSEN JOSEPH, PhD
HOWARD GARBER, MD
Division of Virology
Division of Communicable Diseases
Maryland State Department of Health

Rubella is a disease of major importance because of the high incidence of congenital defects found in infants whose mothers are infected, either clinically or inapparently, during early pregnancy. Because of this teratogenic potential of the rubella virus, and the unreliability of clinical diagnosis, rapid and reliable laboratory confirmation of recent infection is often required.[1]

Clinical diagnosis of a rubella-like illness can be confirmed only by virus isolation or demonstration of a fourfold or greater rise in rubella antibody titer in the patient's serum. Because of the considerable expense and time required to isolate and identify the rubella virus, this method has limited application. Also, failure to isolate the virus from clinical material does not rule out the recent or current rubella infection.[2, 3]

Serodiagnosis is the most reliable and practical means of confirming clinical rubella or detecting inapparent rubella in a pregnant woman exposed to rubella-like illness. Four methods are currently available for measuring rubella antibody: 1) hemagglutination-inhibition (HI), 2) complement fixation test (CF), 3) neutralization test (NT), and 4) fluorescent antibody test (FA).

In order to properly apply the serologic techniques and accurately interpret the data, one must understand the dynamics of virus excretion and antibody response. In clinical rubella, virus may be excreted from the throat as early as seven days prior to onset of rash and for seven to fourteen days after the rash appears. This means that a pregnant woman who claims exposure to rubella the day a rash appears on her child could actually have been exposed seven days earlier. Also, this fact must be considered to properly interpret serologic data as to the immune status prior to exposure.

In clinical rubella, HI antibody is detected in the blood 24 to 48 hours after the appearance of the rash. The titer rises rapidly and reaches a peak within six to twelve days after the rash appears. The antibody titer remains undiminished for several years or may show a two- to fourfold decrease. Practically 100% of the cases of rubella develop HI antibody and this antibody persists in the blood probably for life. Because of the rapidity with which HI antibody develops, blood specimens must be collected as near the day of onset or appearance of rash as possible in order to demonstrate a rise in titer. Where a second examination is indicated, the blood specimen should be taken seven to fourteen days after the first specimen is drawn.[4, 5]

The CF antibody is detectable in the blood approximately seven to ten days after the appearance of the rash. The titer peaks at 14 to 21 days (occasionally one month) after onset of rash. After peaking, the

titer falls rather rapidly and CF antibody may persist for only two to three years in most cases. Thus, the CF test is not useful in determining immune status. CF antibody fails to develop entirely in some patients; therefore, a negative CF test is of no diagnostic value. Only a positive titer with a significant rise between acute and convalescent sera is conclusive. The CF test is chiefly a back-up procedure to the HI test since the rise in CF antibody is slower and the peak titer is reached later. It is of value in showing the fourfold rise in titer which may not be evident with the HI test.[6]

Neutralizing antibody makes its appearance at approximately the same time as the HI antibody and shows a similar but lower titer rise. This test is no better than the HI test for serodiagnosis and requires about two weeks to complete.

FA antibody makes its appearance late in the first week of the illness and reaches peak titer by the 14th day. The FA test is a highly sensitive procedure but is most difficult to perform and therefore not routinely employed.[7, 8]

Tests for rubella are useful in the following circumstances:

1. To determine the immune status of pregnant women exposed to rubella, or to establish whether infection has resulted from the exposure
2. To diagnose suspected congenital rubella in the newborn child
3. To determine the immune status of prenatal patients, nurses and other female medical personnel of childbearing age prior to an exposure
4. To confirm, or rule out, rubella in a patient with a rubella-like illness
5. To determine immune status prior to administration of rubella vaccine.

Interpretation of Serologic Data

For the laboratory to select the most useful serodiagnostic procedures for detecting clinical or inapparent rubella infection and to accurately interpret the results, the physician must give the laboratory certain basic information with his initial request. This information should include, in addition to patient identification:

1. Estimated week of pregnancy
2. Date of onset of rubella-like illness, if any
3. Date of exposure to rubella, type of exposure —household or casual
4. Date blood specimen collected
5. If gamma globulin administered, amount and date.

A summary of the interpretation of serologic data in the different clinical circumstances is given below:

A. To determine the immune status of a pregnant woman exposed to rubella or to establish whether infection has resulted from the exposure—When the pregnant woman is exposed to rubella in her own household, several possibilities regarding the date of this exposure exist: (a) she was exposed seven days prior to onset of rash in her child; (b) she was exposed to the same source as her child and may have an inapparent infection; or (c) she herself was the primary case in the household.[9] Two blood specimens must be taken. The first specimen is taken as soon as it is known that she has been exposed and the second is taken 14-21 days later. If the first serum, which is tested immediately after collection, does not contain detectable HI antibody or a low level, the second blood should not be collected until 28 days after the first. This obviates the usual 14-21 day incubation period. Also, it is advisable to test the child or contact to determine whether or not the rash is caused by the rubella virus; occasionally it is not rubella.

The results may show any of the following:

(a) A fourfold or greater rise in the HI or CF titer or both between the first and second blood specimens is compatible with current rubella infection;

(b) If there is no change in titers in either the HI or CF tests between the first and second blood specimens and the titers are low, the findings are compatible with residual antibody from past infection;

(c) If the titers of the paired bloods are stable but extremely high, further studies are required to determine whether or not this represents peak antibody response to a current infection. This situation may exist if the first blood specimen is taken several weeks after the exposure;

(d) If no antibody is detectable in either specimen, the results are indicative of no immunity and no infection as a result of the exposure.

B. To diagnose suspected congenital rubella in a newborn child—Single specimens of blood should be taken from both mother and child. If the child is less than seven months old, a second specimen is required at seven to nine months of age.[10]

The presence of rubella antibody in the serum of infants up to approximately seven months of age may be due to transplacental transfer of maternal antibody, or may result from intrauterine infection. Persistence of an elevated HI antibody titer in the infant seven to nine months of age is compatible with congenital rubella. Determination of the class of immunoglobulin containing HI antibody activity can be used to establish congenital rubella in a serum specimen.

Rubella virus isolation from the newborn infant is confirmation of congenital rubella.

C. To confirm or rule out rubella in a patient with rubella-like illness—Acute and convalescent blood

specimens are required. The acute specimen should be taken within two to three days after onset of rash and the convalescent specimen seven to fourteen days later. A fourfold or greater rise in either HI or CF antibody titers is indicative of current infection.

D. To determine the immune status of prenatal patients, nurses and other paramedical personnel of childbearing age; and of others prior to administration of rubella vaccine—Usually only a single blood specimen is required. If the result of the HI test is reported as less than 1:8, the individual has no serologic evidence of past rubella infection and is probably susceptible to rubella. A titer of 1:8 is borderline. In both instances these individuals are candidates for the vaccine.

If the HI titer is 1:16 or greater in a healthy individual who has no clinical signs of rubella or history of very recent exposure, this person can be presumed to be immune.

Effect of Gamma Globulin on Antibody Titer

Occasionally the physician administers gamma globulin to a pregnant woman following her exposure to a rubella-like illness and then requests an antibody titer on the patient. The question immediately arises, "What effect does gamma globulin have on the antibody titer?" Studies have shown that the quantities usually administered may result in titers ranging from no detectable antibody to a maximum 1:16 in individuals without pre-existing antibody. Frequently, the resulting HI titer observed is 1:4 to 1:8. Obviously, one cannot determine the immune status in such cases except where there is no detectable antibody following administration of gamma globulin. This would be compatible with a lack of immunity. However, prior administration of gamma globulin does not interfere with the serodiagnosis of subclinical or clinical rubella since the antibody rise in the latter is substantial.

Specificity of Serological Response

Antibodies detectable by either the hemagglutination-inhibition, complement fixation, fluorescent antibody or neutralization tests are highly specific for rubella. Rubella antigens do not cross-react with antibody induced by rubeola, mumps, para-influenza, influenza, respiratory syncytial, adenoviruses or enteric viruses; infection by these viruses apparently does not result in a nonspecific anamnestic response of rubella antibody. Therefore, a significant rise in rubella antibody titer cannot be attributed to such a response.

A specific anamnestic response in a pregnant woman immune to rubella following her exposure to massive doses of rubella virus in a household contact might result in a two- to fourfold booster response in the mother.[11] However, this antibody is entirely of the IgG class and not IgM which develops only as a result of primary infection.[12]

Conclusion

In addition to the serologic test for syphilis and Rh typing, the rubella hemagglutination-inhibition test should be done routinely on all prenatal patients on initial visit to establish their immune status. Those who lack rubella antibody should be tested on each succeeding visit through the second trimester of pregnancy to detect subclinical rubella which may result from an exposure unknown to the patient. Thus, unnecessary anxiety on the part of both patient and physician can be avoided in most cases since 85% to 90% of adults are immune.

Benylin®
EXPECTORANT

Each fluidounce contains: 80 mg. Benadryl® (diphenhydramine hydrochloride), Parke-Davis; 12 grains ammonium chloride; 5 grains sodium citrate; 2 grains chloroform; 1/10 grain menthol; and 5% alcohol.

An antitussive and expectorant for control of coughs due to colds or of allergic origin, BENYLIN EXPECTORANT *is the leading cough preparation of its kind.* BENYLIN EXPECTORANT *tends to inhibit cough reflex ...soothes irritated throat membranes. And its not-too-sweet, pleasant raspberry flavor makes* BENYLIN EXPECTORANT *easy to take.*

PRECAUTIONS: *Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this preparation. Hypnotics, sedatives, or tranquilizers if used with* BENYLIN EXPECTORANT *should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing* BENYLIN EXPECTORANT.

ADVERSE REACTIONS: *Side reactions may affect the nervous, gastrointestinal, and cardiovascular systems. Drowsiness, dizziness, dryness of the mouth, nausea, nervousness, palpitation, and blurring of vision have been reported. Allergic reactions may occur.*

PACKAGING: *Bottles of 4 oz., 16 oz., and 1 gal.*

His heart tells him he's an invalid.
You know he's not.

Photograph professionally posed.

Contraindications: History of sensitivity to meprobamate.

Important Precautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use has been reported to result in dependence or habituation in susceptible persons, as alcoholics, ex-addicts, and other severe psychoneurotics. After prolonged excessive dosage, reduce dosage gradually to avoid possibly severe withdrawal reactions. Abrupt discontinuance of excessive doses has sometimes resulted in epileptiform seizures.

Warn patients of possible reduced alcohol tolerance, with resultant slowing of reaction time and impairment of judgment and coordination.

Reduce dose if drowsiness, ataxia or visual disturbance occurs; if persistent, patients should not operate vehicles or dangerous machinery.

Side Effects include drowsiness, usually transient; if persistent and associated with ataxia, usually responds to dose reduction; occasionally concomitant CNS stimulants (amphetamine, mephentermine sulfate) are desirable. Allergic or idiosyncratic reactions are rare, but such reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Previous history of allergy may or may not be related to incidence of reactions. Mild reactions are characterized by itchy urticarial or erythematous maculopapular rash, generalized or confined to groin. Acute nonthrombocytopenic purpura with cutaneous petechiae, ecchymoses, peripheral edema and fever have been reported. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis,

ıbadubdub lubad

Anxiety is expected in the cardiovascular patient. A little may even be desirable.

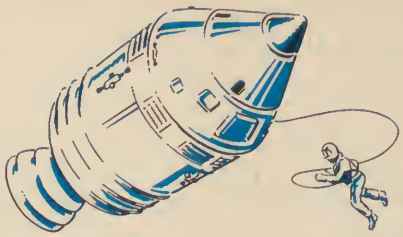
But when anxiety is exaggerated . . . when it interferes with sleep . . . when it aggravates cardiovascular symptoms, your help may be needed.

Naturally, you'll want to reassure the patient.

And perhaps prescribe Equanil (meprobamate) as adjunctive therapy. It helps relieve anxiety and tension specifically, yet gently.

Almost 15 years' use has shown that Equanil is usually well tolerated as well as effective. Side effects are generally limited to transient drowsiness; serious, therapy-interrupting side effects are rare.

stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically as with epinephrine, antihistamine and possibly hydrocortisone. Aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia have occurred rarely, almost always in presence of known toxic agents. A few cases of leukopenia, usually transient, have been reported on continuous administration.



Meprobamate may sometimes precipitate grand mal attacks in patients susceptible to both grand and petit mal. Extremely large doses can produce rhythmic fast activity in the cortical pattern. Impairment of accommodation and visual acuity has been reported rarely. After excessive dosage for weeks or months, withdraw gradually (1 or 2 weeks) to avoid recurrence of pretreatment symptoms (insomnia, severe anxiety, anorexia). Abrupt discontinuance of excessive doses has sometimes resulted in vomiting, ataxia, tremors, muscle twitching and epileptiform seizures. Prescribe very cautiously and in small amounts for patients with suicidal tendencies. Suicidal attempts have resulted in coma, shock, vasomotor and respiratory collapse and anuria. Excessive doses have resulted in prompt sleep; reduction of blood pressure, pulse and respiratory rates to basal levels; and occasionally hyperventilation. Treat with immediate gastric lavage and appropriate symptomatic therapy. (CNS stimulants and pressor amines as indicated.) Doses above 2400 mg./day are not recommended.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. (All tablets also available in REDIPAK® [strip pack], Wyeth.) Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

Wyeth Laboratories Philadelphia, Pa.

Equanil®
(meprobamate)

Wyeth®

Man in space, now fait accompli, re-emphasizes the importance of Uro-Phosphate therapy. Research into the effect of space travel on the astronaut reveals that weightlessness causes loss of bone calcium. As the bones are required to bear less and less of the weight of the body they lose calcium, increasing the calcium content of the urine. When physical activity is reduced, the acidity of the urine should be adjusted to keep increased calcium in solution . . . . a prophylaxis to prevent kidney or bladder calculi.

Uro-Phosphate®

NOW A SUGAR-COATED TABLET

Each tablet contains: METHENAMINE, 300 mg.; SODIUM ACID PHOSPHATE, 500 mg.

Uro-Phosphate gives comfort and protection when inactivity causes discomfort in the urinary function. It keeps calcium in solution, preventing calculi; it maintains clear, acid, sterile urine; it encourages complete voiding and lessens frequency when residual urine is present.

Uro-Phosphate contains sodium acid phosphate, a natural urinary acidifier. This component is fortified with methenamine which is inert until it reaches the acid urinary bladder. In this environment it releases a mild antiseptic keeping the urine sterile.

Uro-Phosphate is safe for continuous use. There are no contra-indications other than acidosis. It can be given in sufficient amount to keep the urine clear, acid and sterile. A heavy sugar coating protects its potency.

Dosage:

For protection of the inactive patient 1 or 2 tablets every 4 to 6 hours is usually sufficient to keep the urine clear, acid and sterile.

2 tablets on retiring will keep residual urine acid and sterile, contributing to comfort and rest.

A clinical supply will be sent to physicians and hospitals on request.

ARTHUR E. COCCO, MD
Journal Representative

Baltimore City Medical Society

Meeting Highlights

Seven of the members of the Board of Directors of the Baltimore City Medical Society met for their monthly meeting on January 13, 1970 at 4:30 PM at 1211 Cathedral St., Baltimore, Md. The meeting was called to order by John N. Classen, MD, president.

The minutes of the December 2, 1969 meeting were approved.

The first item on the agenda was a letter read to the Board of Directors from Timothy D. Baker, MD, chairman of the Medical Care Committee. In his letter, Dr. Baker explained that the Medical Care Committee, in its effort to broaden the scope of activities and make it an effective body, passed the following recommendation at the meeting on November 21, 1969. "The Committee requests that the next general mailing from the Society contain an open invitation for all members of the Society to write to the Chairman of the Medical Care Committee if they have interest in either becoming a regular member of the Committee or in becoming a 'corresponding member'."

Dr. Baker's letter further explained that a "corresponding member" would be a physician who, although he is interested in the problems of medical care in the city, is unable to attend regularly scheduled meetings of the committee. He would receive all minutes and other pertinent information and would be urged to submit to the chairman any comments or suggestions he may have.

After brief discussion, the Board of Directors approved the suggestion of Dr. Baker, thus a reminder will be included with the next general mailing of the society.

The next item on the agenda was the consideration of the Maryland Artificial Kidney Treatment Fund. William G. Esmond, MD, in a recent correspondence to the Board of Directors, sought the sanction of the Baltimore City Medical Society for support in the formation of a fund to aid patients in need of artificial kidney treatment. Dr. Esmond included in his correspondence the bylaws of this new charitable organization which he states is formed in the State of Maryland to assist indigent Maryland kidney failure patients. After much discussion by the Board, it was decided that definitive action on this matter would await further information from Dr. Esmond as well as the opinion of an authoritative advisory council.

The next item was a letter from John B. De Hoff, MD, chairman of the Committee of Tellers for 1969. Dr. De Hoff presented the following problems as being evident during the recent elections held by the Baltimore City Medical Society:

When the committee met to count the ballots, the members first discussed rules which they would accept to judge votes for validity or invalidity. Ballots were considered invalid if they fell into the following categories:

(a) Envelopes not signed in the proper fashion by the voting physician; (b) Mailing envelopes postmarked after the acceptable date; (c) The ballot itself signed or stamped or written on in any fashion which would mark it as unusual; (d) Excess number of spaces marked where more nominees were listed than a member could vote for; (e) Ballots marked "Vote for all but. . . ."

Certain ballots were filed incorrectly but were accepted as valid if they met the criteria of the instructions. For example, many physicians removed the signature leaf of the ballot envelope, folded it and included it in the envelope with their ballot. These were opened and if the physician was legally qualified to vote, the committee accepted his vote. This year, prior to examining the ballots, the committee elected to consider invalid any ballot that had excess spaces voted; Dr. De Hoff believes the committee,. next year,

should consider whether or not to allow the other votes on such marked ballots (if according to rules) to count. The tear flap of the ballot envelope in effect stated that ballots could be marked as desired. This probably meant "vote for whom you wish" rather than mark the ballot any way you wish. He also feels that ballots next time should say something to the effect that "vote by placing an X in the designated space opposite the nominee or candidate of your choice." This would lessen the number of sloppily completed ballots, some with lines, some with checks, some with Xs, some with indefinite other marks.

Finally, the Committee opened the envelopes, counted all the votes including those where there was no other candidate, authenticated the tally sheets with signatures of respective tellers, referred problem ballots to the chairman for decisions, and this year recounted one close contest.

Dr. De Hoff suggested that a way to remedy such problems would be to establish a tellers committee prior to the preparation of a ballot to minimize some of the above or some new problems which might arise. The Board concurred with this suggestion.

The next item on the agenda was the proposed election of Society members to Emeritus status. These include Alexander J. Schaffer, MD, member since 1932; Walter E. Fleischer, MD, member since 1947; Melvin H. Crocker, MD, member since 1947; and R. S. Penner, MD, member since 1967. After a brief discussion, it was decided that these members should be proposed for Emeritus status.

The Board considered and approved the waiver of dues for William J. Sawyer, Jr., MD, and Isaac Miller, MD, because of ill health.

There was no other old business and the meeting was adjourned at 5:30 PM.

AMA Priority Objectives:

Solutions to Nation's Major Health Problems

"We plant trees today so that others may have shade tomorrow." Burtis E. Montgomery, MD, chairman of the AMA Board of Trustees, recently quoted this Chinese proverb to illustrate that the accomplishments of today's physicians and medical societies should include the solution of eight of the most pressing health problems now confronting the nation.

As identified by the American Medical Association, they are:

The acute shortage of health manpower—the demand for health care has created an imbalance in the supply-demand equation of health professionals and other personnel. Increasing affluence, longer life, greater appreciation of good health care, and such government programs as Medicare and Medicaid have greatly increased the demand. Consequently, the AMA, in cooperation with the Association of American Medical Colleges, is urging all medical schools to increase their enrollment and offers its assistance in establishing new schools. Success of this approach to date is evidenced by 24 new medical schools created since World War II, raising to 101 the total number of schools now accepting students. Others are in the planning or construction stage, and most existing schools have increased their enrollment.

The AMA Council on Medical Education is cooperating with attempts of medical schools to reduce the length of medical training and is reviewing the time required by various specialty boards for certification of specialists.

The AMA Committee on Education for Related Health Professions and the AMA Council on Health Manpower are also stimulating a variety of programs to develop new physicians' assistants, new health care roles for nurses, and innovative steps to increase total productivity. The Association has adopted essentials of accredited educational courses and accredits programs for 13 different technologies. In addition, it endorses increased federal appropriations for both the schools and individual students.

Rising health care costs—the AMA is working closely with the American Hospital Association and hospital medical staffs to review every item of hospital costs in an effort to remove those items which should be supported by other means. Physicians are also being encouraged to eliminate hospital care or reduce it whenever possible and to use less expensive extended care facilities and home health care services.

The AMA is now preparing a public education program to illustrate how unrealistic demands for health care inflate costs.

Financing health care—the AMA supports a national health insurance plan based on tax credits and certificates that would enable all Americans to purchase comprehensive health insurance coverage. Its proposal would establish a sliding scale of tax credits depending on the individual's tax liability, and the credits would be applied to health insurance provided by private carriers.

Mental health—the AMA proposed the program that was enacted by Congress to establish a network of nationwide community mental health centers. The program involves close cooperation with the mental health administration and other experts to discover more efficient methods of treatment and rehabilitation that will allow the patient to return to productive work more quickly.

Pollution—the AMA Council on Environmental and Public Health has held several national conferences on the problem of pollution of the air, waterways and the land, and it is working closely with governmental and private agencies to ameliorate this growing health hazard.

Alcoholism and drug addiction—the widespread use of alcohol has been accomplished by millions of medically identifiable alcoholics. They suffer a type of drug addiction which requires medical therapy and which causes 50% of all fatal accidents and innumerable criminal acts. Consequently, the AMA Committee on Alcoholism and Drug Dependence continues to conduct a major educational program in this area, directed at both adults and youths.

Health care of slum residents—the AMA Committee on Health Care of the Poor, recognizing that the problem of health care in the slum is basically a problem of the slum itself, is conducting a series of studies and conferences with civic and social lead-

ers, and it is preparing specific recommendations to improve both the quality and delivery of health care in these areas.

Malnutrition—poor nutrition is more far-reaching than most people suspect. It covers not only the underprivileged but also the middle-income group, and relates strongly to education at all levels of society. The AMA has adopted an aggressive program to fight hunger and malnutrition; local societies are being encouraged to meet with community dietitians, dentists and other health specialists in resource seminars and to participate in area health surveys.

In addition, the AMA will publicize guidelines for the evaluation of malnutrition, examine the science of nutrition as part of formal medical education, seek development of a central coordinating agency for nutrition at a high level in the executive branch of government, urge development of urban and rural programs to provide health services with a nutritional emphasis, and evaluate current nutritional education in schools.

Dr. Montgomery, speaking in behalf of the AMA Board of Trustees, has asked each medical society to help implement these programs at both the state and local level. "Everything physicians do today to help find solutions to these eight major health problems will affect, in large or small part, what physicians of tomorrow will be able to accomplish," he said.

Baltimore Association of Medical Assistants — Highlights

The Baltimore Association of Medical Assistants held its monthly meeting at the Medical and Chirurgical Faculty on October 14, 1969. Lionel A. Desbordes, MD, guest speaker for the evening, spoke on "The Contraceptive Pill".

Dr. Desbordes gave a very detailed, yet simplified account of the anatomy and physiology involved in the menstrual cycle of the female. Then Dr. Desbordes explained the action of the contraceptive pill and the expected side effects. During a brief question and answer period, Dr. Desbordes enlightened his audience to many of the controversies which have developed over the pill.

Dr. Desbordes was born in New Orleans, and received his BS degree from Dillard University, and his MD degree from Howard University and Medical School. He served his internship at D.C. General Hospital, and his residency at Freedmen's Hospital in Washington, D.C. He served in the Army Medical Corps for two years. Dr. Desbordes is certified by the American Board of Obstetrics and Gynecology, and is a Fellow of the American College of Surgeons and the American College of Obstetrics and Gynecology. Presently Dr. Desbordes is in private practice in Baltimore and serves on the staff of numerous local hospitals.

Dr. Desbordes

Mrs. Frances Fairley, Mrs. Esther Luchinsky, Mrs. Rita Cobry, and Mrs. Peggy Bury recently passed the American Association of Medical Assistants Certification examination. All four certified medical assistants are members of the Baltimore Association of Medical Assistants and are employed by physicians in the Baltimore area.

The certification examination is offered to all medical assistants who have been employed for a minimum of three years by a physician in an office, hospital, or clinic. The examination consists of seven sections: Medical Terminology, Anatomy and Physiology, Human Relations and Ethics, Medical Law and Economics, Laboratory Orientation (Urinalysis, Hematology, Bacteriology, Immunology and Injections, Radiology, and Physiotherapy), Office Skills, and Accounting. These seven sections are each subdivided into two parts: Clinical and Administrative, but five total sections must be passed to become certified in either section.

Mrs. Cobry **Mrs. Fairley**

The newly elected officers for the Baltimore Association of Medical Assistants for 1970 are:

Peggy Bury—President
William Leiby—President-Elect
Lila Adams—Vice-President
Elva Edmonston—Recording Secretary
Valerie Hachtel—Corresponding Secretary
Frances Fairley—Treasurer
Rita Cobry—Representative to MAMA

The new advisor to BAMA was also elected. Newland E. Day, MD, will be the advisor and work with H. L. Wollenweber, MD, for the coming year. Dr. Day will serve in this capacity for a two-year term. He replaces the outgoing advisor, John Littleton, MD.

The chapters of the Maryland Association of Medical Assistants once again cooperated in a very successful Viet Nam Christmas project. The chairman for the project was Mrs. Peggy Bury, and the co-chairman was Mr. John Allen. Numerous cash contributions were given to support this project, and all the medical assistants contacted merchants in their area to solicit donations of goods to use as stocking stuffers. The items were packed and sent during the month of November, and Mrs. Bury happily reports that the boxes were received in Viet Nam in time for Christmas. The Chaplain to whom they were sent has acknowledged receipt of the presents. In his letter of

gratitude, the Chaplain expressed his thanks for the interest of the medical assistants in helping to make Christmas a little happier for the servicemen in Viet Nam.

Mrs. Bury

The Baltimore Association of Medical Assistants was able to aid a poor family during the Christmas season. Donations for the needy family were received by the Chairman of the project, Mrs. Peggy Bury, and a collection of usable clothing was also made. Bags of groceries were delivered to the family on Christmas Eve.

The Association also gave a Christmas present to an invalid lady as part of the project.

Frederick County Medical Society

The Frederick County Medical Society held its January meeting at the Fredericktown Inn in historic Frederick on January 20. Following the customary social hour and a well-prepared steak dinner, the members heard Mr. Robert L. Burton speak about his work as Assistant Director in the Division of Vocational Rehabilitation in the state. His review of the definition of a disability under the present laws was most informative and helpful to the membership.

Mr. Burton was introduced by Mr. Thomas J. Tidwell, manager of the Social Security office in Frederick, Maryland, who reviewed the criteria necessary for making application for disability benefits. Despite the weather, the meeting was unusually well attended. Albert M. Powell, Jr., MD, newly elected president, conducted the business meeting.

Other officers of the society include Richard Holz, MD, president-elect; Ernest A. Dettbarn, MD, immediate past-president; Edward Koenigsburg, MD, secretary; Fred Baker, MD, treasurer; and LeRoy Davis, MD, newly elected member of the Executive Committee. Drs. Thurman Mott and Robert Crouch are serving unexpired terms on the Executive Committee. Delegates elected to Med-Chi are Drs. Thomas Reid and Charles Wright; alternates are Drs. Richard Fruth and Willis Riddick.

Dr. Powell announced the establishment of a Physician Procurement Committee with George I. Smith, Jr., MD, as chairman. This committee will serve to actively encourage physicians to practice in Frederick County and will work with local communities in their attempts to secure physician services.

It was decided to reactivate the scholarship fund for aiding medical students from Frederick County with their medical school expenses. This fund, which has helped several young people in the past, is composed solely of contributions from members of the county society.

In other business, a report was given by Charles Spicknall, MD, Frederick County Health Officer and Chairman of the Long-Term Care Committee appointed to study the present long-term care facilities available and needs for the future. The report received the endorsement of the society and the committee was commended for its many hours of effort over the past year. The details of the report will be made public in the near future.

It was announced by Dr. Powell that the February meeting would be devoted to general discussion of future programs of the society, purposes of the society as it relates to the community, and a more-or-less self-study of our society and its future goals.

Ernest A. Dettbarn, MD

Blacks Make Up Two Per Cent

Of Our Doctors

There are approximately 6,000 black physicians in the United States today—about 2% of the nation's doctors—and two medical schools graduate about 83% of them.

These figures are part of a study compiled by the National Medical Association Foundation in cooperation with the American Medical Association.

Other aspects of the study show:

- The highest concentrations of black physicians in the United States are in California, New York and the District of Columbia.
- The highest proportions of black physicians (39%) are involved in general practice; the remainder are specialists in various medical fields.

Over 73% of the black physicians (compared with 65% of all physicians) are involved in patient care.

Some 16% of all physicians are in advanced medical training programs compared with 9% of black physicians.

The study also showed that black physicians are less likely to practice in groups than physicians in general. Only 2% of the black physicians practice in groups, but 9.5% of all physicians have group practices.

Of the 4,805 black medical students who graduated in 1967 (the latest year for which figures are available), 2,186 (45.5%) were graduated from Howard University College of Medicine and 1,822 (37.9%) from Meharry Medical College.

Significance of Intermediate Levels of Antitrypsin Deficiency in Pulmonary Disease

Data presented do not indicate a causal association between intermediate levels of alpha $_1$ antitrypsin deficiency and chronic obstructive lung disease, in contrast to the link observed between severe deficiency and emphysema.

Several reported studies have linked a severe deficiency of alpha$_1$ antitrypsin factor with obstructive lung disease. The deficiency is an inherited autosomal recessive trait; severe deficiency indicates homozygous inheritance of an abnormal gene, and intermediate levels indicate the heterozygous state.

With severe deficiency, exertional dyspnea is the predominant symptom of disease. Destruction of lung parenchyma and pulmonary vessels with impaired diffusing capacity suggest emphysema. In patients with intermediate deficiency, lung disease is not as clearly defined.

To assess the relationship between the intermediate deficiency state and pulmonary disease, two investigations were made. In one, the frequency of intermediate antitrypsin deficiency in a chest clinic population was compared with a control group. In the other, the clinical features of lung disease occurring in subjects with severe deficiency were compared with those of people with intermediate levels.

In comparing the frequency of antitrypsin deficiency in normal and diseased groups, sera were obtained from 51 healthy adult blood donors and from 146 consecutive unselected patients attending a chest clinic. The patients had little in common except chronic cough or dyspnea due to pulmonary disease. The majority suffered from chronic obstructive lung disease.

Of the 51 healthy individuals, three had intermediate values, as did 17 of the 146 clinic patients. The difference is not significant.

Clinical Comparison

In the second phase of the study, in patients with intermediate and severe antitrypsin deficiency, 13 chest patients with severely deficient levels and 18 with intermediate levels were compared as to clinical manifestation of lung disease.

Spirometric indices of obstruction and restriction were roughly comparable, but there was a striking contrast between the two groups with respect to clinical manifestations. Patients with severe deficiency had a clinical picture of primary emphysema with minimal chronic bronchitis. Several reported loss of weight with onset of dyspnea on exertion, the beginning of symptomatic pulmonary disease.

Thirteen of the 18 patients with intermediate levels had significant chronic obstructive lung disease. The pulmonary disease in the other five was varied and included inactive pulmonary tuberculosis, polycythemia rubra vera with hypoxemia, and mild chronic bronchitis.

In the severely deficient group, diffuse loss of vascular markings over both lower lung fields with

Martin H. Welch, MD, Mark E. Reinecke, MD, James F. Hammarsten, MD, and Clarence A. Guenter, MD. *Annals of Internal Medicine,* September, 1969 (**Vol. 71**, No. 3).

preservation of upper-lobe vessels was seen on X-ray and confirmed on lung scans.

One patient with intermediate deficiency had a daughter with severe deficiency. His chest X-ray film did not show hyperinflation or vascular attenuation, and lung scan showed minimal decrease over left apex and right base, with greater perfusion of lower than upper zones. The daughter had primary emphysema, with vascular decrease in the lower zone characteristic of severe deficiency.

Pathogenesis Unclear

Although it has been established that severe deficiency of serum alpha$_1$ antitrypsin is associated with frequent occurrence of pulmonary disease, the potential knowledge to be gained from this disease state has not been realized. The goal of investigation in this area must be the elucidation of pathogenetic mechanisms. Such knowledge may be of great value in the study of other forms of chronic obstructive lung disease.

A hypothesis suggests that alpha$_1$ antitrypsin protects the normal lung against the destructive action of proteolytic enzymes. Since protease inhibitors are not generally specific in their action, trypsin need not be the enzyme of pathogenetic importance in such a hypothesis. Because little is known about concentrations of alpha$_1$ antitrypsin in various body tissues, it should not be assumed that the serum levels *per se* are the critical factors in producing disease in deficient persons.

An alternative hypothesis is that normal aging is associated with metabolic turnover of connective tissue fibers of the lung. Under tensile stress this turnover may lead to enlargement of the air sacs with age. Deficiency of serum alpha$_1$ antitrypsin might hasten turnover and thus hasten the changes of aging, resulting in clinical emphysema.

Both hypotheses are in some ways plausible, but strong supporting data are not yet available. It is not clear that the relationship between antitrypsin deficiency and pulmonary emphysema is a causal one. Definitive research in this area must probably await a clear demonstration of the site of primary injury in lung disease associated with severe antitrypsin deficiency, and also improved definition of specific factors producing that injury.

Meanwhile, some speculation based on simple clinical observations is possible. If antitrypsin deficiency is a cause of lung damage, it would seem that an increased susceptibility to lung disease might be expected in the intermediate group, though not as great as that in severe deficiency. If this were so, a high prevalence of intermediate deficiency should be detected easily in a population of chest disease patients. However, in this study no significant difference was found between the normal and diseased population in the prevalence of intermediate values, suggesting that intermediate deficiency does not cause lung disease.

The hypothesis that severe deficiency causes disease by subjecting the lung to dissolution by proteases remains attractive, however. Possible sources of proteases which might damage lung tissue include macrophages and bacteria within the airways and alveoli, and leukocytes in the bloodstream. The site of injury would depend on the source of protease. Since pulmonary blood flow is normally greatest in the lower zones, a destructive action of proteolytic enzymes from intact or destroyed leukocytes within the pulmonary capillary bed could produce panacinar disease with a preference for the lower lobes. This hypothesis would be supported by demonstration of a primary vascular lesion by light or electron microscopy. Proteases released from bacteria or macrophages would be more likely to cause injury at the level of the respiratory bronchiole resulting in centrilobular emphysema.

It is possible that severe antitrypsin deficiency predisposes patients to such a destructive process, whereas intermediate levels provide adequate defense of the pulmonary parenchyma to prevent clinical manifestations of disease within the normal life span.

Baltimore County Medical Association

Annual Meeting Notes

The annual meeting of the Baltimore County Medical Association was held on Wednesday, December 17, 1970 at the Tail of the Fox. The meeting was called to order by the President, Theodore Patterson, MD, who welcomed the members and their wives.

Wilmer K. Gallager, Jr., MD, Program Chairman, introduced Mrs. Ann Flaccavento, director of "The Roundelaires," an acappella choir from Catonsville, which provided the entertainment.

After dinner, the business meeting began with the report of the Secretary-Treasurer, who gave the auditing report. The Chairman of the Board of Governors followed with his report. Sidney Venable, MD, gave a brief summary of the board activities. Morris Reese, MD, gave the report of the Liaison Committee. Barbara Solomon, MD, the association representative to the Interagency Council on Smoking, reported the progress of their campaign and again asked for volunteers to set up more groups to help individuals who wish to quit smoking.

Melvin Davis, MD, informed the members about the special meeting of the House of Delegates. The election of officers took place immediately after the completion of the reports. By a unanimous vote the elected were: Wilmer K. Gallager, Jr., MD, president; John M. Krager, MD, vice-president; and Herbert Levickas, MD, secretary-treasurer. Elected to the House of Delegates were: Drs. Melvin Davis, Edward Krieg, D. D. Caples, H. Mueller and Margaret Sherrard.

Dr. Patterson presented the gavel to Dr. Gallager, who then delivered the presidential address. A Past-President plaque was presented to Dr. Patterson by the new president. The plaque acknowledged the many services rendered by Dr. Patterson to the association and the community of Baltimore County.

The Doctor's cane symbol of office was presented to the President by his father, Wilmer K. Gallager, Sr., MD. This is the first time in the history of the association where both father and son have served as president. Dr. Gallager, Sr., was president in 1948 and 1949, the only president ever elected to a second term.

Wilmer K. Gallager, Jr., MD, was graduated from The Johns Hopkins Medical School, and served his internship and residency in internal medicine at The Johns Hopkins Hospital. After two years as a Captain in the U.S. Army Medical Corps, he served as Chief Resident in internal medicine at St. Agnes Hospital. He is board certified in Internal Medicine and is on the staff at St. Agnes, Bon Secours and Good Samaritan Hospitals. He is a member of the American Society of Internal Medicine, the American College of Physicians and the Industrial Medical Association. During the past year he served as President of the medical staff of St. Agnes Hospital and Vice-President and Program Chairman of the Baltimore County Medical Association.

John M. Krager, MD, is a graduate of the University of Maryland School of Medicine, class of 1952. He interned at St. Joseph Hospital and completed his residency in Pediatrics at the University Hospital. He has a Masters in Public Health from The Johns Hopkins Medical School and is a Deputy Health Officer for Baltimore County.

Herbert Levickas, MD, graduated from the University of Maryland School of Medicine in 1946, and trained in internal medicine at St. Agnes Hospital. He is a past president of St. Agnes Hospital medical staff. He has practiced general medicine in Arbutus since 1950.

The Master's Two-Step Exercise Tolerance Electrocardiographic Test: *Part II*

LUIS F. GONZALEZ, MD
Baltimore

Recently, Dr. Master emphasized the need for his test in view of the fact that a resting EKG may be "negative" in 47% to 83% of the cases of classical angina pectoris. He further emphasized the need for an exercise tolerance test in men over age 35 whose resting EKG was within normal limits, based on the fact that approximately 600,000 deaths attributable to coronary artery disease occur every year in the United States. The need for an adequate history, physical examination, resting EKG, and the importance of having the individual stop should he develop shortness of breath, chest discomfort or classical angina pectoris was emphasized.

The basic disagreement in the literature concerns the amount of ST segment depression necessary to make the test positive. Most authors agree that an ischemic ST segment depression is a completely horizontal depression of the ST segment, or actually a downward-sag contour.

Master has emphasized that the majority of investigators require an ischemic ST segment depression of 1 mm or more, and that whereas this in general is correct, he advises that a depression of more than ½ mm be considered abnormal until it is proven otherwise.

Elevation of the RST segment above the resting EKG value should be considered as ischemic or a positive response. This change usually appears in leads in which a Q wave has been present, and several of these patients have been found to have ventricular aneurysms.

A good deal of doubt exists concerning the significance of post-exercise T wave inversion. Most investigators agree, however, that inversion of a T wave equal to or greater than its previous height should be considered abnormal. Those T waves which in the resting EKG are inverted and subsequent to exercise become positive should also be considered as a positive response to exercise. Master emphasized that the responses described above other than the ST depression usually appear with ischemic depressions of the ST segment; consequently, this remains the best criterion for abnormal responses. He believes that junctional ST segment depressions "if near ischemic", have a definite significance.

At the 1969 annual meeting of the American Medical Association, Dr. Master presented data which appear to establish the effectiveness of the two-step test in the prediction of the natural history of coronary artery disease. In 47 of 50 patients in his study who have died since 1955, the correlations between the results of the two-step exercise test and the findings at autopsy were excellent. He summarized these data by stating, "It is logical to conclude that a correlation exists between the positive two-step test which revealed a 1 mm ischemic depression in the RST segment, and the findings at death of diseased coronary arteries."

The technique of a double standard Master's two-step exercise test used by the Metropolitan Life Insurance Company has been described by Robb, Mattingly, and Marks. Emphasis is given to the standard two-step stairs, an EKG stylus that makes tracings with distinctly described deflections and seg-

ments, and the use of the Master's tables for the test.

The first of these tables has been reproduced in the April 1967 issue of *Diseases of the Chest.* Whereas suction electrodes are usually used for the precordial leads, the advisability of using strap chest electrodes should be emphasized, particularly in individuals with hairy chests.

Precordial leads should be clearly marked on the chest wall to make sure that the same precordial level is used for each specific lead, and to avoid erroneous placement on different occasions during the test. The subject should be made to carry the cable and be instructed not to stop the trips if one of the leads becomes loose. Tracings should be recorded immediately, one, two, four, six, eight and ten minutes after exercise, and if necessary, at five-minute intervals thereafter until the tracing has returned to the pre-exercise state. The so-called immediate recording should be completed within two minutes after the end of the exercise. Routine leads should be V5, V6, V4, 2, a VR, a VL, and a VF, in that sequence. Each lead should contain at least five consecutive cycles having deflections and segments suitable for interpretation. An adequate baseline may be obtained by having the subject withhold respiration while the tracings are being recorded. The subject should be instructed to avoid motions of the eyelids, toes, or fingers.

The selection of the individual who is to undergo the test is of critical importance, and there is no justification for carrying out the test on an individual who has had a myocardial infarction six months earlier, irrespective of electrical stability recorded electrographically.

The test should not be carried out on individuals who have an electrically unstable EKG at rest or have evidence of ischemia at rest. Careful selection of the subject will avoid criticisms, such as those offered by Freidberg and co-workers, subsequent to the death of an individual who had undergone the test. This specific incident has received wide publicity, and has resulted in considerable criticism of a test which, if performed within the framework described by Master and co-workers, is safe and informative.

Emphasis on the safety of the test when performed as described has been presented in the October 13, 1969 issue of the *Journal of the American Medical Association.* The advisability of carrying out this test in individuals who present a history of unequivocal angina pectoris but have a complete normal EKG at rest, or an individual who describes a history that is equivocal or atypical for angina, was described in April 1967 in *Moderate Concepts of Cardiovascular Disease,* and re-emphasized in the *American Journal of Cardiology,* February 1969.

National Auxiliary President To Speak

An honored guest and speaker at our state auxiliary's annual convention will be Mrs. John M. Chenault of Decatur, Alabama. The convention will be held April 1 and 2 at the Sheraton Belvedere Hotel in Baltimore. Mrs. Chenault will address the luncheon gathering on Thursday, April 2.

Mrs. Chenault was installed as 1969-1970 president of the Woman's Auxiliary to the American Medical Association at the 46th annual convention on July 16, 1969, in New York city. She has been auxiliary president since April 1968, completing the term of the late Mrs. C. C. Long. She has served the national auxiliary as president-elect, bylaws chairman, first vice president, historian and director.

Other national positions she has held include rural health chairman, membership chairman, *Today's Health* chairman, program chairman, and member of the finance, nominating, structure review and health manpower committees. She has been an auxiliary member since 1946 and has served both her state and county auxiliaries in many capacities. She was Alabama state president in 1954-55, and was a two-time president of her county auxiliary. She has been a member of the state auxiliary board since 1948 and was made an honorary member of the state auxiliary in 1966.

Belle Montgomery Chenault is a graduate of the University of Alabama where her father is professor emeritus of organic chemistry. She met her husband while he lived in the home of her parents as a student at the university and they were married in 1941. The Chenaults have five children: Alice Chenault Maurer, biology instructor at Florida A & M College, Tallahassie, Fla.; Belle Chenault Morlok, high school English and music teacher, Birmingham, Ala.; John, Jr., a student at the University of Alabama; Leigh, 10, and Martha, 7.

Mrs. Chenault has always been a dedicated worker in her community. Her special interests include the Girl Scouts (she served as council president from 1956 through 1959 and is presently on the Board of Directors and finance committee); the DAR; Colonial Dames of the XVII Century; the Garden Club of Alabama; Decatur Mothers Club; League of Women Voters; Woman's Chamber of Commerce; PTA and County Mental Health Association. She has been a Red Cross water safety instructor, and is a member of the Baptist church, and a former Sunday school teacher.

She also is a member of Phi Beta Kappa, Kappa Delta Pi, Alpha Lambda Delta and Mortar Board honoraries, Zeta Phi Eta professional speech sorority, the American Association of University Women and Kappa Delta social sorority of which she is past alumnae association president. She is a past president of the Southern Medical Association Auxiliary.

Dr. Chenault is a member of the Board of Trustees of the American Medical Association and is chairman of the Board of Censors of the Medical Association of the State of Alabama, which also functions as the state board of medical examiners and the state committee of public health.

Mrs. Chenault

Better Wed Than Dead

A married man can look forward to living longer than an unmarried or divorced one.

According to the Health Insurance Institute, insurance company studies show that married men have a markedly lower mortality rate than men who are single, widowed or divorced.

And the disparity in the death rates continues throughout life, after reaching a peak in the 30 to 44 year age group.

The studies also found that divorced men register the highest death rates at every age.

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Admissions to the Alcoholic Rehabilitation Unit of Crownsville State Hospital

GREGORY S. MESTANAS Staff Psychologist Crownsville State Hospital

The Division of Alcoholism Control of the Department of Mental Hygiene, in its annual report for 1968 entitled "The Year of the Alcoholism Law", stated that "More alcoholics than ever before entered the state mental hospitals, although current statistics are not yet available."

Demographic data collection, statistical analyses, and qualitative evaluations are integral parts of every alcoholism program. Decisions concerning assignment of personnel, expenditures, and treatment programs are almost entirely contingent upon statistics. This report is a statistical comparison of the number of admissions to the Alcoholic Rehabilitation Unit of Crownsville State Hospital for ten months prior to and ten months following the implementation of the Comprehensive Intoxication and Alcoholism Control Act in the State of Maryland to ascertain if the increase in admissions, reported by the Department of Mental Hygiene, is significant as it pertains to one state institution.

As of July 1, 1968, when the Comprehensive Intoxication and Alcoholism Control Act went into effect, public inebriation is no longer considered a criminal offense. With the passage of this new law, few police officers were sure of their position in dealing with inebriates; therefore, few drunks were taken to court or even arrested during July and August 1968, the first two months following enactment of the law. For this reason, ten-month periods, rather than twelve-month periods, were selected for comparative study. These periods were subdivided into monthly admissions which were then further divided into New Admissions and Readmissions in order to separate the individuals who were admitted for the first time from those who had been admitted before.

This study is based on 1,892 total admissions from September 1, 1967 through June 30, 1968, and 2,191 total admissions from September 1, 1968 through June 30, 1969. These figures do not refer to absolute numbers of different individuals since readmissions were also considered. Also, the numbers do not include returns from "elopements", "trial visits", or transfers to the Alcoholic Rehabilitation Unit from other units of the hospital. Only patients formally admitted to the hospital and assigned to the Alcoholic Rehabilitation Unit were included (see Table 1).

It is interesting to note that the total number of admissions from January 1969 through June 1969 significantly exceeds the number tabulated for the corresponding months in 1968.

The range for readmissions for 1967 to 1968 is 90 to 164, whereas readmissions during the following year ranged from 118 to 187. The number of readmissions rose steadily during the ten-month period from September 1968 through June 1969, an increase over and above the number recorded for the previous year.

Table 2 reflects the means, standard deviations (SD), and the values of t calculated on two small uncorrelated samples for new admissions, readmissions, and total admissions taken from both ten-month periods. The t tests were carried out on the means of the samples for the purpose of establishing the difference between the two. On the average, 66.5 individuals were admitted to the Alcoholic Rehabilitation Unit for the first time during the months September 1967 through June 1968 compared with 71 from September 1968 through June 1969. The difference between these means ($t = .878$) is not significant.

Table 1: Monthly Admissions to the ARU

New Admissions	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June

Table 2: Means and Standard Deviations for Admission During September 1967-June 1968 and September 1968-June 1969

N = 10
d.f. = 18

	Year before the law		Year after the law		
	Mean	S.D.	Mean	S.D.	t
New Admissions	66.5	6.60	71.0	13.36	.878
Readmissions	122.7	23.67	148.1	22.26	2.308
Total Admissions	189.2	30.27	219.1	35.62	2.062

With regard to readmissions, on the average, 122.7 patients were readmitted during the ten months prior to July 1, 1968, and 148.1 for the same ten months in the following year. The value of t in this case is 2.308 which is significant at the .05 level of confidence.

It is important to note that while both the number of new admissions and the number of readmissions were higher during the period following July 1, 1968, the readmissions greatly increased whereas there was no great significance in the increase of new admissions. In essence, the percentage of individuals with alcohol problems did not significantly increase, but the same persons reappeared more often at the unit.

Discussion

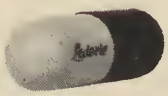
The above results indicate the possibility that Maryland's Comprehensive Intoxication and Alcoholism Control Law may have affected the number of admissions to Crownsville State Hospital. If this is true, the law did not seem to affect the number of new admissions but, rather, those individuals who were known alcoholics, possibly indicating that once the members of the police force fully understood the law, they then started enforcing it. Many individuals previously arrested and imprisoned were brought to the hospital instead.

The law provides for detoxification of inebriates usually in a general hospital. Following detoxification, the individuals are transferred to a state hospital. General hospitals only recently fulfilled their role of accepting these functions. Efforts are being made by the Division of Alcoholism Control of the Department of Mental Hygiene to bring to the attention of other agencies the need to share the responsibility of helping the alcoholic and creating new facilities for this purpose.

The significant increase in readmissions to Crownsville may be the result of an individual's desire to return to the place where he first received treatment. The hypothesis here is that many alcoholics who experience difficulty in controlling their drinking, or who are homeless, ask to be readmitted to the hospital. If this plays a part in the increasing number of readmissions, it is not encouraging. The number of beds in the Alcoholic Rehabilitation Unit and the personnel have not been correspondingly increased. As a result, the treatment of alcoholic individuals could become less adequate.

Further research is required to discover the factors affecting this increase in admissions of alcoholics who have been admitted to the unit for one or more times.

Implications



There is no concrete evidence to indicate that the number of alcoholics is increasing in the community, but there seems to be evidence that the alcoholic, who has previously been admitted to a state hospital for treatment, tends to return to drinking and then is readmitted. This does not imply, necessarily, that the treatment of alcoholics is totally ineffective; there are many alcoholics who after treatment, either by themselves or with the help of community agencies, maintain sobriety. It appears, however, that at this time many alcoholics, once they "slip", seek hospitalization. On the other hand, many agencies appear to be unable to cope with an alcoholic and seek to have him admitted if the problem is beyond their scope. In many instances hospitalization is not necessary and it is recommended that the alcoholic's family, private physician, or general hospitals, detoxification centers, shelters, half-way houses, and other facilities in the community can and should assist at the moment of crisis so that the alcoholic can get help without being hospitalized.

Every pharmacist knows ACHRO® V stands for ACHROMYCIN® V

Contraindications: Hypersensitivity to tetracycline.
Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.
Precautions: Nonsusceptible organisms may overgrow; treat superinfection appropriately. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).
Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity reactions*—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage. Upon adverse reaction, stop medication and treat appropriately.

Is There A Revolving Door?

Data from a study being prepared on Maryland's five state-operated mental hospitals indicate that the belief that many of the alcoholics admitted to these facilities return repeatedly is erroneous. During the four years ending June 30, 1968, 9,932 persons with a primary diagnosis of alcoholism accounted for a total of 16,818 admissions. Of these 9,932, 6,863 (or 69.1%) were hospitalized once during this period and 1,640 (or 16.5%) were admitted twice. Only 465 (or 4.7%) had five or more admissions. There was an average of 1.69 admissions per person.

The distribution of these individuals by race, sex, and number of admissions is shown in the following table:

	Total	White Male	White Female	Nonwhite Male	Nonwhite Female
Number of Admissions	**16,818**	**10,908**	**1,507**	**3,801**	**602**
Number of Persons Admitted	**9,932**	**5,993**	**1,017**	**2,451**	**471**
Average Number of Admissions	**1.69**	**1.82**	**1.48**	**1.55**	**1.28**
1 Admission	**6,863**	**3,975**	**778**	**1,729**	**381**
2 Admissions	**1,640**	**1,015**	**145**	**416**	**64**
3 Admissions	**653**	**430**	**48**	**159**	**16**
4 Admissions	**311**	**217**	**14**	**73**	**7**
5 Admissions	**151**	**106**	**10**	**33**	**2**
6 Admissions	**115**	**88**	**6**	**20**	**1**
7 Admissions	**51**	**43**	**4**	**4**	**—**
8 Admissions	**40**	**28**	**3**	**9**	**—**
9 Admissions	**29**	**23**	**3**	**3**	**—**
10 Or More Admissions	**79**	**68**	**6**	**5**	**—**
Rate *	**419.8**	**614.7**	**99.9**	**1,476.5**	**241.5**

Proportionally, nonwhite rates were more than twice as high as comparable figures for both white males and females. In part, this was related to the greater availability and use by the latter group of alternate treatment resources. Also, Negroes are hospitalized at an earlier illness stage as evidenced by a lower median age, a higher proportion of admissions for acute alcoholism and a smaller average number of admissions per person. This would appear to indicate varying incidence rates of the different alcoholism levels, as well as selective handling by police and other commitment sources.

Alcoholics are currently estimated to occupy one out of every nine state mental hospital beds and to account for a majority of all admissions. These figures represent a continuing substantial increase in recent years. While it is not known whether or not these data reflect a growing total number of alcoholics, most of this rise in admissions for alcoholism has been concentrated in age groups under 45. It would therefore appear that this upward trend will continue if present conditions persist. One possible alternative is the development of preventive programs, particularly among young state residents, concurrent with the large scale expansion of coordinated, community centered treatment facilities.

** Number of persons admitted per 100,000 estimated population 18 years of age or older in specified race-sex group.*

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the Maryland State Medical Journal.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the Journal and are not returned. The Journal is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, Maryland State Medical Journal, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a minimum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the Journal. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number, the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with Journal style.

Statements made or opinions expressed by any contributor in any article or feature published in the Journal are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the Maryland State Medical Journal is protected by copyright and may not be reproduced without the written permission of both the author and the Journal.

rehabilitation notes

Cervical Spine Injuries

J. DONALD McQUEEN, MD
Baltimore City Hospitals
Johns Hopkins University School of Medicine

These injuries generally fall into two categories: acute, catastrophic trauma, which is often associated with gross weakness in the extremities; and the more common chronic states found with soft tissue injury, disc protrusions and osteoarthritis. Only the first group will be considered here.

In civilian practice, the overwhelming majority of cases result from closed injuries.

Mechanisms

Violent neck trauma usually occurs in three settings: 1. diving injuries, 2. automobile accidents and 3. falls.

Force may be transmitted from the skull to the cervical spine in a linear fashion with a vertical compression fracture. More commonly, the neck is bent acutely with a fracture dislocation (Fig. 1). These occur preferentially at the C_5-C_6 and C_6-C_7 levels and usually result from acute flexion rather than extension. In 15%-20% of cases, films will be essentially normal. In some of these, vascular effects are prominent, in others, spontaneous reductions occur after hyperextension injuries, or lower cervical spine injuries are missed because of the failure to obtain adequate films. The spinal cord may be transected with devastating injuries. However, these are uncommon and at operation one usually sees a cord of relatively normal appearance, or one showing slight swelling or small contusions. Occasionally, the cord is grossly soft and exudes through the dural opening. Sizable extradural hematomas and disc protrusions do occur and cause cord compression, but these are rare enough that one is not justified in carrying out routine laminectomies in order to search for these masses. In cases coming to postmortem examination, the prime pathology is almost always found in the cord. Edema and hemorrhage are present and are characteristically in a central position; these often extend up and down the cord over several segments. The central site plus the absence of gross lacerations with closed injuries point to the fact that a prominent vascular component is often present initially.

Fig. 1: Fracture-dislocation: C_4 on C_5. The flexion deformity is associated with the most common type of severe injury.

Clinical Aspects

At the time of the first examination, two major aspects should be considered: 1. the stability of the spine and the need for reduction and fusion, and 2. the existence of compression on or swelling of the cord and the need for laminectomy. Often, no neurological changes are found and one is concerned solely with the mechanical aspects.

Meticulous, neurological examinations are mandatory and these should be repeated at frequent intervals. Many of the maneuvers which have been designed to relieve neurological defects remain controversial; however, few neurosurgeons would challenge the general usage of decompressions in the face of advancing neurological changes nor reliance on conservative means when the neurological status is improving.

The specific changes cannot be categorized here but several aspects may be noted briefly. Evidence of focal damage in the cord should be considered. An anterior mass or a vascular lesion may be suspected if complete or marked motor loss occurs with preservation of significant numbers of sensory (particularly posterior column) fibers and may, in conjunction with appropriate roentgenographic changes, lead to an operation. Lateralizing findings in the form of a Brown-Séquard syndrome may also prompt an exploration—again when matched with bony changes.

Disproportionate weakness in the upper extremities is found in a minority of cases of quadraparesis with cervical spine injury. Its evaluation has changed radically in the last decade. Schneider et al [3] have shown that the usual cause is not nerve root damage but a central cord injury with hemorrhage and softening at a point where the inner motor fibers (and perhaps anterior horn cells) for the upper extremity are damaged before the more superficial motor fibers which pass to the lumbar and sacral areas. The establishment of this distinction is of great importance since the diagnosis of central cord injury, by itself, stands as contraindication to operative intervention.

Diagnostic Studies

It is necessary to take full cervical spine films on patients who have sustained enough neck trauma to prompt a visit to the Accident Room since it is easy to miss fracture-dislocations or other serious malalignments on routine clinical examination. The initial films are often of poor quality, and unusual perseverance is often required. Adequate visualization of the lower cervical spine is time consuming and it is often good practice to pass a sheet about the shoulders to apply caudal traction as the head is tilted down 30° to 40°. Views through the axilla will also help in this situation.

Injuries at C_1-C_2 form a well-defined group and it is necessary to visualize these vertebrae clearly on lateral films and on views taken through the open mouth and to pay particular attention to the position of the odontoid process.

Oblique films should be made routinely to visualize fractures through the facets. Laminograms are needed occasionally in difficult cases.

In reviewing the film, such obvious changes as fractures and dislocations, or both, of the vertebral bodies will be considered. Some of the less prominent changes are worth stressing. On the AP view, the line of the dorsal spinous processes should be followed carefully. Often, with a rotatory malalignment (as with a unilateral hooking of the facets) a characteristic deviation in this line at the point of dislocation will be found. Similarly, the distance between the spinous processes is noted on the lateral view; this is often widened at the site of a fracture-dislocation. The laryngeal air shadow should be identified since hemorrhage and edema may extend in front of the anterior longitudinal spinal ligament. A search for fractures of the laminae is particularly important. With significant displacement, these may pass in and press on the cord; or at the time of a posterior fusion, loose fragments may be driven inward in moving the neck into a slightly extended position.

Previous trauma or pre-existing osteoarthritic changes should be carefully considered and old films may be needed.

Doubts will often arise about the advisability of early laminectomy, and information on the existence of a manometric block may be needed. For this, a lumbar puncture is carried out and the manometric responses to unilateral and bilateral jugular, and abdominal compressions are determined.

In the past, it has been virtually impossible to carry out myelography. With the common lumbar technique, the patient must be tilted in the head-down position to run the radio-opaque dye into the cervical area. Counter-traction must be applied because of the neck injury and is exceedingly difficult to use in the head-down position. Further problems are noted in manipulating the head to hold the contrast material in the neck. These difficulties may be circumvented with the use of the lateral cervical puncture as used for percutaneous cordotomy.[2] With this approach, 1-2 ml of contrast material are placed in the upper cervical region with the head elevated and after skeletal traction has been applied with the patient on a Stryker or Foster frame. The dye is allowed to drop down to the area of a block or into the normal lordotic curve with the patient face-down. Portable X-ray equipment may be used.

Eight of these have been carried out in the last three years at Baltimore City Hospitals. On one occasion, an anterior disc exploration and fusion followed the finding of a moderate intact, disc protrusion with this limited type of myelographic examination. In the others, complete blocks occurred at the site of cord swelling. The films of one

patient are shown in Figure 2. The depictions were those of fusiform enlargements and were similar to the changes encountered with intramedullary cysts or tumors. In these, posterior explorations with laminectomies revealed only cord swelling and were not rewarding. It may be possible to use such films in the future so that this specific myelographic appearance will constitute one factor in rejecting laminectomy.

Fig. 2: Myelogram utilizing lateral cervical puncture. The lateral view (above) indicates a complete block between C_3 and C_4. A fusiform dilatation of the cord is indicated at the bottom of the AP view (right). These depictions are of primary cord swelling and are not indications for operative intervention.

Management in the Accident Room

Ambulance and Accident Room personnel must be educated very thoroughly in the handling of patients with serious spinal injury. Several aspects should be stressed including: the management of the litter, the use of boards, the application of a pulley device to the stretcher, and the use of many hands.

Opinions vary on the timing for tong application; most will be inserted following the development of cervical spine films. In certain instances, it is wise to insert the tongs quickly after admission and before the procurement of spine films. These cases include many patients with obvious neck injuries plus serious neurological defects. This plan is advantageous in that it provides early immobilization and reduction; it is dangerous in that unneeded applications may be made. In practice, such errors are made very rarely.

Varied tongs are available for skeletal traction. Such models as those of Vinke, Cone and others are used by many neurosurgeons and appear to be satisfactory. We have used the instrument modified from the original Crutchfield design.[3] The application is easy and the technique should be learned by all surgical house staff. An area above and behind the mastoid processes is shaved so that the points of the instrument may be applied in line with these bony tips and with the axis of the cervical spine. A drill with guarded points is directed at a right angle to the skull surface and is used to perforate the outer table of the skull at points marked with widely opened tongs. The tongs are inserted, tightened and then connected by a pulley to a weight of about 10-15 lb; the head is then elevated for counter-traction.

X-rays of the cervical spine are repeated in the Accident Room or in the Intensive Care Unit to fol-

low the alignment. In some cases, weights will be added with persisting dislocations and particularly when facets are hooked. There is no uniformity of opinion on the maximal weight which may be applied for these reductions and 60 lb or more have been used by some. An arbitrary limit of 34-40 lb is used in our service because of the fear of added damage to soft tissues from extensive traction. This weight may be applied for several hours and may be used in conjunction with muscle relaxants and with anesthesia before resorting to an operative procedure to relocate the facets.

Patients with severe neurological deficits are cared for on Stryker or Foster frames; other patients are nursed in bed. In both instances, appropriate traction and counter-traction are maintained. Circular beds are popular; however, in our experience these provide a greater opportunity for the patient to fall. In the accident room, attention will also be directed to tracheostomies which are needed with some high lesions, to shock which may be found from the loss of vasomotor control and from concomitant injuries and to bladder care.

Operative Interventions

As the initial procedures are being carried out, the indications for posterior or anterior bony decompressions will be considered in detail. In general, there are three groups: persistent dislocations, suspected cord compressions and open wounds.

Dislocations: If the normal alignment is not achieved after a reasonable period with skeletal traction and relaxants, the patient should be taken to the operating room for a posterior approach. It is useful to obtain a lateral cervical spine film before the anticipated procedure since anesthesia may reduce spasm and aid in the reduction. At operation, the laminae are exposed at the appropriate level and the hooked facet or facets are identified. A small portion of the obstructing edge of the lower facet is rongeured to allow the superior facet to slip down in its normal position. A posterior fusion is then carried out.

Cord Compression: Usually, the decisions for or against bony decompressions are not easily formed. There are, however, clear-cut indications in some settings. One is a suspicion of bony compression. Fractures of the laminae may be present and bony fragments may pass within; alternately, with vertical compression fractions, the anterior portion of a vertebral body may press inward on the cord. The progression in neurological findings is an indication for decompression as is, in some cases, the presence of unusual or unexplained findings. Pre-existing bony changes—those from Marie-Strümpell spondylitis or rheumatoid arthritis—should be considered since extradural hematomas may form when fracture-dislocations occur in conjunction with these states. As noted above, another indication is a myelographic block with a configuration suggestive of extrinsic pressure.

The finding of a manometric block with lumbar puncture may support the decision for operative intervention; it is, however, not a prime indication. Another minor indication for intervention is the need to expose the cord directly for impressions of transection, swelling and other changes and in general, to aid in formulating the prognosis.

There are also important reasons for not carrying out laminectomies, anterior decompressions or other procedures. One is the fact these procedures have not been clearly shown to offer beneficial decompressions. Secondly, the patient with acute cord injury is often in incipient shock from the loss of much of the sympathetic outflow and therefore not in ideal condition for operation. Thirdly, sizable hematomas and disc extrusions are extremely rare. Fourthly, the patients may be seen many hours after the time of injury and at the time when it is felt that the changes are irreversible. Finally and most importantly, it is unfortunately true that a few patients worsen after laminectomies or fusions. Accordingly, it seems reasonable to adopt a conservative attitude with reliance on skeletal traction and to use operative intervention only when clear-cut indications are present.

Arguments may be adduced for either the anterior or posterior approach if a decompression is decided upon. The choice will vary and will be based on factors other than the need for decompression. The posterior approach with a laminectomy is more popular since it offers more extensive exposure of the cord. The opportunity of removing broken laminar fragments is also present. The anterior approach is useful in that disc and bony protrusions usually lie anteriorly. It is a disadvantage in that the view of the cord and the decompression are limited even with the removal of a whole vertebral body.

Many variations may be found with the timing of fusions. With the anterior approach, a fusion with or without replacement of a vertebral body will be done at the time of exploration. A posterior fusion may be done at the time of an early laminectomy. Unfortunately, the operating time is then extended to a period of six hours or more at a time when the patient is in an acute phase. It is therefore better as a rule to carry out the posterior fusion electively a week or two later when the patient's condition has stabilized. A limited laminectomy may then be added for direct visualization of the cord in instances where early decompressions were rejected.

The use of tongs is perhaps the most useful therapeutic maneuver; however, this practice brings well-known hazards. The instrument will commonly pull out even with daily tightening and it will occasionally pass intracranially with the attendant danger of a brain abscess or other infection. It is therefore wise to remove the device soon after another form of support is provided. Typically, a posterior fusion is

carried out 10 to 21 days after injury; the traction is then lightened and the tongs are removed in another week or so. Sometimes, the tongs are removed very early as with some anterior fusions. A neck brace is sometimes substituted early, rather than late, with stable spines following relatively minor dislocations. At the other extreme, the patient may be left in skeletal traction for six weeks. This plan is rarely used at this time and is followed in unusual situations as with infection and extreme instability.

A Minerva plaster jacket is sometimes used rather than a bony fusion. This jacket unfortunately permits moderate muscle motion and in some cases it is better to substitute a halo which is fixed to the skull and to a plaster jacket.

Other measures may be employed in an attempt to treat cord swelling. Potent steroid derivatives are used by some in a manner similar to the common application for brain edema. The efficacy appears not to have been established. Local hypothermia of the cord is now being tested by a few groups who use irrigations of cool saline at the time of laminectomy. Again, this usage is similar to that of general hypothermia for head-injury victims in a previous era and similarly, the overall results are not clear.

Penetrating Injuries: Most of these are inflicted with missiles, knives or ice picks. It is particularly important to search for metallic fragments on X-ray films since the path may be traced. Nearly all of these are explored promptly for a debridement. The rare exceptions occur in instances where low-velocity injuries occur without direct involvement of the cord in the absence of gross contamination.

Two aspects involving public action should be stressed. One is the need for strong (yearly) efforts in education on potential dangers from water sports. This is particularly important in this locale because of the significant proportion of neck injuries from diving accidents. The other aspect is the initiation of public appeals for aid in rehabilitation and chronic care.

Summary

Some of the details of the diagnosis and the management of severe cervical spine injuries are noted. Emphasis is placed on conservative treatment with skeletal traction. The fact that the neurological status may deteriorate following either a laminectomy or a fusion is stressed and a list of indications for operative intervention is given. The use of limited myelography utilizing a lateral cervical puncture is described.

from the discord of anxiety...

to emotional harmony

Before prescribing, please consult complete product information, a summary of which follows:

INDICATIONS: Indicated when anxiety, tension and apprehension are significant components of the clinical profile.
CONTRAINDICATIONS: Patients with known hypersensitivity to the drug.
WARNINGS: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.
PRECAUTIONS: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.
ADVERSE REACTIONS: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido--all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

with the aid of antianxiety

Librium®
(chlordiazepoxide HCl)

5-mg, 10-mg and 25-mg capsules

In an age of swift change and challenge, susceptible individuals may experience varying degrees of excessive anxiety. The resulting emotional stress may precipitate significant functional disorders or complicate existing organic disease. In properly individualized maintenance dosage, Librium (chlordiazepoxide HCl) quickly helps relieve anxiety and apprehension, provides useful adjunctive therapy in psychophysiologic disorders. In long clinical experience, Librium has demonstrated a wide margin of safety.

Also available:
Libritabs®
(chlordiazepoxide)

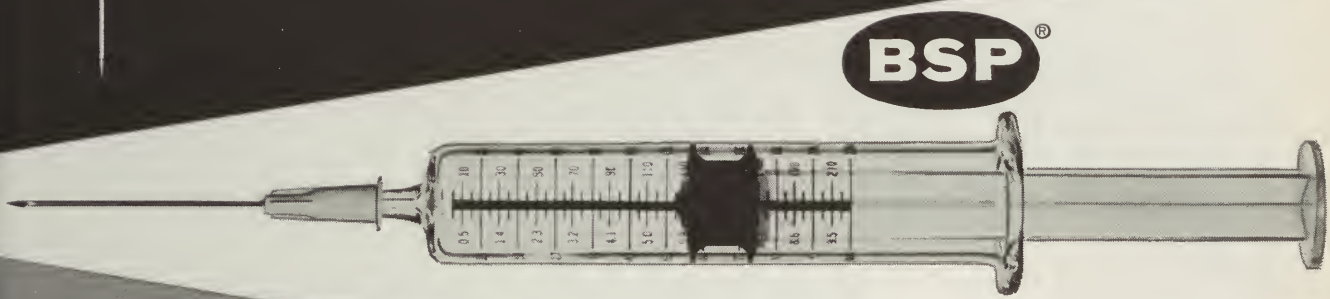
Our completely new 100-bed facility is NOW OPEN

We are Baltimore's most centrally located nursing home. Minutes from Towson, Roland Park, Homeland, and all of northern Baltimore's hospitals.

The right attitude

. . . has earned us an enviable reputation in Baltimore's wide spectrum of health care establishments. We feel that our approach to the problems of elderly, chronically ill, and convalescent patients makes us different. Our people give of themselves beyond the call of duty to our guests with more than the amount of service expected.



If the RIGHT ATTITUDE is what you're looking for . . . . . with day and night vigil by professional nurses . . . individually programmed meals under the control of a staff dietician . . . physical, occupational and recreational therapy . . . a pleasant, home-away-from-home atmosphere . . . . . Edgewood Nursing Home should be your first preference.

DECLOSTATIN® 300

Demethylchlortetracycline HCl 300 mg and Nystatin 500,000 units CAPSULE-SHAPED TABLETS Lederle

b.i.d.

To guard susceptible patients against intestinal monilial overgrowth during broad-spectrum therapy—the protection of nystatin is combined with demethylchlortetracycline in DECLOSTATIN.

For your susceptible candidates, prescribe DECLOSTATIN—the broad-spectrum therapy that prevents monilial overgrowth.

Effectiveness: Because its antibacterial component is DECLOMYCIN Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, Nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Cor stant observation is essential. If new infections appear, appropriat measures should be taken. In infants, increased intracranial pressur with bulging fontanels has been observed. All signs and symptoms hav disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, dia rhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopap ular and erythematous rashes; a rare case of exfoliative dermatitis ha been reported. Photosensitivity; onycholysis and discoloration of th nails (rare). Kidney—rise in BUN, apparently dose related. Transien increase in urinary output, sometimes accompanied by thirst (rare Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxi Teeth—dental staining (yellow-brown) in children of mothers given thi drug during the latter half of pregnancy, and in children given the dru during the neonatal period, infancy and early childhood. Enamel hypo plasia has been seen in a few children. If adverse reaction or idiosyn crasy occurs, discontinue medication and institute appropriate therap Demethylchlortetracycline may form a stable calcium complex in an bone-forming tissue with no serious harmful effects reported thus fa in humans.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should b given 1 hour before or 2 hours after meals, since absorption is impaire by the concomitant administration of high calcium content drugs, food and some dairy products. Treatment of streptococcal infections shoul continue for 10 days, even though symptoms have subsided.

CONTENTS:

Cancer Facilities in the Maryland Region, Louis P. Hellman, ScD .. 57

"Facilities for the diagnosis and treatment of the cancer patient are not equally available in hospitals in the Maryland region. This article reports on the availability of selected cancer services and facilities in the 37 hospitals surveyed, with suggestions for equalizing the availability of services to the cancer patient throughout the Maryland region."

The Cryostat Cone for Rapid Diagnosis in Carcinoma of the Uterine Cervix, Michael S. Baggish, MD; Daniel B. Kooyman, MD; J. Donald Woodruff, MD 64

"Expedient and accurate diagnosis has been the keystone of proper treatment in cases of carcinoma of the uterine cervix. Since, at present, 'conization biopsy' is most often used to determine the extent of the many lesions, such a method for rapid evaluation of the excised cervical tissue, with the primary aim being the elimination of diagnostic delays, is of great importance."

Post-Treatment Care of Patients With Pelvic Malignancy, Umberto VillaSanta, MD, FACOG 69

"Due to the need for costly equipment and specialized personnel, more women with pelvic tumors are referred to and treated in fewer medical centers which are recognized for their superior ability in handling this disease. The following presentation will attempt to synthesize the 40 years experience in the Gynecological Oncological Clinic at the University of Maryland School of Medicine."

Medicare and Nursing Homes: The Changing Scene, Leon Bernstein, PhD 73

"This paper reviews some of the more pressing problem areas affecting medical care of the aged, especially medical care in long-term facilities. These issues have special relevance to the Medicare program and particular interest for professionals who are actlve in the skilled nursing home field."

(Continued on page 18)

"All Interns are Alike"

It stands to reason. They all go through the same training; they all have to pass the same tests; they all have to measure up to the same standards; they all are underpaid, too. Therefore, all interns are alike.

That's utter nonsense, of course. But it's no more nonsensical than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

Bayer's standards are far more demanding. In fact, there are at least *nine specific differences* involving purity, potency and speed of tablet disintegration. These Bayer® standards result in significant product benefits including gentleness to the stomach, and product stability that enables Bayer tablets to *stay* strong and gentle until they are taken.

So next time you hear someone say that all aspirin tablets are alike, you can say, with confidence, that it just isn't so.

You might also say that all interns aren't alike, either.

MORE ON MALPRACTICE INSURANCE

While physicians in Maryland are experiencing increases in premiums for professional liability insurance, physicians in other states are faced with much higher increases.

For example, for $100,000-$300,000 coverage, physicians have to pay:

	California	Connecticut	Maryland ***
Class I	$ 573	$ 251	$ 96
Class II	$ 912	$ 440	$168
Class III	$1,658	$1,270	$287
Class IV	$2,106	$1,588	$383
Class V	$3,452	$1,588	$479

*** Maryland Rates through the Faculty's program only.

Meanwhile, attempts are being made to set up an Arbitration panel, as suggested by the Maryland Secretary of Health and Mental Hygiene, for the purpose of evaluating claims. This proposal, along with alternatives, is under discussion in the Faculty's Medical Economics Committee.

MEDICARE AND MEDICAID

The lack of newspapers in the metropolitan Baltimore area has created an information gap on the local as well as national level. Because of this, Baltimore-area physicians are missing all of the action on the current Medicare and Medicaid Report to the U.S. Senate Committee on Finance.

While there is much heat, but little fire to the report, it has received national headlines for its accusation that physicians are to be blamed for the soaring costs of the programs. The report received a large amount of publicity while the subsequent statements made by the American Medical Association and the National Medical Association were somewhat buried.

MEDICARE AND MEDICAID (cont'd)

The report takes issue with the various interpretations of the law by the Social Security Administration; and makes recommendations for "cost limitations". One of the cost limitations would be the establishment of set fee schedules for physicians. Another involves abolishing payments to physicians acting in a "supervisory" capacity in teaching hospitals.

The report also attacks Medicaid payments of "reasonable costs" to hospitals because they are based on the same scale as costs for Medicare, and recommends renegotiation of various payments made to institutions.

It is interesting to note that only 11% of the total costs of both Medicare and Medicaid are reimbursements to physicians while the bulk of the report is aimed at criticism of the profession. The report states, "the key to making the present system workable and acceptable is the physician and his medical society." Another comment refers to the prohibition against expansion of the system to cover more individuals and provide more benefits because of escalating costs.

FIRST AID ROOM ACTIVITY

The Faculty-sponsored First Aid Room in Annapolis was first opened for the 1963 session of the General Assembly. During that session, 101 patients were seen. Through February 24 of the current 1970 session, over 200 patients have been seen and treated.

JCAH SURVEYS

The Joint Commission on Accreditation of Hospitals is planning surveys of the following Maryland facilities in the next few months. A request has been received by the Faculty for any specific area of activity or involvement in which there is a problem situation or condition. If you have such information please contact the Faculty office.

Brief Summary. Blurring of vision, dry mouth, difficult urination, and flushing or dryness of the skin may occur on higher dosage levels, rarely on usual dosage. Administer with caution to patients with incipient glaucoma or urinary bladder neck obstruction. Contraindicated in acute glaucoma, advanced renal or hepatic disease or a hypersensitivity to any of the ingredients.

A. H. ROBINS COMPANY, RICHMOND, VIRGINIA 23220

A·H·ROBINS

TWO WAYS TO PROVIDE A DAILY THERAPEUTIC SUPPLY OF VITAMIN C:

50 KUMQUATS OR ONE ALLBEE® WITH C

Your patient would have to eat 1,500 kumquats a month, about 50 a day, to get as much Vitamin C as is contained in just one bottle of 30 Allbee with C capsules (taken one capsule daily). Allbee with C is a lot easier to come by too. Unlike kumquats, it's always in season. In addition, each capsule provides full therapeutic amounts of the B-complex vitamins. The handy bottle of 30 gives your patient a month's supply at a very reasonable price. Economy size of 100 also available. At pharmacies on your prescription or recommendation.

Fast...long-lasting relief of aches and pains of colds and flu

with the unique timed-release aspirin

Double strength Measurin timed-release aspirin offers a new kind of control for your patients with cold and flu discomforts. In each 10-grain tablet are over 6,000 microscopic reservoirs that release aspirin at a controlled rate—some right away and some later on. This means fast relief of symptoms, followed by hours of comfort. Throughout the day, Measurin gives your patients freedom from a 4-hour aspirin schedule. During the night, its 8-hour dosage schedule holds the promise of sound sleep without awakening to take extra tablets.

Increased interest rates on savings certificates

from Baltimore Federal

Now you can earn increased interest with one of Baltimore Federal's three new savings certificate plans — higher interest that means so much in down-to-earth terms, in the ways you want to enrich life for your family and yourself.

Baltimore Federal now offers 5¼% per annum on certificates of $1,000 or more invested for six months . . . 5¾% per annum on one-year certificates of $5,000 and up . . . and a whopping 6% per annum on certificates of $12,000 or more invested for two years. All certificates may be purchased in larger-than-minimum amounts in $1,000 increments.

Interest on all three certificate plans is compounded and credited quarterly, or paid direct to you by check.

And your investment is well protected by Baltimore Federal's strong reserves and insured up to $20,000 by the Federal Savings & Loan Insurance Corporation.

Stop in at any convenient Baltimore Federal office and talk over the best savings certificate plan for you. Let Baltimore Federal put a little more of the good life in your life.

BALTIMORE FEDERAL
Savings & Loan Association

Fayette and St. Paul Streets / Eastpoint Shopping Center / Reisterstown Road Plaza / Towson at 7 Alleghany Avenue / Carney at 9609 Harford Road / Yorktowne Plaza Shopping Center / Columbia, Teachers Building Westminster at 6 East Main Street / Frederick at 16 East Patrick Street

p.s. More good news for our savers! Baltimore Federal has increased its interest rat on passbook savings to a handsome 5% per annum. Thi increased rate coupled with a high degree of flexibility (yo may deposit or withdraw your savings at any time in an amount) makes a Baltimore Federal passbook account a ver attractive way to save.

Remember how great milk of magnesia tasted?

Almost as good as castor oil.
But now you can spare the taste buds and spoil the patient with a modern Dulcolax tablet or suppository.

And Dulcolax works so predictably that the time of bowel movement can often be predicted. Tablets taken at night usually produce a bowel movement the following morning. Suppositories generally work in 15 minutes to an hour.

For preoperative preparation, a combination of tablets at night and a suppository the next morning usually cleans the bowel thoroughly.

Dulcolax suppositories may be particularly helpful when straining should be avoided, as in postoperative care. Keep in mind, however, that the drug is contraindicated in the acute surgical abdomen.

Dulcolax®...it's predictable

Manufacturers of Ethical Pharmaceuticals

CAUTION:

OVEREATING MAY BE HAZARDOUS TO YOUR HEALTH.

According to the Framingham Heart Study, the obese face:

86% greater risk of angina pectoris,
82% greater risk of diabetes,
71% greater risk of coronary heart disease.*

Obesity may also aggravate osteoarthritis, flat feet, intertriginous dermatitis, varicose veins, and ventral or diaphragmatic hernias.[1-3]

you are considering weight reduction, consider

Preludin®
phenmetrazine hydrochloride
Endurets®
prolonged-action tablets

Often effective

Controlled studies in a general patient population have shown that when Preludin is used with diet, the rate of weight loss exceeds that obtained by placebo and diet.

Long acting

Slow, even release of the active principle usually suppresses appetite continuously for about 12 hours.

Once-a-day dosage

One Endurets tablet after breakfast. It helps reduce weight and costs, conveniently.

For contraindications, warning, precautions, and adverse reactions, please see the full prescribing information.
It is summarized on this page.

Where there's no will there's a therapeutic way.

*Among persons 20% or more overweight as compared with median weight for persons of like height and sex.

1. Kannel, W.B., *et al.*: *Circulation* 35:734, 1967.
2. Thomas, H.E., Jr., *et al.*: *Med. Times* 95:1099, 1967.
3. Albrink, M.J., in: Beeson, P.B. & McDermott, W. (eds.): *Cecil-Loeb Textbook of Medicine*, ed. 12, Phila.: W.B. Saunders Co., 1967.

Preludin®
phenmetrazine hydrochloride

Preludin is indicated only as an anorexigenic agent in the treatment of obesity. It may be used in simple obesity and in obesity complicated by diabetes, moderate hypertension (see Precautions), or pregnancy (see Warning).

Contraindications: Severe coronary artery disease, hyperthyroidism, severe hypertension, nervous instability, and agitated prepsychotic states. Do not use with other CNS stimulants, including MAO inhibitors.

Warning: Do not use during the first trimester of pregnancy unless potential benefits outweigh possible risks. There have been clinical reports of congenital malformation, but causal relationship has not been proved. Animal teratogenic studies have been inconclusive.

Precautions: Use with caution in moderate hypertension and cardiac decompensation. Cases involving abuse of or dependence on phenmetrazine hydrochloride have been reported. In general, these cases were characterized by excessive consumption of the drug for its central stimulant effect, and have resulted in a psychotic illness manifested by restlessness, mood or behavior changes, hallucinations or delusions. Do not exceed recommended dosage.

Adverse Reactions: Dryness or unpleasant taste in the mouth, urticaria, overstimulation, insomnia, urinary frequency or nocturia, dizziness, nausea, or headache.

Dosage: One 25 mg. tablet b.i.d. or t.i.d. Or one 75 mg. Endurets tablet a day, taken by midmorning.

Availability: Pink, square, scored tablets of 25 mg. for b.i.d. or t.i.d. administration, in bottles of 100 and 1000.

Pink, round Endurets® prolonged-action tablets of 75 mg. for once-a-day administration, in bottles of 100 and 1000.

CREDIT BUREAU OF BALTIMORE, INC.

A subsidiary of Retail Merchants Association of Baltimore, Inc.

Credit Reporting and Collections

200 W. BALTIMORE ST., BALTIMORE, MD. 21201

OPHTHALMOLOGY, Volume I, ed. Arnold I. Turtz, MD; The C. V. Mosby Company, St. Louis, Missouri, 1969.

This is another in a series of proceedings celebrating the Centennial of the Manhattan Eye, Ear, and Throat Hospital. Subjects covered during this event held in 1968 include: New Concepts in Ocular Therapy; Controversial Areas in Ocular Surgery; Pediatric Ophthalmologic Problems; Ophthalmic Plastic Surgery; New Techniques in Ophthalmology; and Complications in Ocular Surgery. The list of participants is worldwide and includes individuals from Maryland. While this publication presents a great deal of information for the already informed reader, it is also worth reading from the standpoint of gaining the latest knowledge in techniques and procedures that are available to patients suffering from eye disorders.

TEXTBOOK OF NUCLEAR MEDICINE TECHNOLOGY, Paul J. Early, BS, Muhammad Abel Razzak, MD, and Bruce Sodee, MD; The C. V. Mosby Company, St. Louis, Missouri, 1969.

This book is the result of a search for an applicable text for the training of nuclear medicine technologists. It has been divided into two portions: Nuclear Science and Clinical Theory. The clinical section uses a system rather than the usual organ approach, in an attempt to better correlate all body functions.

Because both sections represent the work of many authors compiled over a long period of time, no attempt has been made to document statements with precise references. However, a list of references will be found immediately following each section.

The content has been simplified as much as possible to make highly theoretical principles more easily understood.

PRACTICAL UROLOGY, Chester C. Winter, MD; The C. V. Mosby Company, St. Louis, Missouri 1969.

This volume is a concise accumulation of practical information on the subject, and is geared for use by medical students, general practitioners and surgeons; it is specially designed to present current concepts useful to the urologic specialist. Newer subjects such as renal transplantation, vesicoureteral reflex, renal hypertension, and radioisotope methodology in diagnostic urology are fully discussed. The conclusion of each chapter presents questions designed for the reader to test himself on the more important points developed within that chapter. This is a well organized book and one well worth adding to any medical library.

OTOLARYNGOLOGY, Volume II, ed. William F. Robbett, MD; The C. V. Mosby Company, St. Louis, Missouri, 1969.

This second volume is devoted to the proceedings of the Centennial Symposium sponsored by the Board of Directors of the Manhattan Eye, Ear, and Throat Hospital. It contains papers by international leaders in the field who presented talks on the tremendous changes that have occurred in the fields of ophthalmology, otolaryngology and plastic surgery in recent years.

The concepts of diagnosis and therapy given by the participants in this program reflect the best thinking on these topics today. The fact that they may have been controversial only led to their deliberate selection. This book is an excellent one for the individual who wishes to add to his knowledge the latest developments in these fields.

CARDIOVASCULAR SURGERY, CURRENT PRACTICE, Thomas H. Burford, MD, and Thomas B. Ferguson, MD; The C. V. Mosby Company, St. Louis, Missouri, 1969.

Lord Brock, MS, FRCS, FACS, has written the foreword to this publication, and a formidable foreword it is. The authors have acknowledged their gratitude to him for writing such an outstanding work. In the foreword, Dr. Brock traces the history of the various forms of cardiovascular surgery and forecasts the needs for the future.

This book is a must for every person who has any interest in this subject. It is well written, clearly enunciating the various surgical procedures that have been employed to replace various portions of the heart, to correct existing anomalies, and to replace the heart itself. It is an excellent book, and one that should be read by almost every physician.

AN IMPORTANT FACTOR IN LONG TERM THERAPY

Control food and mood all day long with a single morning dose

AMBAR #2
EXTENTABS®

methamphetamine HCl 15 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

A. H. ROBINS COMPANY
RICHMOND, VA. 23220

A·H·ROBINS

One Ambar Extentab before breakfast can help control most patients' appetites for up to 12 hours. Methamphetamine, the appetite suppressant, gently elevates mood and helps overcome dieting frustrations. Phenobarbital, the sedative in Ambar, controls irritability and anxiety . . . helps maintain a state of mental calm and equanimity. Both work together to ease the tensions that erode the will power during periods of dieting.

BRIEF SUMMARY/**Indications:** Ambar suppresses appetite and helps offset emotional reactions to dieting. **Contraindications:** Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. **Precautions:** Administer with caution in the presence of cardiovascular disease or hypertension. **Side Effects:** Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. See package insert for further details.

Also available: Ambar #1 Extentabs® — methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD

One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.

Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastraintestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

Quinamm™
(quinine sulfate 260 mg., aminophylline 195 mg.)

Specific therapy for night leg cramps

Treating vaginitis is as easy as AVC

Trichomonads...Monilia...Bacteria

You can depend on AVC—the comprehensive therapy that acts against all three major vaginal pathogens.

Monilia emerging as a major therapeutic problem—
recent studies report increased incidence, attributed in part to the use of oral contraceptives,[1-4] broad-spectrum antibiotics[5-9] and prolonged use of corticosteroids.[7]
recent evidence establishes high rate of microbiological and clinical cure with AVC.[9-11]

Comprehensive—Effective

The published record and more than two decades of clinical experience clearly establish the therapeutic value of AVC in vaginitis/cervicitis and vaginal surgery.

Easy as AVC

Contraindications: Known sensitivity to sulfonomides.
Precautions/Adverse Reactions: The usual precoutions for topicol ond systemic sulfonamides should be observed because of the possibility of absorption. Burning, increased locol discomfort, skin rash, urticario or other monifestations of sulfonomide toxicity are reasons to discontinue treatment.
Dosage: One applicatorful or one suppository intravaginolly once or twice daily.
Supplied: Creom—Four-ounce tube with or without applicator. Suppositories—Box of 12 with opplicotor.

Auxiliary Members Present Skit At Board Meeting

At the board meeting held at the Faculty building on November 3, 1969, eight Auxiliary members participated in a skit which illustrated the mechanics needed if a component Auxiliary wanted to present a package program. "Package Programs" were developed by the national Auxiliary to help focus public attention on current health needs, and to assist state and county Auxiliaries in planning and implementing programs related to these specific needs as part of their community health activities.

Under the direction of Mrs. Wallace H. Sadowsky, president, and with a script written by Mrs. Herbert J. Ulrich, regional vice-president of the national Auxiliary, the ladies presented the package program on Alcoholism, which included the showing of the film "A New Look at the Old Sauce". This film strip, purchased by the Auxiliary from the Texas Commission on Alcoholism, gives a crisp, colorful account of the alcohol story in 20 minutes. Designed especially for students and special-interest groups, the film does not present an in-depth look at alcoholism; its purpose, rather, is to stimulate viewer response through light coverage of selected topics. "A New Look at the Old Sauce" entertains as it informs; its purchase by the state Auxiliary makes it readily available for use by the component Auxiliaries in local communities in conjunction with the package program on Alcoholism. The package program on Alcoholism deals with the use—and abuse—of alcohol in today's society and the necessity for adequate alcohol education and alcoholism treatment programs. It contains a procedure guide, a fact sheet, a question-and-answer sheet for distribution to the audience, a source list of recommended films, an authoritative speech which can be presented by the program moderator, pamphlets concerning the symptoms, characteristics, and treatment of alcoholism, and a tally sheet to be filled in and mailed to national headquarters after the program has been presented by the Auxiliary.

Members of the cast were: Frieda Folk, Jone Berger, Marge Garey, Marge Lesch, Peggy Phillips, Ruth Palmer, Margaret Yow, portraying various officers of a county Auxiliary Executive Board; and Arlene Baybutt, as the physician who spoke on "Identifying the Alcoholic".

Other package programs available and on file at the Faculty building are Drug Abuse, Health Careers, Homemaker Service, Immunization, Mental Health of Children, Sex Education, Teenage Venereal Disease, The Block Mother Plan, Youth Health and Fitness, and Smoking.

MEDIC
1970 SCHEDULE

APRIL 24, 1970 — 12:30 PM

TUBERCULOSIS AND ATYPICAL MYCOBACTERIA

Edmund G. Beacham, MD
Chief, Tuberculosis Division
Baltimore City Hospitals
Assistant Professor of Medicine
The Johns Hopkins University School of Medicine

Discussion will be centered on clinical aspects of pulmonary tuberculosis including disease caused by atypical mycobacteria. Comments will cover tuberculin tests, differential diagnosis, and drug treatment.

Sponsor: FREDERICK MEMORIAL HOSPITAL

Replays:		
	Monday, April 27, 1970	12:30 PM

MAY 1, 1970 — 12:30 PM

HIATAL HERNIA

Vernon Smith, MD
Chief of Medicine
Mercy Hospital

The discussion will deal mainly with symptomatic sliding esophageal hiatus hernia and associated esophagitis. Practical aspects of diagnosis and management will be developed from known pathologic mechanisms. Special attention will be directed toward a critical review of various operations advocated for treatment of hiatal hernia, and toward the rational selection of patients for operation.

THE MONTH IN WASHINGTON

The Senate Finance Committee approved a staff report on medicare and medicaid which was critical of both physicians and the administration of the health care programs. It included a recommendation for fee schedules for physicians' services.

In a joint statement, the presidents of the American Medical Association and the National Medical Association pledged support of their organizations to the committee's efforts to correct deficiencies and abuses in the two programs. However, the two spokesmen for organized medicine said "it would be tragic if . . . regulations were adopted whose effect would be to deny a greatly improved level of health care to the ghettos."

The AMA-NMA statement said that "we were greatly encouraged by the committee's comment that it 'believes that the majority of physicians, for whom information was requested with respect to medicare and medicaid as presently structured, have dealt fairly with these federal programs and with the federal government.'"

In regard to abuses and fraud, the statement said:

"Where these abuses exist, they must be rooted out. Both the AMA and the NMA are prepared to take very vigorous action within their power to help the committee and the government accomplish this."

It was noted that the committee had denied an AMA request many months ago that it be given the names of physicians involved in the committee's investigation.

"Despite this," the statement said, the AMA and the NMA through their own resources have been able to identify a number of physicians grossing more than $25,000 in these programs. . . .

"In some instances, medical societies had already taken appropriate action against individual physicians where the evidence warranted. In other instances, however, the AMA and the NMA have found that many of the physicians presumably included in the committee's study are dedicated physicians working in isolation in slum and rural areas who are literally being overwhelmed by a tide of sick humanity. . . .

"We therefore believe it would be unfortunate if the committee's report leads the public to believe that medicare and medicaid are riddled with fraud or that the number of physicians abusing the programs is large. Such is not the case . . . ."

The report said that incomplete and partial listings indicated 4,300 individual practitioners plus an additional 900 physician groups each received at least $25,000 from medicare in 1968, including 68 who received $100,000 or more. The report also contained a long list of physicians by state receiving $25,000 or more from medicaid in 1968. None was named; listings were by code numbers.

"Hundreds of the payments profiles indicate that the physicians involved might be abusing the program," the report said. "For example, we found many general practitioners each paid $15,000, $20,000, or more for laboratory services. We found large payments being made for what appear to be inordinate numbers of injections. In many cases we found what is apparently overvisiting and gang-visiting of patients in hospitals and nursing homes.

"The staff believes that the majority of physicians on whom information was gathered provided medically necessary services for which they were entitled to charge and be reimbursed. On the other hand, medicare's payments structure did little to discourage—in fact, it encouraged—high fees, and thus may well have contributed to the very substantial payment totals to those same physicians."

Recently, the Social Security Administration reported that about 2,500 cases had been investigated for fraud or abuse during the first three- and one-half years of medicare. It was emphasized that this was only a minuscule fraction of the total medicare transactions. Social Security Commissioner Robert M. Ball said:

"Medicare pays about 30 million doctors' bills and 12 million bills from institutional providers of services each year. It is clear from our investigations that the number of attempts at fraud or

abuse is relatively very small."

About half of the cases investigated, he said, resulted from clerical errors, misunderstandings or honest mistakes by physicians and health services. Up to January 20, 1970, the SSA had referred the cases of 13 individuals and organizations to the Justice Department with recommendations for criminal prosecution for fraud. Two physicians have been convicted in U. S. district courts and indictments have been returned against another five physicians and one nonphysician. Another five cases had been referred with recommendations that civil proceedings be started for the return of illegally collected funds. Early this year, social security investigators also were preparing an additional 35 possible fraud cases for referral to the Justice Department.

The most common types of alleged violations reported include physicians and providers billing for services not rendered, excessive charges, alteration of bills, duplicate billing, misrepresentation of types of services or dates of services, unreported discounts, or kickbacks, and employee embezzlement, medicare officials said.

The report's recommendations were aimed at providing "bases for remedying the serious, costly, and pervasive problems" of the two programs and make them "work more efficiently and economically." However, it was conceded that physicians constitute the cardinal factor.

"The key to making the present system workable and acceptable is the physician and his medical society," the committee staff said. "We are persuaded that at this point in time neither the government nor its agents have the capacity to effectively audit medical practice to assure that a given physician functions responsibly in dealing with the publicly financed programs.

"While there is growing awareness among many physicians of the need for the profession to effectively police and discipline itself, performance has been spotty and isolated so far. Prompt action by organized medicine (and other health professions) is necessary to do what is required with respect to monitoring care provided, and charges made for the care. . . .

"However, procedures which involve peer review should not be undertaken without precise spelling out and assurances that such review will be comprehensive and effective—not paper and token."

Report recommendations include: • fee schedules for physicians' services; • generic prescribing of drugs; • "curb overutilization by requiring prior professional approval of elective procedures and expensive courses of treatment"; • require the patient to name a "primary physician" to end "costly 'doctor shopping' "; • require states to provide medicaid recipients with statements outlining payments made in their behalf; • modify present law "to make practicable reasonable cost-sharing payments by the medically indigent"; • prohibit independent collection and discount agencies from collecting medicaid or medicare due bills that providers have sold to them; • improve federal administration, and establish cooperative arrangements with and between states; • establish a medicaid fraud and abuse unit in HEW, and require states to establish similar units; • combine the medicare and medicaid advisory councils.

The American Medical Association urged changes in proposed federal regulations concerning fraud under the medicaid program.

"While we do not condone in any way any fraudulent conduct of physicians in Title XIX (medicaid) or in any professional activity, we do believe that physicians will consider the new requirements an unwarranted affront to their integrity in their participation in the program," Ernest B. Howard, MD, executive vice president of the AMA, said in a letter to John D. Twiname, acting administrator of the medicaid program.

One of the proposed regulations would require physicians to sign form statements certifying that their claims were correct and that they understood fraud could subject them to prosecution.

These statements, Dr. Howard said, would serve no useful purpose because physicians already know that false claims could lead to prosecution. On the other hand, the regulation would be "regarded as offensive by many physicians since it obviously impugns their integrity," the AMA letter said.

The other proposed regulation would require state agencies to promptly report suspected cases of fraud.

"It is obvious that serious prejudice may result to a physician where the suspicion of fraud is publicized," the AMA said. "Even when the fraud is not later established, irreparable harm to the reputation of the physician will still have resulted. . . . We believe it will be better procedure not to report each suspected case, but to include in the report only those situations where the case has been concluded and fraud has been established."

* * *

The Nixon Administration submitted a fiscal 1971 budget calling for federal expenditures of $20.6 billion from general revenues for health purposes, an increase of $1.8 billion over

current spending levels. Medicaid and medicare Part B (physicians' services) accounted for much of the increase.

The overall medicare budget, including Part A (hospitalization), increased by $1.2 billion to $8.8 billion. Estimated medicaid costs to the federal government rose from $2.6 billion to $3.1 billion. However, the Administration hopes to cut the medicaid budget by $235 million by getting Congress to approve elimination of federal aid for extended care in mental institutions and nursing homes.

The budget for the current 1970 fiscal year, ending next June 30, still had not been approved when the new budget was submitted. Congress upheld President Nixon's veto of the appropriations for the departments of labor and of health, education and welfare on the ground that it was inflationary. The main funds at issue were educational aid for the federally impacted areas. The Administration and Congressional leaders negotiated a compromise.

In the 1971 budget, the lid was kept on health research spending by holding the overall increase in funds requested for the National Institutes of Health to $48 million. Some of the institutes' programs were cut and others given only small increases. Cancer research was allotted the largest increase, $28 million, pushing the 1971 budget for the program to $202.3 million. Heart research and child health research were increased by $17 million each.

Increases totaling $15.4 million were asked for alcoholism and drug addiction programs.

The Food and Drug Administration budget was upped by 10%, from $81.3 million to $89.5 million. Of this hike, nearly $2 million would be used to check safety of food additives and $2.2 billion for research on cancer and birth defects in animals exposed to pesticides.

A boost of $12.4 million, to $57.4 million, was requested for health services research and development projects "directed primarily at containing the rate of increase of medical care costs and improving the availability and utilization of health care especially for low-income groups." The federal programs in this field include: the development of alternatives to long-term stays in hospitals; experiments with private insurance firms to develop additional policies to encourage out-of-hospital care; experiments with comprehensive prepayment plans; improvement of municipal hospital systems; and development of new types of health service manpower.

An increase of $25 million, to $320 million, was requested for health professions education and manpower training programs.

* * *

The pros and cons, with emphasis on the cons, of birth control pills were aired at a Senate subcommittee hearing.

Most of the physician witnesses at four days of hearings by the Senate Antimonopoly Subcommittee testified that not enough attention has been paid to side effects. They urged that both physicians and drug companies be more diligent in calling patients' attention to the possible dangers in taking oral contraceptives.

Some of the witnesses expressed strong concern or alarm as to side effects. Others defended the oral contraceptives.

Developments related to the hearings included: • the Food and Drug Administration revived its birth control advisory committee which last fall concluded that the benefits of oral contraceptives outweighed the possible dangers so heavily that they could be evaluated as "safe." Roy Hertz, MD, New York, N. Y., a critical witness before the subcommittee, was named temporary chairman; • in advising physicians about the new labeling, the new FDA commissioner, Charles C. Edwards, MD, urged that patients be given full information about potential adverse effects; • the American College of Obstetricians and Gynecologists said it "deplored inaccurate or sensational reports concerning the scientific data on these drugs." The pills were termed "accepted therapeutic methods"; • E. B. Howard, MD, executive vice president of AMA, in a televised interview, urged American women to be calm in the face of the wide publicity about side effects and follow their physicians' orders; • the AMA's Council on Drugs said: "Oral contraceptives should continue to be prescribed by physicians for patients who require this type of contraception. However, we urge patients be advised that there are certain risks involved—the slight risk of vascular damage and the theoretical risk of carcinoma."

One of the Faculty's octogenarian members was recently honored for his fifty years of devoted health-care service in an unusual way—the members of his community erected two huge billboards alongside a highway which read: "Thank You Dr. Brumbaugh for Over 50 Years of Care."

Bruce Brumbaugh, MD, a member of the Howard County Medical Society, is a resident of Elkridge, and during his 50 years of practice has treated patients in Howard, Anne Arundel and Baltimore counties. He has delivered an estimated thousands of babies and has ushered three generations into the world. A firm believer in the all-encompassing role of the general practitioner, Dr. Brumbaugh says we need more GPs.

"My practice is my hobby," Dr. Brumbaugh told a newspaper reporter. "That's what makes it easier for me even though I have those long hours." (He works 60 hours a week.) "I'm going to work here until they put me under the sod."

* * *

The Department of Medicine at Sinai Hospital has named **Michael Levin, MD,** to head a new division of Infectious Diseases. This makes Sinai the first community hospital in the Baltimore area to establish such a specialty.

Dr. Levin received his MD degree from the University of Maryland and served as an assistant resident, then chief resident in medicine at Sinai. In 1969 he received a fellowship at the University of Maryland in infectious diseases.

Dr. Levin, an internist, is a member of the Baltimore City Medical Society.

* * *

Frederick H. Wilhelm, MD, has announced the removal of his office to 5807 Annapolis Road in Hyattsville for the practice of internal medicine.

South Baltimore General Hospital has initiated a new "Hand Service" under the direction of Neil Novin, MD, Director of Surgery. Drs. Elliott Berg and Chris Tountas have worked closely with Dr. Novin on the project, which is believed to be one of the first in the nation.

As outlined by Dr. Novin, the purpose of the new service is to promote improved care for injuries, deformities and diseases of the hand, and to expand the knowledge of the house staff by providing close supervision and instruction.

* * *

A center for detection of birth defects in the unborn fetus early in pregnancy has been established at The Johns Hopkins Medical Institutions under the

auspices of the National Foundation-March of Dimes.

The Prenatal Birth Defects Prevention Center is designed to encourage couples to have children when they are reluctant because of the fear of having a defective baby.

The center uses amniocentesis, a relatively new technique for obtaining cells from the unborn child. Parents known to carry certain chromosomal disorders, such as Down's Syndrome, may be helped by the center. Also, families with sex-linked diseases, such as hemophilia and muscular dystrophy, could be helped.

Involved in the initial stages of development of the center were **Daniel Drachman, MD, Richard Heller, MD, Howard Jones, MD, and Robert Cooke, MD.**

* * *

Neil Solomon, MD, PhD, Secretary of Health and Mental Hygiene, has announced that he has been assured of sufficient funds to provide rubella vaccination for all children in Maryland in the one-year through twelve-year age group. This group includes an estimated 930,000 children.

HEW Secretary Robert E. Finch intimated at a meeting in February that federal funds would be available for the program.

* * *

A uniform card for organ and tissue donation has been developed which is valid as a legal document under the provision of the Uniform Anatomical Gift Act, a model law formulated by the National Conference of Commissioners on Uniform State Laws.

The Uniform Act has met with considerable success. Forty states have adopted it.

One of the greatest advances embodied in the Uniform Anatomical Gift Act is the simplified procedure by which a gift may be made. In addition to a will, the Act provides that a donation by an individual can be made by any written document and that this "may be a card designed to be carried on the person". It must be signed by him and witnessed by two persons. The advantages of the card concept are particularly apparent in the emergency accident situation where time is frequently very limited, the prospective donor is unconscious, and the existence of a will is unknown.

The donor has three options: He may give any needed organs or parts; he may specify certain organs or parts; or he may give his body for anatomical study. The gift is not limited to a specific institution or a specific medical purpose. These latter provisions are a departure from traditional procedures, however, and a donor may specify a donee or place other limitations on his gift.

The form of the card was approved at a meeting on November 7, 1969, of the Ad Hoc Committee on Medical-Legal Problems of the National Academy of Sciences—National Research Council Committee on Tissue Transplantation.

Uniform donor cards may be obtained from the Faculty office or from the National Society for Medical Research, 1330 Massachusetts Ave., N.W., Washington, D.C. 20005.

Theodore E. Woodward, MD, head of the Department of Medicine, University of Maryland School of Medicine, has been elected president of the American Clinical and Climatological Association.

* * *

Recent appointments announced by the University of Maryland School of Medicine include: **Robert H. Armstrong, Jr., MD, John B. Hearn, MD, and James A. Lyon, Jr., MD, professors of radiology; Jerome Styrt, MD, associate clinical professor of psychiatry; Bernard S. Gordon, MD, and William N. Fitzpatrick, MD, clinical assistant professors of psychiatry; and Donald T. Lewers, MD, assistant professor of medicine.**

Daniel C. Wilkerson, MD, has been appointed instructor in anatomy.

* * *

William D. Tigertt, MD, professor of experimental medicine at the University of Maryland School of Medicine, has been named director of clinical laboratories at the hospital.

* * *

During the Annual Meeting of the American College of Obstetricians and Gynecologists, being held this month in New York city, **David R. Morales, MD,** of Baltimore, will be installed as a Fellow of the College.

* * *

According to the Ford Foundation Annual Report of 1969, The Johns Hopkins School of Hygiene and Public Health will receive continued support for its cooperative effort with the University of Lagos in research on population and family planning in the Lagos metropolitan area.

* * *

The Hearing and Speech Agency has elected its officers for 1970-1971. **Francis I. Catlin, MD, John M. Krager, MD,**

and Jimmie L. Rhyne, MD, were elected to the Board of Directors.

Cyrus L. Blanchard, MD, is medical advisor to the agency.

* * *

A. Earl Walker, MD, of The Johns Hopkins University School of Medicine, was designated as an American Medical Association representative at the Second Convention on Accident Prevention and Lifesaving held earlier this month in Edinburgh, Scotland.

The announcement was made by Ernest B. Howard, MD, Executive Vice-President of the AMA.

* * *

The twelfth guide in the series, "Guides to the Evaluation of Permanent Impairment" developed by the Committee on Rating of Mental and Physical Impairment, is now available. The new guide deals with the skin.

A limited number of copies are available without charge upon written request to the Committee, 535 North Dearborn Street, Chicago, Illinois 60610.

* * *

The first Alcoholism Medical Education Conference was held on the first of this month in New York city.

Frank A. Seixas, MD, Medical Director of the National Council on Alcoholism, in stating the reasons for holding such a conference, said: "This is the first time that the need for such a conference is compellingly clear, and it may be also the first time there is sufficient experience in faculties throughout the country to be able to present material of sufficient value to justify it.

During the conference, the education of nurses, social workers, alcoholism counselors and the utilization of Alcoholics Anonymous members as part of the alcoholism team were emphasized. The extent of student interest was also discussed.

Several medical schools now include alcoholism education in their curricula made possible through grants by the National Center for Prevention and Control of Alcoholism of the U.S. Department of HEW.

* * *

A bill authorizing 425 million dollars in federal funds to support training programs for family doctors and others in the field of family medicine was introduced in the U.S. Senate and House of Representatives simultaneously on February 9 by Sen. Ralph Yarborough (D-Tex) and Rep. Fred Rooney (D-Pa).

The bill, whose funds would be appropriated through 1975, provides for grants to be made by the Secretary of HEW to medical schools, teaching hospitals, and interns and residents who plan to make family medicine their specialty.

The proposed legislation was introduced on the first anniversary of the announcement of the approval of family medicine as a primary medical specialty. The specialty became a fact when the Council on Medical Education of the AMA and the Advisory Board for Medical Specialties approved a certifying board in family medicine.

The Yarborough-Rooney legislation is designed to assist medical schools and teaching hospitals to set up quality family practice departments and programs to produce highly-qualified family physicians as quickly as possible. The shortage of primary physicians has been widely recognized as a basic shortcoming in the American medical system.

The bill covers not only financing the operation of training programs, but also construction of facilities designed to make such programs functional. Also covered are training programs to produce heads of departments and teachers of family medicine. In addition, the bill incorporates a provision for training paramedical personnel to work in the field.

The cooperation of physicians is requested in the referral of patients with Ewing's Sarcoma for a continuing study being conducted by the Radiation Branch of the National Cancer Institute at the Clinical Center, National Institutes of Health in Bethesda.

Patients who have received no treatment are preferred, but selected patients with previous therapy will also be accepted for admission as inpatients.

Upon completion of their studies, patients will be returned to the care of the referring physician, who will receive a summary of findings.

Physicians interested in having their patients considered for admission to study may write or call: Ralph E. Johnson, MD, Clinical Center, Room B1B-41B, NIH, Bethesda, Md. 20014. (301) 496-5457.

Two-month "Refresher Residencies" are being offered by the Peter Bent Brigham Hospital in Boston to six qualifying, selected, practicing Fellows of the American College of Surgeons for a year at the junior assistant resident level.

The position will carry the designation of graduate assistant in surgery. An estimated cost of $1,000 a month will be shared by the Fellow, the hospital, and the department of surgery.

* * *

"Prevention of Obsolescence in the Physician" is the title of the paper presented by Archie R. Cohen, MD, of Clear Spring, February 7 at the 66th Annual Congress on Medical Education in Chicago.

Dr. Cohen is a member of the Board of Medical Examiners.

* * *

The Social Security Administration withdrew certification from 23 extended care facilities during 1969 because they did not meet Medicare's quality standards, Robert M. Ball, Commissioner of Social Security announced earlier this year.

This brings the total to 56 extended care facilities whose participation in Medicare has been terminated since the post-hospital extended care part of the program began operation in January 1967.

Commissioner Ball also stated that in 1969, 460 extended care facilities voluntarily withdrew from participation in the program—some because it appeared they could not upgrade their care or facilities to meet the standards.

As of December 1, 1969, there were 4,850 facilities participating in the program.

Following initial certification, extended care facilities with no significant deficiencies are resurveyed every 18 months. Those in substantial compliance, but with correctible deficiencies are resurveyed more frequently until the necessary improvements are made.

* * *

The American College of Obstetricians and Gynecologists announced in its January Newsletter **that the college's Executive Board has confirmed the creation of a specialty division of pediatric and adolescent gynecology; the approval of the concept of a Registry of Human Intersexuality and provision of a limited support for the Registry on a matching basis; agreed to support the principles involved in legislation on family planning and population research.**

According to the Health Insurance Institute, 2,415,000 Maryland citizens under 65 had private hospital expense insurance at the beginning of 1969. Surgical Expense insurance was issued to 2,148,000 persons under 65 at the same time; and 1,905,000 were covered with regular medical expense insurance, and 967,000 with major medical expense coverage.

Total health insurance benefits paid in the state by private health insurance organizations in 1967 were $168,267,000.

The latest available figures show that there were 3,433 physicians in private practice in the state in 1967; 1,743 dentists as of mid-1968; 2,242 registered practicing pharmacists at the beginning of 1969; and 9,840 employed professional nurses as of 1966.

The Women's Auxiliary of the American Electroencephalograpic Society will accept manuscripts until June 1, 1970 for the Annual Hans Berger Award.

One meritorious manuscript dealing with electroencephalography, either clinical or experimental, will be selected for the $300 award. Eligibility is limited to individuals at pre-doctoral (PhD or MD) and early post-doctoral levels. Candidates shall not be more than five years post-doctoral or two years post-residency.

The paper selected will be included as part of the Society's scheduled scientific program. Manuscripts should be sent to: Dr. Reginald G. Bickford, Program Chairman, Neurosciences Department, School of Medicine, University of California at San Diego, La Jolla, California 92037.

* * *

Richard B. Hornick, MD, director of the division of infectious diseases at the University of Maryland School of Medicine, participated in a symposium on typhoid fever conducted in January by the U.S. Naval Medical Research Unit No. 3 in Cairo, Egypt.

* * *

In his annual report, delivered to the Board of Trustees of South Baltimore General Hospital, **Robert T. Parker, MD,** Chief of Staff, announced that 30 physicians have been added to the hospital's visiting staff; the new Hand Surgery Service has been implemented; the scope of patient care has been expanded with the opening of the Minimal Care Unit; the patient load has increased in all areas; three summer training programs for medical students brought representatives from the University of California at Los Angeles, Emory University in Atlanta, the University of Maryland, and the Universities of Dublin, Edinburgh, and Copenhagen.

Four of the hospital's six American-educated interns elected to remain for additional training; and a temporary affiliation was established with the University of Maryland for pediatric residency training.

South Baltimore General Hospital entered the field of community postgraduate medical education with the Maryland Heart Association Symposium in September 1969.

Dr. Parker credited the hospital's continuing success to "the combined efforts of all—trustees, administration, nursing, paramedical personnel and a dedicated staff."

* * *

Assistant professor of surgery at the University of Maryland School of Medicine, **Robert M. Ollodart, MD,** has been named an American Heart Association investigator.

The association will support his research in transplantation and transplantation immunology for the next five years beginning this July.

* * *

James C. Allen, MD, associate professor of medicine at The Johns Hopkins University School of Medicine, has been appointed associate professor of medicine at the State University of Buffalo School of Medicine.

* * *

If any physician is in doubt that the American Medical Association is not his organization, he hasn't enjoyed exposure to the wide range of services performed for him, his patients and the public by the AMA headquarters staff in Chicago, at the corner of North Dearborn, State and West Grand Avenue.

Within the nine-story, block-long building are housed the day-to-day administrative, creative, and liaison staff—numbering almost 1,000 employees. The various divisions and departments represent the nerve center of American medicine, and their activities are open for each visiting physician to view.

The AMA's tour guide program during 1969 provided a staff of 14 young ladies to escort visitors throughout the building; these guides have other administrative duties, but volunteer as hostesses to all visitors during the year, including 45 medical students from Germany and another touring group of 50 young Scandinavians. Another large assignment was some 100 high school seniors in Project Wingspread, an organization to "open doors" to disadvantaged young people.

A tour of the AMA building was provided also to individual physicians and delegations from 16 foreign nations—Austria, Belgium, Brazil, Canada, England, France, Germany, India, Japan, Korea, Nigeria, Norway, Pakistan, the Philippines, South Africa and Viet Nam.

Special tours are now being planned to host the thousands of physicians and their families and guests who will be attending the AMA Annual Convention in Chicago, June 21-25.

* * *

New appointees to the Governor's Comprehensive Health Planning Advisory Council are **William M. Hart of Cambridge, and Edwin D. McGee of Pocomoke City.**

MED-CHI TOUR

The Medical and Chirurgical Faculty is sponsoring another exciting tour in the near future:

ORIENTAL CARNIVAL—May 1 to May 17, 1970

A fabulous deluxe tour leaving from Friendship Airport. This is an all-inclusive tour with six fun-filled days and nights in Tokyo, seven glorious days and nights in Hong Kong, three enchanting days in Honolulu. An opportunity is provided to visit the fabulous 1970 Japan World Exposition in Osaka via the famous "Bullet" train (140 m.p.h.). Included are sightseeing tours, a get-together cocktail party, dinners in restaurants of your choice, breakfasts, and many other attractions.

Make your reservations NOW: For information and reservations contact Mrs. Beverly Wolins, Travel Guide Agency, 416 North Charles Street, Baltimore 21201 (301-727-0680) or Mrs. Genevieve Ritchie, the Faculty office, 1211 Cathedral Strect, Baltimore 21201 (301-539-0872).

PROTEIN CONTENT / 7 oz. Serving*

Bean with Bacon	6.8	Green Pea with Ham (Frozen)	7.6
Beef	8.0	Hot Dog Bean	8.4

There's a soup for almost every patient and diet ....for every meal and, it's made by Campbell

Pro-Banthine® Helps...

propantheline bromide

...REVEAL the ulcer

...HEAL the ulcer

The efficiency of Pro-Banthine—its favorable balance of therapeutic and secondary actions—has been thoroughly tested and observed. This quality has been demonstrated surgically, roentgenographically, cinegastroscopically and, above all, clinically.

When physicians needed to relax the restless duodenum for the recently refined technic of hypotonic duodenography they logically turned to Pro-Banthine.

For years Pro-Banthine has been the most widely used anticholinergic medication for calming the gastrointestinal tract—for suppressing secretion, prolonging the action of antacids and providing the proper environment for healing peptic ulcers.

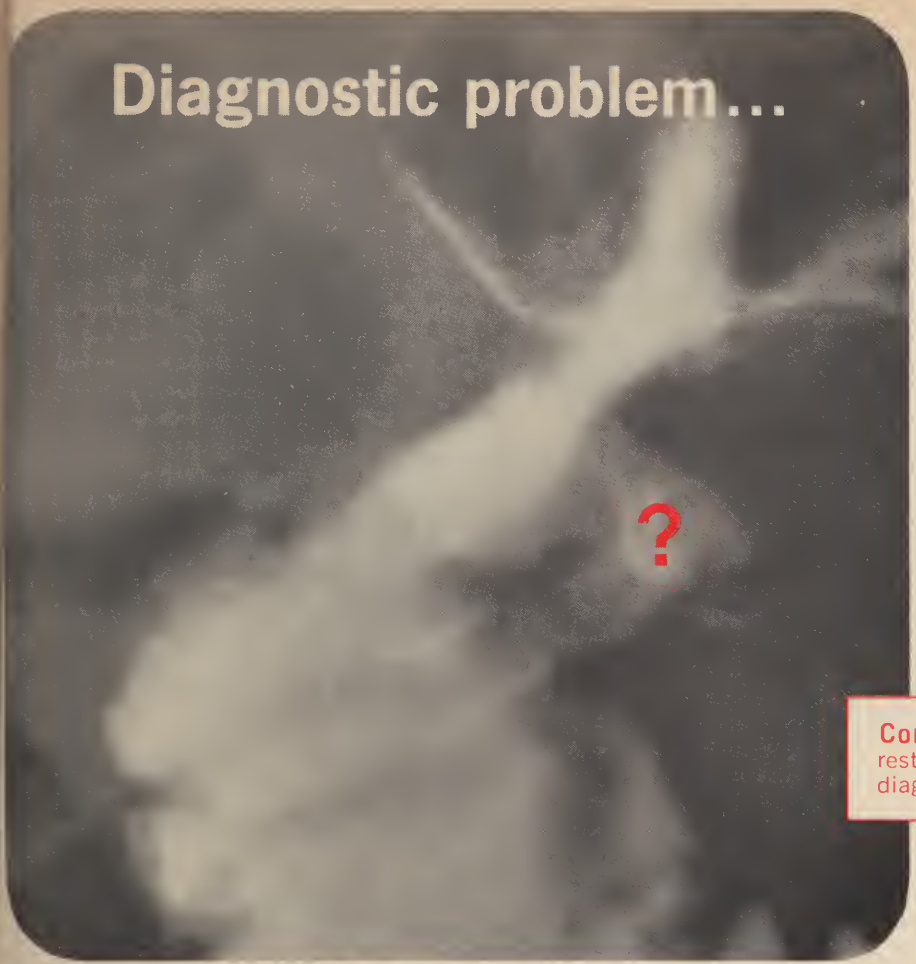
These established therapeutic actions make Pro-Banthine particularly useful in:

- peptic ulcer
- gastritis
- diverticulitis
- irritable colon
- biliary dyskinesia
- functional hypermotility

We wish to thank Drs. Marcia K. Bilbao, Louis H. Frische, Josef Rösch and Charles T. Dotter for this exceptionally graphic example of hypotonic duodenography.

Contraindications: Glaucoma, severe cardiac disease.

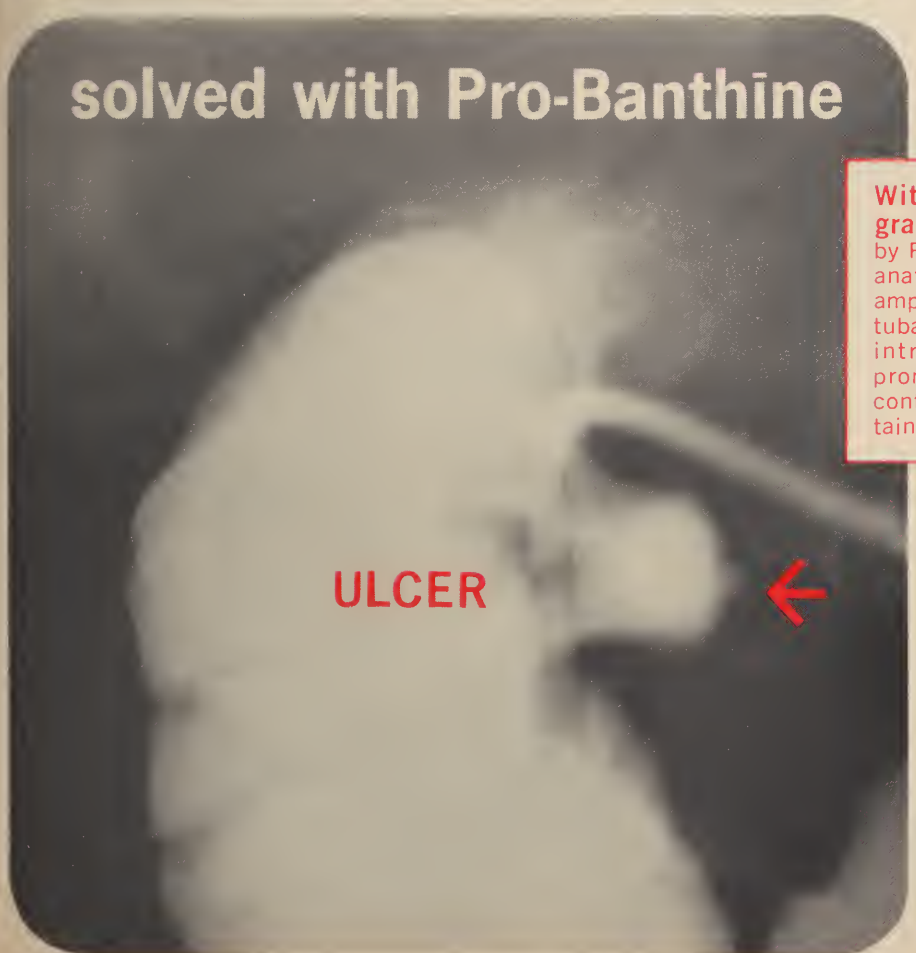
Precautions: Since varying degrees of urinary hesitancy may occur in elderly men with prostatic hypertrophy, this should be watched for in such patients until they have gained some experience with the drug. Although never reported, theoretically a curare-like action may occur with possible loss of voluntary muscle control. Such patients should receive prompt and continuing artificial respiration until the drug effect has been exhausted.



Side Effects: The more common side effects, in order of incidence, are xerostomia, mydriasis, hesitancy of urination and gastric fullness.

Dosage: The maximal dosage tolerated without excessive side effects is usually the most effective. For most adult patients this will be four to six 15-mg. tablets daily in divided doses. In severe conditions as many as two 15-mg. tablets four to six times daily may be required. Pro-Banthine (brand of propantheline bromide) is supplied as tablets of 15 mg., as prolonged-acting tablets of 30 mg. and, for parenteral use, as serum-type vials of 30 mg. The parenteral dose should be adjusted to the patient's requirement and may be up to 30 mg. or more every six hours intramuscularly or intravenously.

98



SEARLE *Research in the Service of Medicine*

Diagnostic problem...

Conventional x-rays of the restless duodenum are often diagnostically indefinite.

solved with Pro-Banthine

With hypotonic duodenography duodenal calm induced by Pro-Banthine permits clear anatomic appraisal. In this example the duodenum was intubated. Pro-Banthine, 60 mg. intramuscularly, produced prompt aperistalsis. Double contrast visualization was obtained with barium and air.

Nose clear as a whistle

(THANKS TO DIMETAPP®)

Dimetapp Extentabs® does an outstanding job of helping to clear up the stuffiness, drip and congestion of colds and upper respiratory allergies and infections. Each Extentab keeps working up to 12 hours. And for most patients drowsiness or overstimulation is unlikely. Try Dimetapp. It clearly works.

FOR UPPER RESPIRATORY ALLERGIES AND INFECTIONS

Dimetapp Extentabs®

Dimetane® (brompheniramine maleate), 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.

UP TO 12 HOURS CLEAR BREATHING ON ONE TABLET

Indications: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, sinusitis, rhinitis, conjunctivitis, and otitis.
Contraindications: Hypersensitivity to antihistamines. Not recommended for use during pregnancy.
Precautions: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.
Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered.
Dosage: 1 Extentab morning and evening.
Supplied: Bottles of 100 and 500.

A.H. ROBINS COMPANY
RICHMOND, VA. 23220

A·H·ROBINS

Baltimore County Medical Association

The February meeting of the Baltimore County Medical Association was called to order by the President, Wilmer Gallager, Jr., MD, at 1:30 PM on February 18, 1970, at the Greater Baltimore Medical Center. The President thanked T. E. Prout, MD, for the invitation to hold the meeting at the hospital.

Dr. Gallager welcomed Drs. Daniel Negrete and Alvin Wenger, two new members.

The minutes of the previous meeting were approved and Herbert Levickas, MD, the Secretary-Treasurer, reported a total of $21,894.43 in the treasury. Theodore Patterson, MD, reported that the Board of Governors met on January 21, 1970. Most of the meeting was devoted to a discussion of proposed bills which are being introduced into the 1970 Legislature. A dinner-meeting was held with the Baltimore County legislators in Annapolis. He feels that there was a good exchange of ideas.

The following applications were approved: Active —Syed Ali, MD, John Bryant, MD, and Charles Ryan, MD; Associate—Julia Novos, MD, and Douglas Puryear, III, MD; Affiliate—Elsa Merani, MD.

The President announced the untimely death of one of our members, Balbino Tayag, MD.

John Krager, MD, the Vice-President and Program Chairman, announced that the March meeting would be held at the Brentwood Inn and the April meeting at the Sheppard Pratt Hospital.

Dr. Levickas announced that the Association's annual dinner-dance will be held on April 11 at the Tail of the Fox.

The President then introduced Dr. Prout, of the Greater Baltimore Medical Center, who welcomed the members and then turned the meeting over to Alvin Wenger, MD, Head of the Department of Otolaryngology. Dr. Wenger presented the first paper on a "General Review of the Anatomy of the Ear". A film developed by the Department demonstrated the anatomy of the nose, using intranasal photography. The other speakers and topics were: Joseph Atkins, MD, Senior Resident, "Epistaxis"; Walter E. Loch, MD, "Sinusitis"; Harry P. Porter, MD, "External Otitis"; George C. Alderman, MD, "Serous Otitis"; Samuel Lumpkin, MD, "Foreign Bodies of the E.N.T."; Mr. Thomas Hagepanos, "The Audiogram"; and R. C. Chambers, MD, "Early Detection of Oral Carcinoma". A question and answer period followed.

Dr. Gallager thanked Dr. Wenger and the Department of Otolaryngology. There being no further business, the meeting was adjourned.

Dr. Theodore Patterson, Past-president of the Baltimore County Medical Association, presents an award on behalf of the Medical and Chirurgical Faculty to Mrs. Louise Couper of Dundalk, in Baltimore County, for her outstanding contribution to cancer patients and the Cancer Drive in Baltimore County.

The girth control pill

Tepanil® Ten-tab®
(continuous release form)

(diethylpropion hydrochloride)

works on the appetite not on the 'nerves'

When girth gets out of control, TEPANIL can provide sound support for the weight control program you recommend. TEPANIL reduces the appetite—patients enjoy food but eat less. Weight loss is significant—gradual—yet there is a relatively low incidence of CNS stimulation.

Contraindications: Concurrently with MAO inhibitors, in patients hypersensitive to this drug; in emotionally unstable patients susceptible to drug abuse.

Warning: Although generally safer than the amphetamines, use with great caution in patients with severe hypertension or severe cardiovascular disease. Do not use during first trimester of pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of therapy, unpleasant symptoms with diethylpropion hydrochloride have been reported to occur in relatively low incidence. As is characteristic of sympathomimetic agents, it may occasionally cause CNS effects such as insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has been reported. In a few epilepti an increase in convulsive episodes has been reported. Sympathomimetic cardi vascular effects reported include ones such as tachycardia, precordial pai arrhythmia, palpitation, and increased blood pressure. One published rep described T-wave changes in the ECG of a healthy young male after ingestion diethylpropion hydrochloride; this was an isolated experience, which has not be reported by others. Allergic phenomena reported include such conditions as ras urticaria, ecchymosis, and erythema. Gastrointestinal effects such as diarrhe constipation, nausea, vomiting, and abdominal discomfort have been reporte Specific reports on the hematopoietic system include two each of bone marro depression, agranulocytosis, and leukopenia. A variety of miscellaneous adver reactions have been reported by physicians. These include complaints such as d mouth, headache, dyspnea, menstrual upset, hair loss, muscle pain, decrease libido, dysuria, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tabl daily, swallowed whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet thre times daily, one hour before meals. If desired, an additional tablet may be given midevening to overcome night hunger. Use in children under 12 years of age is n recommended.

T-006A / 1/70 / U.S. PATENT NO. 3,001,9

THE NATIONAL DRUG COMPAN
DIVISION OF RICHARDSON-MERRELL IN
PHILADELPHIA, PENNSYLVANIA 1914

OPINION

Dear Sir:

The Medical and Chirurgical Faculty is chartered under the Maryland laws as a nonprofit organization to bring into one compact society the medical profession of the State of Maryland; to extend medical knowledge and advance medical science; to elevate the standards of medical education and secure the enactment of just laws relating to the practice of medicine and the public health; and, to foster friendly relations among physicians.

In compliance with Maryland laws and parliamentary procedure, equality of members is basic; and, all component society members as of right must have true representational equality.

The bylaws of all components cannot contravene the bylaws of the parent Med-Chi Faculty bylaws.

Under the bylaws of Med-Chi, April 1969, Article VI—House of Delegates, Section 5, subsection (c), page 15: One delegate from each chartered component society and one additional delegate for each 50 active members and Forty-year members or major fraction thereof.

Section 6, page 16 . . . Delegates and alternates shall serve for a term of one year or until their successors are elected.

We have a very questionable bylaw contradiction, under bylaws of Baltimore City Medical Society, March 1, 1968. Article V—Officers and Delegates, Section 8, page 7: As nearly as possible, one half of this Society's allotted delegates and alternates to the House of Delegates of the Medical and Chirurgical Faculty shall be nominated and elected each year by this Society in the same manner and at the same time as that provided for officers. They shall serve for a term of *two years* or until their successors are elected.

In other words, under Baltimore City Medical Society bylaws delegates and alternates, in compliance with State Society bylaws, should serve for a term of one year until their successors are elected; and, each City Society delegate (or alternate) at the House of Delegates is entitled to his vote during the year. Baltimore City Society doubles its delegate's terms through its probable contravention of Med-Chi bylaws. Is this true representational equality or fairness to the other components and to alternate replacements? If the 32 delegates are to represent Baltimore City Medical Society as proportionately indicated, they should be elected for one-year terms in compliance with the State Society bylaws.

The accompanying Table I showing the number of delegates allowed per number of members of each component society, indicates that our State Medical Society does not follow the one man-one vote principle of equal representation. At present each component is entitled to one delegate plus one additional delegate for each 50 active members and Forty-year members. Table I shows one delegate to each component; and, the fact that the majority of components do not have 50 members produces a startling disproportion of delegates to members. For example, take the total number of delegates apportioned to the total individual members of the larger components—those with membership of 100 or more. Here we find, as the accompanying Table II shows, 2,843 members representing approximately 84% of the entire membership of 3,372 have 65 delegate votes or 60% of the total number of delegates. This leaves 16% of the total membership of the State Society with 40% of the delegate votes.

TABLE I
COMPONENT MEDICAL SOCIETIES

	Number of Members	Number of Delegates
Allegany County	85	3
Anne Arundel County	127	4
Baltimore City	1555 active & 40-yr. members	33
Baltimore County	302	7
Calvert County	6	1
Caroline County	7	1
Carroll County	50	2
Cecil County	31	2
Charles County	12	1
Dorchester County	24	1
Frederick County	62	2
Garrett County	5	1
Harford County	56	2
Howard County	20	1
Kent County	14	1
Montgomery County	543	12
Prince George's County	251	6
Queen Anne's County	4	1
St. Mary's County	21	1
Somerset County	8	1
Talbot County	40	2
Washington County	102	3
Wicomico County	76	3
Worcester County	8	1
	3409	92

TABLE II
LARGER VS. SMALLER COMPONENTS

	Number of Members	Number of Delegates
Anne Arundel County	127	4
Baltimore County	302	7
Montgomery County	543	12
Prince George's County	251	6
Washington County	102	3
Baltimore County	1555	33
	2880	65

If we compare the number of delegates of the combined Baltimore city and Baltimore and Washington Metropolitan components to the number of remaining components, another disparity, as seen in Table III, becomes evident. Baltimore city and the Metropolitan areas of Baltimore and Washington have a combined membership of 2,761 or 82% of the entire membership, but are represented by only between 58% to 59% of the delegates. The remaining components, comprising only 18% of the total membership, are represented by 41% or 42% of the delegates.

TABLE III
BALTIMORE CITY AND BALTIMORE WASHINGTON METROPOLITAN AREAS vs. REMAINING COMPONENTS

	Number of Members	Number of Delegates
Baltimore City	1555	33
Anne Arundel County	127	4
Baltimore County	302	7
Howard County	20	1
Montgomery County	543	12
Prince George's County	251	6
	2798	63

Clearly, reapportionment is in order. We have ample precedent in constitutional and statutory law; and, in accepted parliamentary procedure, to ask for a change to the one man-one vote principle.

The U.S. Supreme Court has set a guide line by ordering reapportionment of the Maryland legislature in keeping with this principle. Our State Society can do and should do no less. We must examine whether our State Society is so apportioned that it does rightfully indeed give to component societies the number of delegates on the one man-one vote basis, as in the legislature. While the Supreme Court ruling may not be binding on us legally, it does provide us with a precedent for a rational and fair overhaul of our State Society's representative system. Is a physician, duly licensed by his peers, entitled to any less vote than that constitutionally granted any citizen of the U.S. in matters of voting?

Our Maryland State Corporation Law (Public General Laws—Article 23), on the other hand, appears to indicate that our defiance of the one man-one vote principle is illegal. Med-Chi is a non-stock corporation with each member the equivalent of a stockholder in a stock corporation. A perusal of Article 23 and its supporting case law is replete with reference to equal voting rights of stockholders (ie, the equivalence of society members), supporting the one man-one vote principle. For example, Art. 23, Sec. 39 is upheld in the case of First Mortgage Bond Homestead Assn. vs. Baker—157 Md. 309:—A stockholder is entitled to the opportunity to attend and be heard if he wishes and to vote on the measures provided at a corporate meeting. Because voting in Med-Chi is at present based on a representative system, we do not expect each member to vote. However, we do expect each member's vote of each component society to be equally represented. Can we truly say that we members of the Component Societies are given this representational equality under our present system?

Furthermore, there is ample precedent in the accepted guides for parliamentary procedure to provide us with an additional rational, as well as practical basis for the one man-one vote principle.

Robert's Rules of Order, revised 1951, states: "Equality of members is a fundamental principle of deliberative assemblies."

Lloyd E. Smith in his *A Manual of Parliamentary Law* states: "The fundamental principle underlying the relations of members to each other is EQUALITY."

Another inequity that must be rectified within the Society is the manner in which resolutions or motions may be introduced. In our state legislature and Baltimore city council, any citizen has the right through his representative to introduce a bill. Should any qualified member in good standing of our state or local society have less a right within his professional assembly? There is ample precedent within the accepted rules of parliamentary procedure and within the practice of legislative bodies in this State to bring about this change.

At present, in order for a State Society member to introduce a resolution directly to the Medical and Chirurgical Faculty, more than one signature is required. The bylaws state that a resolution introduced by an individual member must have the endorsement of either one third of the membership of his Component Society or 30 members, whichever is smaller. For example, introduction of a resolution in Baltimore City Medical Society requires 30 signatures or 30% of its 1,555 voting members, while only 30% of Calvert County's 6 members or Garrett County's 5 members is required. If the member sends his resolution through the Component Society, only the majority vote of the quorum is required. In Baltimore City Medical Society 23 votes of a 45 member quorum is required; in Calvert County component 30% of the vote of 6 members is required; and, in Garrett County of 5 members, etc.

A resolution should require no more than the signature or motion of the member or members introducing it.

Further, Lloyd E. Smith in his *A Manual of Parlia-*

mentary Law demonstrates that accepted parliamentary procedure supports this: "Each member, being a fully recognized member of a body, has an equal right with his neighbor to initiate action, discuss questions, make objections, vote—in short, to do anything that any other member may do. No member should attempt to curtail the freedom of any other member in this respect; and, conversely, all members should respect the rights of any one member, which must always be equal to, and never less nor more than, their own rights."

On the basis of the preceding, it is clear that our Med-Chi bylaws are in need of amendment.

1. To establish true equality of representation proportional to the membership of components.
2. That each member or group of members through his or their signature, may through his or their representatives introduce a motion or resolution for consideration and disposition by the entire House of Delegates or its quorum.

Our license for medical practice is based on professional qualifications and conduct; and as members of the profession, equality of right to practice must be matched by equality of voting.

Sincerely,
M. B. Levin, MD

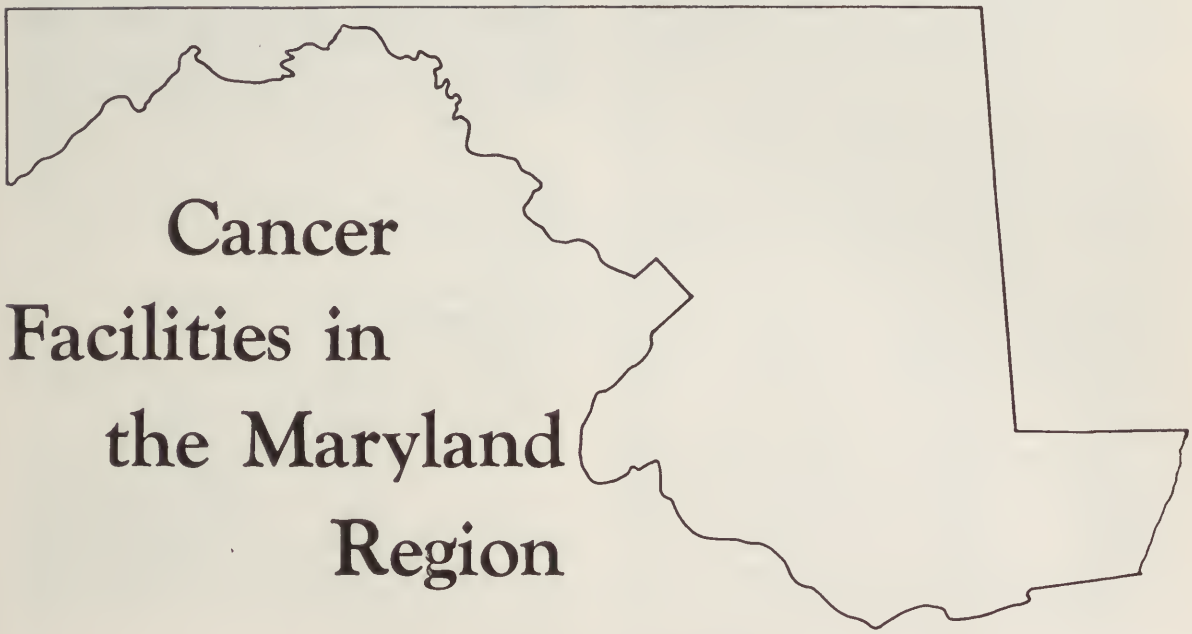
Owner Breaks Arm When Yacht Runs Aground

Schuyler, Oct. 31. Harry Waters of Covesville incurred a fractured arm ... tially capsized. The fire departm... had to rescue Waters by small b... Damage to the yacht is estimated ...

For the patient who has been through an accident, the worry and anxiety following the mishap may actually heighten the perception of pain. This is why there's a classic ¼ grain *sedative* dose of phenobarbital in Phenaphen with Codeine—to take the nervous "edge" off, so the rest of the formula can control the pain more effectively.

A.H. Robins Company, Richmond, Va. 23220 A·H·ROBINS

Phenaphen® with Codeine



Phenaphen with Codeine Nos. 2, 3, or 4 contains: Phenobarbital (¼ gr.), 16.2 mg. (warning: may be habit forming); Aspirin (2½ gr.), 162.0 mg.; Phenacetin (3 gr.), 194.0 mg.; Hyoscyamine sulfate, 0.031 mg.; Codeine Phosphate, ¼ gr. (No. 2), ½ gr. (No. 3), or 1 gr. (No. 4) (warning: may be habit forming).

The compound analgesic that calms instead of caffeinates

Indications: Phenaphen with Codeine provides relief in severer grades of pain, on low codeine dosage, with minimal possibility of side effects. Its use frequently makes unnecessary the use of addicting narcotics. **Contraindications:** Hypersensitivity to any of the components. **Precautions:** As with all phenacetin-containing products excessive or prolonged use should be avoided. **Side effects:** Side effects are uncommon, although nausea, constipation and drowsiness may occur. **Dosage:** Phenaphen No. 2 and No. 3—1 or 2 capsules every 3 to 4 hours as needed; Phenaphen No. 4—1 capsule every 3 to 4 hours as needed. For further details see product literature.

Facilities for the diagnosis and treatment of the cancer patient are not equally available in hospitals in the Maryland region. Of 37 short-stay non-federal general hospitals surveyed in the region, 18 were found lacking in comprehensive services for the diagnosis of cancer, and only 8 hospitals reported complete diagnostic and therapeutic services for the cancer patient. This article reports on the availability of selected cancer services and facilities in the hospitals surveyed, with suggestions for equalizing the availability of services to the cancer patient throughout the Maryland region.

Cancer Facilities in the Maryland Region

LOUIS P. HELLMAN, ScD
Associate Coordinator
Maryland Regional Medical Program

Although the area included under the jurisdiction of the Maryland Regional Medical Program differs from that of the State of Maryland*, an approximation of the magnitude of the cancer problem in the region can be gained by using morbidity and mortality data for the state. In 1960, an estimated 7,160 Maryland residents were diagnosed for the first time as having cancer (Table 1). In this same year almost 18,000 patients known to have cancer were alive during part or all of the year. Among these 18,000 were patients who were diagnosed as having cancer before 1960 and those who were first diagnosed with cancer during 1960.

* *The Maryland region consists of all of the counties in the State of Maryland with the exception of Montgomery County, but includes, in addition, York County, Pa., the Southern half of Sussex County, Del., and the Northern tip of Accomack County, Va.*

Table 1: Estimated Incidence and Prevalence of Cancer in Maryland, 1960

Location	Incidence		Prevalence	
	Number	Rate per 100,000	Number	Rate per 100,000
Maryland	7,160	230.9	17,910	577.7
Baltimore	2,540	270.5	6,350	676.2
Rest of State	4,620	213.8	11,560	534.9

Source: Department of Chronic Diseases, The Johns Hopkins School of Hygiene and Public Health

The death rate from cancer has increased from 139.8/100,000 in 1950 to 152.6/100,000 in 1967. Of the 5,635 cancer deaths recorded in 1967, almost half were due to malignancies of the digestive system (Table 2). Although almost two thirds of all the cancer deaths were residents of the counties outside of Baltimore city, the death rate for residents in Baltimore was 50% higher than that in the counties.

Table 2: Cancer Mortality in Maryland, 1967

Item	Number of Deaths	Rate per 100,000	Item	Number of Deaths	Rate per 100,000

Source: Vital Statistics—Maryland State Health Department Annual Report, 1967

One of the primary aims of the Regional Medical Program is to make available to patients the latest advances in the diagnosis and treatment of cancer. To ascertain the state of the art, so to speak, with respect to manpower and facilities, a survey was conducted in the spring of 1968 covering 41 short-stay non-federal general hospitals in the Maryland region. The 29 hospitals with 100 beds or more were visited; those hospitals with less than 100 beds received copies of the survey form by mail after telephone contact with the hospital administrator. In all the hospitals in the survey, the point of central contact for the information was the hospital administrator. Parenthetically, it should be pointed out that at the outset the mission of the Maryland Regional Medical Program was explained. It was stressed that the data to be collected in the survey would be useful for purposes of planning and evaluation not only for the staff of the Regional Medical Program, but also for administrators and boards of trustees in hospitals. The data obtained refer to the last six months of 1967.

Data was received from 37 of the 41 short-stay general hospitals in the Maryland region. The four hospitals from which no data was obtained were under 100 beds in size and were located outside of the Baltimore metropolitan region. Table 3 gives the distribution of the hospitals in the Maryland region by geographic area and number of beds.

Table 3: Short-Stay Non-Federal General Hospitals[1] Included in Survey by Geographic Area and Size, Maryland Region, 1968

[5] *Survey form not received from 1 hospital.*

Information obtained from the survey relating to cancer services and facilities included: 1) tumor boards and tumor registries; 2) selected cytological and radiological diagnostic programs; and, 3) selected therapeutic services.

Tumor Boards and Tumor Registries

Tumor boards and tumor registries are activities set up by the hospital's medical staff principally to aid physicians in the diagnosis and treatment of cancer patients. These activities are included in the requirements established by the American College of Surgeons for approval of a hospital cancer program.[1] Members of a tumor board systematically review suspected or proven cases of cancer with a twofold purpose in view: 1) to insure that the patient receives the prescribed levels of care, and 2) to serve as a manpower source for consultation to physicians requiring such services. A well-functioning tumor registry insures adequate follow-up of cancer cases discharged from the hospitals, encourages analysis of various methods of treatment of cancer, and lends perspective on the measurement of the size and nature of the cancer problem in the hospital, as well as the evaluation of the quality of care given cancer patients. The presence of a tumor board or a tumor registry or both in a hospital reflects, therefore, an interest among the hospital staff in the continuing improvement of the quality of care given the cancer patients.

In the Maryland region, 14 hospitals reported having a tumor board or a tumor registry or both (Table 4). The 14 hospitals included 11 in the Baltimore metropolitan region and 3 in the region outside of Baltimore. Eleven of the 14 hospitals had both a tumor board and a tumor registry. Tumor boards and registries are less likely to be found in small hospitals and as expected, 20 of the 22 hospitals with under 300 beds reported having neither a tumor board nor a tumor registry.

Table 4: Hospitals Reporting Tumor Board or Tumor Registry by Hospital Size, 1967

Hospital Size (BEDS)	No. of Hosp.	Tumor Board & Tumor Reg.	Tumor Board Only	Tumor Reg. Only	None: No.	None: % of Total

Under 300	22	1	..	1	20	90.9
300-399	9	5	1	..	3	33.3
400 and over	6	5	..	1	..	..

Diagnostic Services

The diagnosis of cancer is second in importance to prevention, and indeed may be a part of prevention. Although it is recognized that the prerequisites for early and efficient diagnosis of cancer include a diagnostic team composed of physicians trained in oncology, and a capable allied health professional staff, in addition to a well-equipped and efficiently functioning clinical laboratory and radiology department, the discussion in this section will be limited to the findings of the survey pertaining to the diagnostic services of the laboratory and radiology departments. For the most part, the tests reported were used to establish diagnosis and extent of disease in ill patients and, with possibly one exception, were not used as a screening procedure to detect disease in asymptomatic individuals. In this report, the procedures will be grouped according to the technique involved: 1) cytologic, including cervical cytology, bronchial cytology, stomach cytology and bone marrow studies; 2) radioisotope scans; and 3) other radiologic procedures including mammography and tomography.

The number of hospitals reporting these diagnostic services is shown in Table 5. In general, more hospitals reported performing the selected cytological procedures than the selected radiological procedures with the least number of hospitals reporting the availability of radioisotope scans program for their patients. The diagnostic services were reported by a larger proportion of hospitals in the Baltimore metropolitan region than by hospitals outside this region.

Table 5: Selected Diagnostic Services in 37 Short-Stay Non-Federal General Hospitals in the Maryland Region by Geographic Area, 1967

Diagnostic Services	Number of Hospitals Reporting			Percent of Total		
	Maryland Region	Baltimore Region	Maryland Region excl. Baltimore	Maryland Region	Baltimore Region	Maryland Region excl. Baltimore
Total Hospitals	37	22	15	100.0	100.0	100.0
Cervical Cytology	35	22	13	94.6	100.0	86.7
Bronchial Cytology	32	21	11	86.5	95.4	73.3
Stomach Cytology	22	14	8	59.4	63.6	53.3
Bone Marrow Study	32	21	11	86.8	95.4	73.3
Radioisotope Scans	20	13	7	54.0	59.1	46.7
Mammography	24	17	7	64.8	77.2	46.6
Tomograms	25	17	8	67.5	77.2	53.3

Cytological Procedures

Table 6, which gives the range and the median number of cytological tests performed according to hospital-bed size, is illustrative of the great variation in the use of these tests among hospitals. There is a wide range in the frequency with which each procedure was performed regardless of hospital-bed size classification. In every instance, the median number of tests performed increases with hospital size. Cervical cytology was by far the most frequently performed cytological procedure. Bronchial cytology was next in order of frequency followed by bone marrow studies and stomach cytology. The order of magnitude of these tests can be illustrated by a comparison of the median number of cervical cytological tests performed with each of the other tests for each hospital-bed size. Thus, by hospital size, the medians for cervical cytology are approximately 15 to 20 times larger than those for bronchial cytology, 30 times greater than those for bone marrow studies, and 70 to 90 times larger than those for stomach cytology. To illustrate, for hospitals in the 300 to 399 bed size category, for every 1,000 cervical cytological tests performed, there are about 50 bronchial, 35 bone marrow, and 15 stomach cytological tests performed.

Table 6: Frequency of Cytological Diagnostic Procedures Reported by Short-Stay Non-Federal General Hospitals in the Maryland Region By Size, July-December 1967

Hospital Size	Range		Median
	Low	High	
	Cervical Cytology		
Under 300	4	5,059	476
300-399	181	4,389	1,618
400+	1,846	10,621	4,547
	Bronchial Cytology		
Under 300	2	200	20
300-399	40	400	88
400+	59	1,061	325
	Stomach Cytology		
Under 300	1	30	4
300-399	2	200	23
400 +	6	117	48
	Bone Marrow		
Under 300	2	48	12
300-399	18	85	55
400 +	62	369	148

Radioisotope Scans

The use of radioisotope scans as a diagnostic procedure was reported by 20 hospitals in the Maryland region. Thirteen of these are in the Baltimore metropolitan region and seven outside of this region.

In the diagnosis of cancer, radioisotope scans are used for the most part to detect neoplasms of the head, thyroid, and liver.* Scans of these three sites accounted for more than three out of every four scans performed in the hospitals in the Maryland region. The remainder of the scans were performed to detect conditions other than neoplasms and involved the kidney, lung, stomach, pancreas, and other organs. The distribution of radioisotope scans by site is shown in Table 7. For the region as a whole, more head scans were done than for any other site with thyroid next in frequency. However, when one compares the hospitals in the Baltimore metropolitan region with hospitals outside the region, it may be seen that 1) radioisotope scans are performed much more frequently in the former than in the latter, and 2) the two leading categories were head and liver in the Baltimore metropolitan region hospitals, while in the other hospitals, thyroid was by far the largest category with head next in order of frequency. The observed differences are probably due to, firstly, the presence of more sophisticated equipment in the Baltimore hospitals, and secondly, more physicians in the Baltimore area knowledgeable in the newer application of nuclear medicine.

Table 7: Number of Radioisotope Scans Per 100 Beds by Site, Short-Stay Non-Federal General Hospitals, Maryland Region July-December, 1967

Site	Maryland Region	Baltimore Metropolitan Region	Maryland Region excluding Baltimore
Total	125.4	144.3	73.7
Head	46.2	55.7	20.5
Liver	24.0	30.3	6.9
Kidney	6.8	6.5	7.6
Thyroid	27.9	27.8	27.9
Other	20.5	24.0	10.8
No. of Hosp.	20	13	7
No. of Beds	7,537	5,512	2,025

Table 8 shows the range and median number of radioisotope scans for selected sites by hospital-bed size for the last six months of 1967. It can be seen that the median number of head scans increased as hospital-bed size increased, with 60 in the smaller hospitals to 205 in the larger hospitals. Thyroid scans ranged from 16 to 300 also increasing with hospital size. However, this increase was neither uniform nor gradual. For example, hospitals with 400 beds or more had a median number of 255 thyroid scans performed in the report period, while for hospitals with 300 to 400 beds the median was 68, and for hospitals with less than 300 beds the median was 56 scans, a number close to that for the next larger hospitals. The use of thyroid scans for many other purposes than just the detection of neoplasms may account for the relatively large number performed in hospitals with 400 beds or more. Liver scans ranged from 4 in one hospital to 450 in another. Comparison of liver scans by hospital-bed size shows that the median number of scans for hospitals with 300 beds or more is significantly greater than those in hospitals with less than 300 beds.

Table 8: Selected Radioisotope Scans Reported by Short-Stay Non-Federal General Hospitals in the Maryland Region by Size, July-December 1967

Hospital Size	Range		Median
	Low	High	
	Head		
Under 300	10	130	60
300-399	9	171	139
400+	50	767	205
	Thyroid		
Under 300	16	77	45
300-399	32	105	68
400+	102	300	255
	Liver		
Under 300	10	70	23
300-399	4	105	90
400+	34	450	90

* *It is realized that in many instances scans of the liver and thyroid are performed to detect conditions other than neoplasms.*

Other Radiological Procedures

Table 9 shows the frequency with which mammograms and tomograms were reported for the last half of 1967. The median number of tomograms was greater than that for mammography. This was true for hospitals of all sizes.

Although mammography was performed in two out of every three hospitals in the Maryland region, the number of these tests performed in most of the hospitals during the six-month period was small. In addition, the usual relationship of increase in number of tests performed with increase in hospital size did not

Table 9: Selected Special Radiological Diagnostic Procedures Reported by Short-Stay Non-Federal General Hospitals in the Maryland Region by Size, July 1967-December 1967

Hospital Size	Range		Median
	Low	High	
	Mammography		
Under 300	1	29	7
300-399	3	123	30
400+	4	112	24
	Tomograms		
Under 300	4	94	23
300-399	16	304	78
400+	17	500	175

prevail. Thus, the median number of mammographies performed by hospitals with 300-399 beds was 30 compared to 24 for hospitals with 400 or more beds.

Factors accounting for both the small number of mammograms taken in some hospitals, and the variation in the frequency among hospitals may include: 1) a lack of consensus among physicians on the efficiency of mammography as a diagnostic test; 2) physicians may not be as knowledgeable as one would expect in the use of mammography as a screening test; and 3) the criteria used by physicians as to the acceptability of patient risk to X-ray exposure precludes the use of the test.

Tomography ranked third as a procedure reported by the hospitals, and the median number of tomograms performed increased with hospital size. It is of interest to note that the frequency with which tomograms are performed approximates that for bronchial cytology. This is not surprising since one of the principal uses of the tomogram is to stage neoplasms of the chest.

Cancer Therapy

Chemotherapy: In Table 10, it may be seen that two out of every three hospitals in the Maryland region reported the use of chemotherapy in the treatment of cancer patients. As would be expected, a greater proportion of the hospitals in the Baltimore region use chemotherapy than do those in the region outside of Baltimore, and the proportion of hospitals reporting the use of chemotherapy increased with increasing hospital size. All hospitals with 300 beds or more reported using some type of chemotherapy.

Table 10: Cancer Chemotherapy Facilities Reported by 37 Short-Stay Non-Federal General Hospitals in the Maryland Region, 1967

Item	Hospitals Reporting	Hospitals with Chemotherapy	
		No.	Percent
TOTAL	37	25	67.5
Geographic Area			
Baltimore Region	22	17	77.2
Maryland Region excl. Baltimore	15	8	53.3
Hospital Size			
Under 100	8	1	12.5
100-199	10	6	60.0
200-299	4	3	75.0
300 and over	15	15	100.0

Therapeutic Radiology: Only 16 of the 37 hospitals in the entire area reported having radiological therapy facilities (Table 11). Superficial therapy or orthovoltage was reported by 11 hospitals, 6 of which were located outside of Baltimore. Of major importance is the fact that there are five cobalt-60 teletherapy units in the Maryland region. Four are located in the City of Baltimore and one is in Cumberland.

Table 11: Radiological Therapy Facilities in 37 Short-Stay Non-Federal General Hospitals, Maryland Region, 1968

Hospital Size (Beds)	Maryland Region			Baltimore Region			Maryland Region Excluding Baltimore Region		
	St			St			St		
	SV or Ov		None	SV or Ov		None	SV or Ov		None
Total	5	11	21	4	5	13	1	6	8
Under 100	—	—	8	—	—	2	—	—	6
100-299	1	4	9	—	3	7	1	1	2
300-399	1	6	2	1	2	2	—	4	—
400 and over	3	1	2	3	—	2	—	1	—

Abbreviations: SV—Supervoltage
St—Superficial Therapy
Ov—Orthovoltage

Overall Facilities

To be able to consider the foregoing discussion in the proper framework, it is necessary to assess the hospitals in the Maryland region in terms of the total facilities in each hospital which are available for the diagnosis and treatment of cancer patients. In Table 12, hospitals are classified according to the reported presence or absence of the various diagnostic and therapeutic facilities. Although the facilities considered are not all inclusive, their presence in a hospital is being used as an index of completeness of the diagnostic services in a hospital. For example, a hospital where cytological tests are performed, but not radioisotope scans, would be considered as not having complete diagnostic services.

Table 12: Programs for Cancer Patients in 37 Short-Stay Non-Federal General Hospitals in the Maryland Region, 1967

Combination of Complete Programs (X Present, — Absent)			Number of Hospitals with Indicated Combination of Programs by Location		
Tumor Board or Registry	Diagnostic	Therapeutic	Total	Balto. Metro. Region	Md. Region excluding Baltimore
X	X	X	8	5	3
X	X	—	4	4	—
—	X	X	2	1	1
X	—	—	2	2	—
—	X	—	5	3	2
—	—	X	3	1	2
—	—	—	13	6	7

Only 8 of the 37 hospitals surveyed in the Maryland region have facilities for the diagnosis and treatment of cancer which may be considered complete. If the criteria for completeness include the presence of a cobalt-60 teletherapy unit then this number is reduced to only four hospitals, all located in Baltimore city. It is important to note that 13 of the 37 hospitals included in this survey had none of the facilities. (Included in this group are some hospitals which had

diagnostic or therapeutic programs not considered complete according to the criteria established above.) If one adds to this the five hospitals which had either a tumor board or therapeutic services, but no diagnostic program, it becomes evident that almost half of the hospitals in the Maryland region lack complete diagnostic facilities for cancer.

Discussion

The activities and functions of the Regional Medical Program may be used to correct to some extent the deficiencies and unevenness of hospital services for the cancer patient. For the most part, these activities and functions include the initiation of cooperative arrangements between hospitals, the institution of continuing education programs for medical and allied health professionals, and the training of new personnel to relieve manpower shortages.

Tumor Boards and Registries: In the case of tumor boards and tumor registries, cooperative arrangements between the "haves" and the "have nots" could take the form of jointly-sponsored tumor boards, cancer registries and cancer clinics. In addition, the hospitals with specialists, such as radiotherapists, urologists, etc., could make their services available for consultation to the cooperating hospitals. A central tumor registry could be established among the cooperating hospitals with the long-range view of forming such a registry for the entire region to be followed by the merging of tumor registries among regions contiguous to the Maryland region.

In the subregions outside of the Baltimore area, an additional type of cooperative arrangement may be desirable. Specifically, subregional centers could be established in strategic cities on the Eastern Shore and in Western Maryland. This type of arrangement might lead to the formation of a bond among the hospitals which could ultimately result in the pooling of scarce services in the area. In time, arrangements on a subregional basis would restructure the role of the universities so that their expertise would be needed in unusual cases only. In this connection, the Maryland Regional Medical Program is conducting a demonstration program linking The Johns Hopkins Hospital and the Memorial Hospital in Easton to make available immediate consultation for difficult cancer cases. In addition, a single cancer registry is being developed for the two hospitals as part of this program.

A number of basic difficulties are recognized to establish cooperative arrangements. For example, hospitals may not wish to be classified as satellites; these hospitals feel that in making such arrangements they are taking orders, so to speak, from another hospital, although a major one, in the area. In addition, physicians may hesitate to take time from active patient care to work on tumor boards and tumor registries. Thirdly, many hospitals lack permanent staff with the result that the operation of the program would be left entirely to the attending physician or surgeon. A system of incentives may overcome these difficulties. Such incentives might include federal or state support for the establishment and operation of the registry and payment to physicians for overseeing its operation. In addition, continuing education for the hospital staff, detailing the benefits of the tumor board and tumor registry approach to the diagnosis and treatment of the cancer patient, should be encouraged and partially supported by state or federal funds.

Cytology: In the case of cervical cytology, the relatively large number of examinations that were performed reflects the acceptance of this test by the medical profession for use in both asymptomatic and symptomatic patients. However, when used as a screening device, many of the hospitals limit their efforts to outpatient clinic patients and still others to gynecological patients only. An intensive educational and demonstration program, involving the two universities and the State Health Department, is needed to encourage all hospitals to institute a policy which would require routine cervical smears on all adult female patients age 20 and over, whether inpatient, outpatient, or emergency patients. Since many of the patients will not be treated for gynecological conditions, it is proposed that no charge for this service be made and that the hospital be reimbursed for this service using state or federal funds.

The frequency with which bronchial cytology*, stomach cytology, and bone marrow studies are performed is much less than for cervical cytology since they are usually done only when indicated. However, it seems unlikely that the variation among hospitals in the number of admissions of cancer patients, where the site involved is one of these organs, can account for the variation in the number of times these tests are performed. A continuing education program for physicians stressing the indications for these tests could do much to minimize this variation.

Finally, much of the success of screening tests of this nature depends on the availability to the staff of competent cytotechnologists, and programs are needed to train such personnel. Present training programs in hospitals where such activities are on-going should be augmented. These training programs should also be supported by means of federal or state funds.

Radioisotope Scans: The use of radioisotope scans as a diagnostic technique for cancer is relatively new, and as a result qualified manpower in this area is in short supply. This need could be met through training programs in nuclear medicine for physicians which should be instituted by the two universities. In addition, technologists and technicians should be trained

* *The use of sputum cytology as a screening device was not investigated.*

and information disseminated to the hospitals as to where this training may be obtained. The Maryland Hospital Council should be encouraged to play a large part in the training of these allied health professionals. A recognized authority in nuclear medicine has suggested that radioisotope facilities should be located in each hospital for routine cases. For difficult cases, cooperative arrangements should be made with the university hospitals.

Chemotherapy: Considerably more information is needed concerning the type of chemotherapy programs in the hospitals since it is common knowledge that hospitals vary greatly with respect to the quality and quantity of these services. The Regional Medical Program could contribute to the increased efficiency in the use of chemotherapy by establishing a central registry which will contain specific information on the use of chemotherapy, by type of agent used, type of patient illness, and evaluating the chemotherapeutic treatment in terms of outcome. In fact, this information should be a part of the cancer patient registry, thus becoming a source of information to the physicians as to the effectiveness of the agents being used. This would increase the efficiency in the use of the various chemotherapeutic agents and probably improve the quality of care of cancer patients. A program of continuing education in the uses of chemotherapy could supplement this program.

Radiotherapy: The fact that only 16 of the 37 hospitals surveyed offer radiotherapeutic services to cancer patients does not necessarily mean that steps should be taken to make these services available in the remaining 21 hospitals. Rather, an intensive study is needed to indicate where such services would be justified. In those rural areas where it is determined that the installation of radiotherapeutic equipment is not justified, steps should be considered to make it easier for those patients who would have to travel or otherwise be away from their homes to receive such services. Many patients forego treatment because of the time it takes to travel to Baltimore or other central locations where this service is available, or because of the difficulties entailed in being separated from their families for extended periods of time. Thus, fast transportation such as a helicopter, or temporary low-cost housing should be investigated as possibilities for alleviating these difficulties.

The problem of the shortage of personnel with expertise in radiotherapy is an important one. To remedy this defect, the Maryland Regional Medical Program should sponsor training and continuing education programs for both physicians and radiotechnologists. Further, the Maryland Regional Medical Program should encourage cooperative arrangements among the major hospitals in the region and the smaller community hospitals to make consultative services available when needed. Finally, a program should be instituted whereby physicians report to a central registry the type and amount of radiotherapy given for each cancer patient treated. This information could then be analyzed and be made available to physicians as a guide in the further treatment of their patients.

Summary

1. A manpower and facilities survey of short-stay non-federal general hospitals in the Maryland region was conducted in March 1968. The data collected from 37 hospitals included information on diagnostic and therapeutic facilities for cancer.

2. Only 14 hospitals reported having a tumor board or tumor registry and 11 of these were located in the Baltimore metropolitan region.

3. Among the selected diagnostic procedures, cervical cytology was reported by more hospitals (35) and performed more frequently than any other procedure. At the other end, radioisotope scans were accomplished in only 20 hospitals.

4. In general, the median number of the selected diagnostic procedures performed increased with increase in hospital size. However, there was great variation in the number of procedures performed in each hospital size group.

5. Four of the five cobalt-60 teletherapy units in the Maryland region are located in Baltimore.

6. Complete diagnostic and therapeutic services for the cancer patient, including a tumor board and tumor registry are available in eight hospitals and only four of these have cobalt-60 teletherapy units.

7. Almost half of the hospitals in the region lack complete diagnostic facilities for cancer patients.

8. Methods suggested for improving the delivery of diagnostic and therapeutic services for the cancer patient include cooperative arrangements between hospitals for the diagnosis and treatment of patients, continuing education programs for physicians, and training programs for allied health professionals.

Expedient and accurate diagnosis has been the keystone of proper treatment in cases of carcinoma of the uterine cervix. Since, at present, "conization biopsy" is most often used to determine the extent of the many lesions, such a method for rapid evaluation of the excised cervical tissue, with the primary aim being the elimination of diagnostic delays, is of great importance.

The Cryostat Cone

J. DONALD WOODRUFF, MD
Professor
Department of Gynecology and Obstetrics
Johns Hopkins University School of Medicine

MICHAEL S. BAGGISH, MD
Clinical Fellow of the American Cancer Society

DANIEL B. KOOYMAN, MD

The authors would like to thank Mrs. Karen Leonard for her invaluable help in the preparation of this paper.

Prior to use of the cryostat, the standard procedure for studying cone biopsies included excision of the tissue with the patient under general anesthesia and a postconization hospital stay of 24 to 48 hours, for processing and evaluation of the material. If the pathological study revealed an operative lesion, definitive surgery was performed within 48 hours after conization, or delayed for four to six weeks (therapy in either case necessitating a second general anesthesia). The longer the period between conization and surgery, the higher the rate of morbidity. Using this standard approach, VillaSanta and Durkan [1] studied 200 "cold conization" cases and found a complication rate of 12%, including 20 postoperative hemorrhages, one pelvic abscess, one severe cystitis, and two "abortions". Seven of the patients who experienced severe bleeding required one or more units of blood.

Rutledge and Ibanez [2] reported 70 cases in which the cryostat sections were used to evaluate conization specimens. They reported excellent correlation between the results obtained from the frozen and permanent sections. In three cases, however, residual tumor was found in the removed uterus. This finding was attributed to inadequacy of the sample material rather than to inaccuracy in diagnosis of the frozen section.

Kaufman and co-workers [3] found that in 49 of their 52 cases, there was agreement in the diagnosis between frozen and permanent sections. The minor differences in degree of atypism did not alter the type of therapy given. The average hospital stay for those patients having the conized specimen sectioned on the cryostat and a hysterectomy performed if necessary, under the same anesthesia, was 7.8 days with a morbidity of 28%. Conversely, those patients who had conization followed approximately 48 hours later by hysterectomy, ie, two anesthetics, remained in the hospital 9.2 days and had an 86% morbidity rate. The average time from removal of the cone to the cryostat report was 20 to 40 minutes.

Dutra [4] reported 166 cases in which the conized tissue was studied by frozen section technique. Guerriero and his colleagues [5] recorded 150 cases and felt that the correlation of diagnosis between frozen and permanent sections was excellent. Greenberg and Kaufman,[6] Kaufman, Janes, and Cox [7] published a follow-up of their initial experiences of 1962. A total of 210 cases was studied. These authors concluded that the patients who had "frozen section cone" followed by hysterectomy under the same anesthesia had less morbidity than the group for which therapy was delayed 48 hours while awaiting permanent sections. They also found that the difference in diagnosis between the frozen and permanent sections in 14 cases was minor and did not alter treatment. Finally, any discrepancy in results obtained from the frozen section diagnosis and the cytologic study should delay

For Rapid Diagnosis

in Carcinoma of the Uterine Cervix

any treatment until permanent sections could be evaluated.

Study Material and Methods

The Gynecological Pathology Laboratory of The Johns Hopkins Hospital made a study between October 1965, and June 1967, and a total of 40 cervical cone specimens were sectioned on the cryostat. This study group was compared with a control group of 40 specimens evaluated by the standard procedure.

The usual criteria for performing conization were followed. The cytologic study in all cases prior to conization showed inconclusive and bizarre cellular changes of varying degrees of severity. Most cervices had had prior biopsy and colposcopy, neither study demonstrating any definitive evidence of invasive epidermoid carcinoma.

The usual preoperative study was carried out and preparation for conization was similar in both groups of patients. This study included history and physical exam, chest X-ray, electrolytes and serum urea nitrogen, and EKG (when indicated). The vagina was cleansed with an alcohol wash and, prior to surgery, the entire area was studied thoroughly with Schiller's or Lugol's solution. The pathology laboratory was notified 24 hours in advance of an impending cryostat cone.

The conization biopsy was performed following ligature of the descending branches of the uterine arteries. Great care, of course, was taken not to manipulate the portion of the cervix to be sent for evaluation. Following conization, dilatation of the cervix and curettage of the endometrium were performed. Sturmdorf-type sutures were placed, and routine preparation for either abdominal or vaginal procedure was carried out in anticipation of a possible hysterectomy.

Fig. I: Conized specimen. The suture marks "12 o'-clock; ie, the apex of the anterior aspect of the cervix, the point at which the canal is opened.

Each specimen was opened at "12 o'clock", wrapped in a saline-soaked sponge, and delivered to the Gynecological Pathology Laboratory by a special cable. The specimen was cut into four labeled sections as follows:

Section A	**12-3 o'clock**
Section B	**3-6 o'clock**
Section C	**6-9 o'clock**
Section D	**9-12 o'clock**

Fig. II: The three sections into which each quarter is usually divided: A—12-3 o'clock; B—3-6 o'clock; C—6-9 o'clock; D—9-12 o'clock.

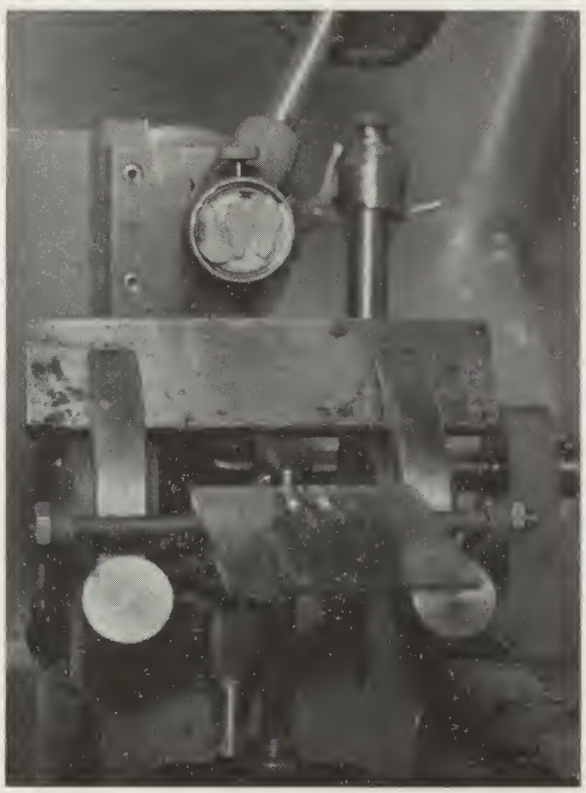

Fig. III: Sections from each quadrant, usually three, are (left) fixed on the holder, with "cyto-fix", frozen in the cryostat (often with the aid of the CO_2 spray), and situated so that the microtome blade attacks the long axis of the specimen; ie, perpendicular to the epithelial surface.

Each section was cut into two or three segments and placed on a cryostat stage, with the mucosal surface at right angles to the microtome blade. The stages were placed in the cryostat unit for quick freezing at —20°C to —30°C. Two to four sections (7 to 10 microns) were cut from each section and stained with hematoxylin and eosin. As the team, usually consisting of a technician and two others, carried out these procedures, the pathologist-in-charge read the sections. After complete evaluation, a telephone report was returned to the surgeon.

The entire procedure from surgery to report was accomplished in 20 to 30 minutes. All frozen sections were verified the following day by paraffin sections and in all cases the hysterectomy specimen was given similar close scrutiny.

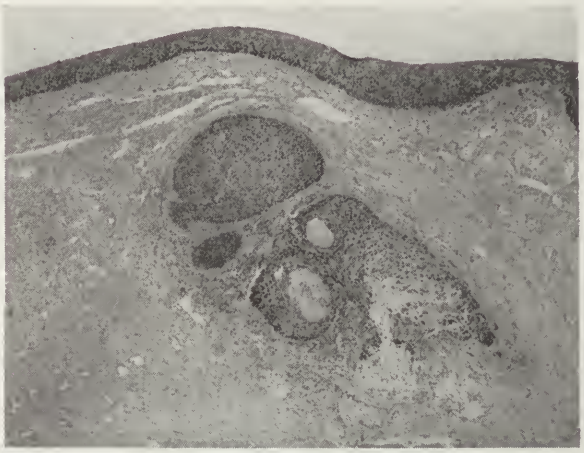

Fig. IV: Permanent section with surface carcinoma in-situ, gland involvement, and early stromal invasion.

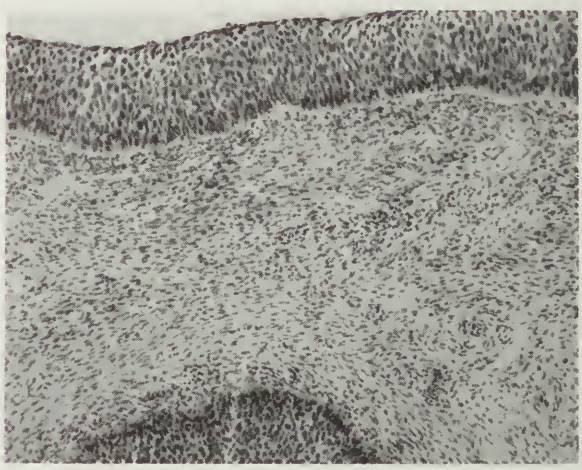

Fig. V: Cryostat section from same quadrant seen in Fig. IV.

Results

The results of this study showed considerable correlation in interpretation between permanent and frozen section specimens (Table 1). Where disagreement existed, such deviations were minor and in no case influenced the ultimate therapy.

The morbidity, as defined by a temperature elevation of 100.4° or above, 48 hours or more postoperative, was significantly less in the frozen section group than in the control group. The average hospital stay for those treated immediately after cryostat evaluation and subsequent surgery was 8.8 days as compared to 10.2 days in the control group (see Table 2). The number of patients requiring antibiotic therapy was greater in the control group as compared to the "cryostat study" patients.

The methods of treatment in the two groups are compared in Table 3. It is readily apparent that, in general, treatment was the same in both; however, a significantly increased number of vaginal hysterectomies were performed in the "cryostat study group," as compared to the abdominal approach in the control group.

In our small series, the diagnoses of frozen section material varied widely from cervicitis chronic to invasive epidermoid carcinoma. Three of the patients were also pregnant at the time of conization.

Discussion

From the accumulated data, it is obvious that the cryostat conization procedure has several advantages over the standard procedure. Hospital stay and the need for antibiotic treatment are decreased substantially. Since a quicker diagnosis can now be made, the physician can proceed with a diagnostic cone in cases of atypia, whereas in the past he may have performed a hysterectomy without this intervening procedure. In addition, with this method, only one anesthetic is needed, the possibility of further blood loss from the cervix in the interval between cone and hysterectomy is precluded, and the anxiety of the patient is alleviated greatly, knowing that if she does have carcinoma of the cervix immediate treatment will be given without further delay. Also, the physician must no longer schedule two operations, and postoperative morbidity is reduced since the physician operates through a clean wound rather than an infested area (after eight hours).

This study corroborates other reports and, on the basis of these results, the cryostat cone is now a routine procedure in selected cases at The Johns Hopkins Hospital.

Summary

Forty cases employing the cryostat section for rapid evaluation of the conization biopsy are presented. Compared to forty control cases studied in the routine manner in which the permanent sections are reviewed in 24 to 48 hours and the patient is subjected thereby to two anesthesias, the cryostat group had a lower morbidity and shorter hospitalization. Quality of sections and accuracy of diagnosis was equal in the two groups and compared favorably to several cited series. Several advantages, both theoretical and practical, have also been noted.

Any case of malignant neoplasia treated with drugs, radioactive agents, or surgery should be closely followed by the physicians who administered the treatment to the patient. However, due to the need for costly equipment and specialized personnel, more women with pelvic tumors are referred to and treated in fewer medical centers which are recognized for their superior ability in handling this disease. The distance of these centers from the patient's home and the patient's advanced age and consequent poor tolerance for traveling, often prevents her from receiving this ideal medical care. Therefore, she is often treated by her family physician, who is seldom prepared and more often unwilling to cope with the complications and sequelae of cancer treatment. The following presentation will attempt to synthesize the 40 years experience in the Gynecological Oncological Clinic at the University of Maryland School of Medicine.

UMBERTO VILLA SANTA, MD, FACOG
Associate Professor
Department of Obstetrics and Gynecology
University of Maryland School of Medicine

Post-Treatment Care of Patients With Pelvic Malignancy

Post-Treatment Visits

In an attempt to prevent recurrence of the disease, the visits following completion of treatment include a brief history of symptoms, a physical examination, and a pelvic examination. The patient is asked questions regarding her appetite, possible increase in abdominal size, possible presence of dysuria, polyuria, or hematuria, frequency of micturition, nausea or vomiting, diarrhea, painful defecation and the presence of bloody or tarry stools, abnormal vaginal discharges or bleeding, and abdominal pains or dyspareunia. The physical examination includes weighing the patient, taking her blood pressure, examining the supraclavicular, axillary, and inguinal lymph nodes and the breasts. The abdomen is then measured for its circumference, and palpations are made of the liver and spleen, and for masses or tenderness and the presence of dullness. The lower extremities are also examined, particularly for varicosities or edema. Inspection of the vulva and perineum, speculum visualization of the cervix and vagina, sounding of the uterine cavity (if present), and bimanual and rectovaginal examinations are included in the pelvic examination. Every six months, a Papanicolaou smear is taken.

Hemoglobin and hematocrit are measured every six months, and more often if required. Chest X-ray and intravenous pyelogram are repeated six months after treatment and at yearly intervals thereafter. Other

procedures include taking biopsies of different lesions when indicated, and performing proctoscopies, cystoscopies, and different diagnostic radiologic or chemical examinations if necessary.

After completion of treatment, the patient is asked to return to the clinic every month during the first year, every two months during the second year, and so on until a maximum interval of every six months is reached. Although an attempt was made to examine patients at yearly intervals, a large number of patients failed to return, and the patient-physician relationship was interrupted. However, patients are seen more frequently if their conditions require medical attention.

Recurrence of Pelvic Malignancies

Pelvic malignancy recurs more often in the first three years following treatment (Table 1), but late recurrence (after five years) represents 3% to 6% of all recurring cases. A breakdown of late recurrences (Table 2) shows that they sometimes occur even after an interval of 33 years.

Table 1: Interval Between Treatment and Recurrence

	Carcinoma of Cervix	Carcinoma of Ovary	Carcinoma of Vulva
0-12 months	62%	66%	48%
13-24 months	18%	18%	21%

If the recurrence is recognized early enough, it can be successfully treated, as demonstrated by Brunschwig,[1] Roddick,[2] and Rutledge.[3] There are now several patients in the University of Maryland clinic who have survived longer than five years after treatment of recurrence (Table 3). Because of the very large tumor dose delivered at the time of primary irradiation, the surrounding tissues have a poor tolerance for additional radiation therapy for treatment of recurrence. Therefore, only surgery can be satisfactorily employed for treatment of recurrent malignancies.

Table 3: Carcinoma of Cervix

Mean Survival After Recurrence

Form of Treatment	Number of Patients			Months
None	219			7
Irradiation	23			18+
Surgery	35	23 Dead	13	24.5+
		12 Alive	46+	

It must be remembered that there is the tendency for several organs of the "sexual skin"[4] to be affected by squamous cell carcinoma. Several such cases have been observed with multiple regional malignancies (Table 4), probably due to persistence of the same stimulus acting on similar stratified squamous epithelium. Whether this is due to recurrent disease, residual disease at the margin of resection, or to a multicentric origin of the tumor is still debatable. The concept of "cancerization" of normal tissue, first proposed by Brunschwig and Tschetter[5] for carcinoma of the skin, has been reintroduced by Woodruff and Williams[6] for lesions of the cervix, vulva, and vagina. Also in cases such as these, prompt treatment of the second or third malignancy can be highly successful.

Any patient with one malignancy has a tendency to develop a second one in an unrelated organ, as shown in Table 5. In the University of Maryland clinic, approximately 5% (49) of the 1,000 patients whose cases were followed for five years or longer developed second and third malignancies. A similar incidence was reported by Day,[7] Moertel, Dockerty, and Baggenstoss,[8] Julian and Woodruff,[9] and Ostergard and Morton.[10] This figure is 20 times higher than for the normal population (50 per 100,000 annual cases).[11]

Diagnosis and Treatment of Complications

Another reason for frequent examinations is the diagnosis and treatment of complications that frequently occur following therapy. Table 6 shows the most common complications occurring after radiotherapy for carcinoma of the cervix. It is evident that with the employment of the newer machines capable of delivering a higher and more lethal dose to the tumor, even the normal tissues suffer additional injury. One of the most common and tedious complications of irradiation is certainly the cervical-vaginal necrosis, which occurs most often six to nine months after therapy. It is characterized by vaginal discharges, often bloody, and pelvic pains or dyspareunia. This condition is very difficult to treat since there is no specific drug that can be prescribed. The necrosis requires six months to a year to heal, if it heals at all. But more often it develops into parametritis or pelvic cellulitis and frequently progresses to rectovaginal or vesicovaginal fistula. Drugs such as synthetic estrogen, thyroid extract, cortisone, etc. have been prescribed, but with no definite success. The most frequently used methods of combating the infection are local or systemic antibiotics, antiseptic douches, and, with best results, complete bed rest in the hospital. The necrosis will often produce massive hemorrhage which may become so severe that it causes the death of the patient despite attempted surgical procedures (ligation of uterine or hypogastric arteries, exenteration, etc.) and blood replacement.

Proctitis is also frequent, and usually occurs six to twelve months after irradiation. Common symptoms

Table 6: Carcinoma of Cervix Complications

	1945-55	1956-62
Hemorrhagic cystitis	9	22
Vesico-vaginal fistula	...	3

Intestinal obstruction	1	2
Thrombophlebitis	3	...
Hemorrhage requiring transfusion	...	9
Total Complications	50	150
Total Patients Treated	271	232

are tenesmus, pain, and rectal bleeding. This condition often progresses to severe rectal stenosis and requires colostomy. The most effective treatment is a low residue diet and the use of cortisone, either in the form of suppositories or injection. Proctitis sometimes progresses to rectovaginal fistula. Attempted surgery to correct this condition is seldom successful, due to the poor vascularization of the surrounding tissues, and these patients will also require a colostomy.

Another common complication is hemorrhagic cystitis, which can produce enough intravesical clots to prevent micturition. Other symptoms of this condition are hematuria, tenesmus, frequent micturition, and nocturia. Antibiotics and antispasmodics are successful in treating the milder cases, while the more severe cases require intravesical instillation of mild caustics, such as 30 cc of 0.5% $AgNo_3$ for five-minute intervals. Urinary diversion is performed only as a last resort. Most cases of hemorrhagic cystitis occur two years after treatment, but it can occur at almost any time. Sometimes it may lead to vesicovaginal fistula.

Periureteral fibrosis, causing stricture of the pelvic ureter with consequent hydronephrosis and poorly functioning kidney, is a complication not recognized until recently.[12] As a matter of fact, the presence of a non-functioning kidney in a patient with pelvic malignancy, with normal urinary function prior to treatment, was always regarded as factual evidence of recurrent carcinoma. However, in 1934 Bugbee [13] had found no cancer in four of eight patients with ureteral obstruction following radium implantation into the cervix; similar findings were confirmed by Howes and Strauss [14] in autopsies of irradiated patients who died of hydronephrosis or pyelonephritis. Ten cases of periureteral fibrosis have been observed at different times, most of them between 21 to 30 months following treatment. If the stricture is discovered promptly, the kidney can be salvaged by a diversion. Reimplantation of the ureters in the bladder is not feasible, because of the poor vascularity of the pelvic tissues

and the wide space to fill. Ureteral dilatation has not been attempted.

Intestinal obstruction due to postoperative adhesions, radiation peritonitis, or metastatic mesenteric malignancy is also frequently observed in these patients. Should medical management such as suction and parenteral feeding fail to relieve the obstruction, surgical exploration and resection or colostomy are mandatory. Intestinal obstruction and various forms of urinary and fecal fistulas often follow radical surgery and may require several surgical corrections.

Psychological Management of the Patient

Another important facet to consider is the psychological management of pelvic malignancy patients. First of all, should the patient be told that she has a malignancy? Experience has shown that the great majority of patients will accept the facts as a relief from fear and doubt. Most patients already suspect the truth. But the seriousness of the disease should be underplayed. The doctor should always be optimistic: "Almost 20% of the patients recover," rather than "Over 80% will die". The necessity of life-long follow-up programs from the beginning of treatment should be stressed, and the patient will usually accept this. The follow-up examination should be made as pleasant and painless as possible, so that the patient will not dread her next appointment. Every step of the examination should be explained in order to reduce additional fear. The five-year follow-up program in this clinic contained 95.4% of the original patients, most of them from the lowest socioeconomic classes. This is valid proof that even better results can and should be achieved in private practice.

A common observation is that if the patient has someone to talk to her or call her if she misses an appointment, etc., she will more readily respond to any diagnostic and therapeutic measure designed to cure her disease. The busy practitioner should allow sufficient time for adequate examination of cancer patients. Perhaps he should schedule one session a week or month, according to the number of patients he is treating, solely for the examination and treatment of this group of patients. Often a patient will receive beneficial group psychotherapy in the waiting room.

Such patients should be advised to return to normal life and possibly to their previous occupation as soon as possible, even if on a part-time basis. Sexual activity should be resumed after surgical incisions have healed (usually six to eight weeks) and one to two weeks after internal radium therapy. After surgical or actinic castration, substitutional therapy should be given in the form of synthetic estrogen to prevent menopausal symptoms, dyspareunia, osteoporosis, and cardiovascular changes. The diet should be adjusted to the patient's need. Iron and vitamin additives stimulate the appetite and speed up the postoperative recovery: they should also be prescribed. Certainly a physically and emotionally well-adjusted patient is a worthy reward for the physician's effort.

Medicare and Nursing Homes:

The Changing Scene

LEON BERNSTEIN, DrPH
Senior Social Science Research Analyst
Office of Research and Statistics
Social Security Administration, DHEW

I will discuss some current issues concerning medical care which have special relevance to the Medicare program and particular interest for professionals who are active in the skilled nursing home field. What I propose to do is to review some of the more pressing problem areas affecting medical care of the aged, especially medical care in long-term facilities. A heightened awareness of these problems and the resolution to do something about them characterize the changing scene which is accompanying a new and vigorous administrative thrust toward improving and tightening up the administration of the Medicare program.

The Cost of Medical Care Services

Medical care costs and medical care prices are among the most pervasive problems on the current medical care scene. They are by no means confined to the services which aged persons receive. While care of the aged in nursing homes, hospitals, and physicians' offices has received much recent publicity, attention must be paid to the total costs, the prices, and the expenditure problems for the entire population. Since the medical care dollar is not a limitless resource, we will have to consider very carefully how we order massive expenditures for health care and how we allocate the money, manpower, and facilities which make this care a reality.

Certainly the growing problem of medical care costs and prices suggests that some decisions will have to be faced, and soon. There is little doubt that the Medicare system is not entirely within our control. It might be a good idea to look at a few facts and to examine a few apparent trends which will form the basis for future decisions. A brief examination of hospital and physicians' charges shows:

(1) Daily service charges for hospitals have increased faster than any other component of the medical care price index. From 1946 to 1960, daily service charges increased at an annual rate of 8.3%; from 1960 to 1965, the rate was 6.3%; but in 1967—a single year, the rate increased to 19.1%, although in 1968 it dropped to a not inconsiderable 13.2%.

(2) The demand for higher wages is the major factor in the rising price of institutional care. While wages have been low, the considerable gains which have been achieved recently have not necessarily resulted in higher labor productivity. Unfortunately, machines are simply incapable of providing medical care, especially therapeutic care. The need for the human component in the medical care system is quite unlike the situation which prevails in the typical American industrial organization.

(3) Though physicians are the major focus of the increasing demand for medical care services which has developed out of improved insurance coverage, public programs such as Medicare and Medicaid, and a growing awareness of the value of medical care, the supply of physicians has not kept pace with the demand. Nor have the methods of providing or delivering care greatly relieved the present situation. In plain economic terms, increase in demand usually results in increased prices for the services required. Physicians' services, which have not increased sufficiently, are no exception.

A brief examination of some significant trends in medical care expenditures may be useful at this point.

(1) The institutional resources in this country include some 20,000 long-term care facilities. These facilities contain approximately 900,000 beds. About one half of the patients in nursing homes receive their care through payments from public agencies under the Medicare and Medicaid programs. For fiscal 1968, federal, state, and local funding agencies spent almost $1 billion for nursing-home care under the

Presented at the Annual Meeting of the American Association of Nursing Home Physicians; Shoreham Hotel, Washington, D.C., August 24, 1969.

Medicaid program. This amounted to 30% of all the expenditures made for medical assistance during that period. In addition, Medicare paid out $330 million to extended-care facilities.

(2) The average extended-care facility claim has risen sharply since the ECF program began under Medicare. During its first year, 1967, the average claim was $306. However, the average for all ECF claims, through October 1968, was $368.

(3) Medicare expenditures amounted to $3.4 billion in fiscal 1967. They are expected to reach $6.8 billion by fiscal 1970. Medicare hospital insurance expenditures alone—which include extended-care facility billings—will reach over $5 billion by that year, and medical insurance expenditures (the Part B of the Medicare program) will make up the balance. From July 1966, when Medicare began, until October 1968, the Social Security Administration paid out $6.85 billion against some 15 million Medicare claims.

(4) During fiscal 1968, $53.1 billion was spent on health care in this country. Medicare's share was $5.3 billion, about 10% of that total figure. Total public expenditures amounted to $19.4 billion, and Medicare's contribution exceeded one fourth of that total. Some interesting shifts in sources of payments have occurred. For example, in the year preceding Medicare, about 69% of the payments for personal health care of the aged came from private sources. In the first year of Medicare, fiscal 1967, the private sector's share dropped to 41%. In that same year, over one third of the financing of medical care for the aged which came from public sources was paid by Medicare.

(5) Hospital expenditures reflect similar shifts in source of expenditures. Per capita hospital care expenditures for the aged during fiscal 1966 came to $182. Of this figure, $93 was supplied from the private purse. In the following year, fiscal 1967, the aged person's hospital bill rose to $222, but only $18 came from the private purse. Fully three fifths of the public share of $204 came from Medicare.

(6) Per capita private expenditures for physicians' services to aged persons amounted to $66 in 1966, the year before Medicare. In 1967, that figure dropped to $46 at the same time that the public's share rose from $5 in 1966 to $39 per capita in 1967. Included in those figures are the $3 monthly premiums that were paid by, or in behalf of the aged person. Altogether, Medicare paid $626 million to physicians for services to aged persons during Medicare's first full year. This amounted to 39% of the total bill for physicians' services to the aged of $1.6 billion for the year.

So much for illustrative data. The above statistics have been used to underline some of the sources of growing public concern over the costs of medical care. The changing scene suggests that the Administration is responding to this concern. The efficient, economical operation of health related programs is one form of response, but in addition, the Administration has taken specific steps to moderate the rising costs of health care. It was felt that cost finding in institutional settings had become much more precise than it had been in the beginning. Reasonable costs for institutional care have become more familiar entities, in other words, and any "extra" amounts to cover "unknown" items seem to be no longer necessary. Accordingly, the decision was made to eliminate the 2% extra payment in addition to audited costs to not-for-profit facilities and 1½% payment to proprietary establishments under Medicaid and Medicare. The American Hospital Association has reported growth in hospital income under Medicare, and certainly private investment has become increasingly attracted to the nursing home field. The changing scene suggests that the "cushion" which was built into the 2% and the 1½% extra should be replaced by the development of more efficient ways of meeting costs, and in fact, reducing costs, without affecting the quality of care.

Vital Statistics on Aging Americans

I would like to turn now to numbers with a different significance than the figures we have just reviewed. I am referring to some rather familiar statistics which describe our 20 million older Americans, numbers which yield the facts of life and death about our aging population. Somehow, the meaning of these numbers escapes us from time to time and we fail on occasion to draw appropriate implications from them.

Older Americans represent not only a growing number but a growing force which is changing the distribution of the nation's health care resources necessary to meet its demands and their attendant costs. A changing scene shows that very soon we will have to decide, in some coordinated way, just how we propose to deal more effectively with the complex demands of this group, how we will allocate our stock of resources, order expenditures, and structure services.

A brief review of the statistics may place the problem in focus.

(1) Although at the present time about one person in ten in this country is 65 years of age or older, the characteristics of these 20 million people and the implications for the future are not clearly understood. Within five years, for

example, there will be a net increase of 1½ million older persons, but one third of this number will be complete newcomers to the group—with different and changing cultural, social, and economic backgrounds and rather different needs and demands. By 1990, it is anticipated that the total will reach 27 million —a larger, somewhat different population than we have today.

(2) Of the 20 million older persons, 37% are 75 years of age or older. There are more than one million people who are 85 years of age or older. In addition, for every 134 older women there are 100 older men, and life expectancy continues to increase faster for females than for males. Among the elderly, there are four times as many widows as widowers.

(3) Only 48% of the elderly live in family groups in which both husband and wife are still present. While only 5% are living in institutions, a full 25% live alone or with nonrelatives. Some experts feel that the increasing trend toward living outside the family group presages further needs by the aged for eventual institutional living with related changes in the structure of their medical care services.

(4) As an older population increases at a rapid rate (50.1% from 1960 to 1985) the prevalence of chronic illness will grow even more rapidly as the population ages. It is estimated that by 1985, there will be 6½ million more people with chronic illness than there were in 1960.

These are impressive figures. Nursing homes and the duties of their staffs are going to be affected by the pressure of these statistics and their very special impact on the health care system. Obviously, we cannot reduce the aged population, so we will have to decide how to deal with it more effectively, how to minimize some of the deteriorating effects of growing old, and how to begin to balance the nation's resources against the needs of the aged and other population groups as well.

More Nursing Homes and Nursing-Home Beds

The recent increase in the building of nursing and related care homes is one obvious response to the increased demand for medical care services. Federal legislation, and particularly legislation affecting reimbursement, has provided the major impetus. The obvious result has been more beds, more health care personnel and, in general, more quality service in nursing care and related homes. This growth pattern presents a number of questions. How many more nursing home beds do we really need? Can we afford all of them? And of what type should they be? Will the present form of nursing-home care and organization continue to meet the needs of the elderly? Are we giving sufficient attention to institutionally based centers for ambulatory and outpatient services? What can we anticipate regarding the impact of rapidly expanding corporate involvement in nursing home organization, particularly on costs?

At this point, we might review very briefly some basic nursing home statistics which will help us understand patterns of growth and change. We have had some reasonably useful nursing home statistics since 1939, when the Census Bureau reported some 1,200 nursing care, convalescent, and rest homes in this country with a total of 25,000 beds. By 1954, those figures had changed, in a Public Health Service count, to 25,000 homes and 450,000 beds. In 1967, a somewhat more discriminating counting process reported 20,000 nursing and personal care establishments. At any rate, from 1963 to 1967, the number of beds in nursing care and related homes increased by about 50%, from a total of 568,000 to 846,000. Sixty-nine percent of the 1967 total were nursing care beds, pretty much as we would define them today. While I do not have currently updated figures at hand, the process of adding more beds (and filling them) goes on.

But the real question is whether or not, despite this growth, we have a sufficient supply of nursing home beds. I don't think we really know, though we do have some doubts about their distribution, and within the Medicare program, at least, whether or not we are using extended-care facility beds effectively. The following figures should illustrate this point. As of July 1968, some 4,700 extended-care facilities were participating in the Medicare program. They contained a total of 330,000 beds. In that year, 13% more *facilities* were added to the program, with 54% of the increase occurring in the Pacific, East North Central, and Middle Atlantic regions alone. Extended-care facility *beds* increased by 13% also, about 38,000 beds. One quarter of the increase occurred in the Pacific states, while the Middle Atlantic and East North Central states claimed 31% of the total. On the other hand, despite a gain over 1967, the change in East South Central states was only from 9.5 extended-care facility beds for every 1,000 Medicare beneficiaries to 11.8/1,000 in 1968. The national distribution rate reached 17.2/1,000 by July 1968. In comparison, New England states reported 20.1 beds/1,000, the West South Central region 25.4/1,000, and the Mountain states reported 33.9 beds.

Do these figures suggest some inequity of distribution? Mr. Arthur E. Hess, Deputy Commissioner of the Social Security Administration, in a recent presentation before a meeting of nursing home principals, indicated that we were probably overbuilt in some areas but that there was a long way to go before we could report accessible services in all the remote communities, and in some growing population centers

of the country. The changing scene suggests a much more thorough examination of the distribution and utilization of nursing home facilities under the Medicare program.

Administrative Problems

We should anticipate some new and definitive approaches to a number of administrative problems related to extended-care facilities under the Medicare program. These problems are rather clearly delineated and their resolution is certainly part of the changing scene. First, the ever-present problem of utilization review is still a weak point in the program. Second, concern over levels of care which patients are receiving in ECF's continues, but there is increasingly effective determination of this issue. Actually, the question is whether or not that level of care is covered under Medicare's ECF benefits. And third, problems have arisen with some institutions where ancillary services under arrangements with outside organizations may be exceeding reasonable costs.

A good deal of the present difficulty may be due to an apparent misunderstanding over the basic provisions of the Medicare law which provides for ECF care as an extension of hospital care, on a short-term basis and with skilled nursing care emphasis. Utilization committee experience is under careful review now, not only within ECF's but among hospitals as well. More careful decisions regarding the necessity for extended care, while the patient is still in the hospital, will simplify medical care coverage questions when the patient is admitted to the ECF. ECF utilization review practices are also under study. It would seem advisable for extended-care facilities to carry out utilization review more frequently in order to avoid possible denials of Medicare claims. Sample review of professional and administrative practice within extended-care facilities requires greater encouragement as well, for it is from the recorded experience of the care of the patient that medical directors of institutions and program administrators alike can determine what improvements may be necessary.

Incentive Reimbursement Experiments

Late in 1967, the amendments to the Social Security Act included a provision authorizing the Secretary of the Department of Health, Education and Welfare to experiment with various methods of reimbursement. The purpose of this experimentation was to create new incentives to provide efficient and economical medical care services. Congress clearly intended that the Department should turn to nongovernmental agencies and institutions for experimental innovations in the reimbursement process and an examination of the history and discussions concerning this provision certainly supports this recommendation. To date, the nongovernmental sector has not been overly responsive so that relatively few useful proposals have been submitted to the Department despite a very considerable effort to attract proposals from hospital and nursing home groups. As costs continue to rise and as public concern over the phenomenon continues to grow, the need for innovative approaches is more apparent than ever. The absence of a substantial number of proposals raises some interesting questions. Can't the traditional method of reimbursing for hospital and nursing home costs yield any improvements in efficiency or economy of operation? Will it be necessary, through the legislative process, to select some alternative methods of payment? The Administration wants to exploit the possibilities of an incentive approach to minimizing hospital and nursing home costs to the fullest, and incentive reimbursement is a lively issue at the present time. The medical care institutions are urged to join in efforts to consider experimentation proposals.

Conclusion

The Administration is keenly aware of the real dimensions of the changing scene in health care in this country. It has underscored the urgent need for concerted action by government and the private sector in dealing with the problems in health services delivery and their vital connective systems. The Secretary noted very recently that we tend to be overusing high-cost, acute-care facilities while the increasing need is for lower-cost alternatives. Certainly the role of the skilled nursing home as one of those lower-cost alternatives has yet to be fully realized. Is it continuing to be, as Congress intended, and as the nation's health care system really requires, an extended-care facility, or is it something else? If nursing homes can be extended-care facilities, to what extent are their admissions limited to the elderly Medicare or Medicaid beneficiaries? To what extent are younger hospital patients being admitted to nursing homes for post-hospital, post-acute, moderate cost institutional care? These are only a few questions of immediate interest for the physician in a nursing home or a chronic disease facility.

The primary concern is for the efficient administration of a comprehensive series of legislatively authorized medical services for the aged. Problems of administrative management are increasingly problems of cost management and cost containment. Seen in this way, it should be clear that decisions about program costs must be made continuously. No one seems to question the general need for medical care services, but within the framework of the law and our stock of resources, there are serious questions about how we shall afford them.

The solutions to the problems which this discussion has posed will take many forms. Because health care services are changing now, and are likely to change their traditional character even more tomorrow, we can't really predict what forms they will take, but the likelihood is that these changes will evolve out of experience, experimentation, and out of needs and demands which are also changing.

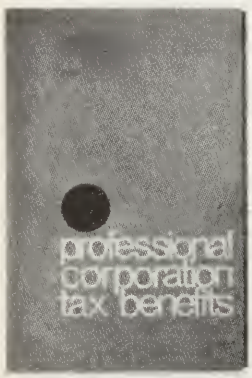
your medical faculty at work

by John Sargeant
Executive Secretary

The Executive Committee met on February 12, 1970, and took the following actions:

1. Approved the proposed revised State Department of Health and Mental Hygiene Radiation Control regulations;
2. Adopted the Special House of Delegates minutes for December 13, 1969;
3. Approved the annual $100 contribution to the Student American Medical Association;
4. Agreed to recommend to the Council that the three-year contract of the Executive Secretary be renewed for a similar term and under the same conditions as previously. This is in accordance with Article VII, Section 5 of the Faculty Bylaws;
5. Appointed the Executive Secretary and Watson P. Kime, MD, as Delegate and Alternate to a "working group" of the State Comprehensive Health Planning Agency;
6. Declined to participate in a proposal to develop a uniform hospital abstract discharge summary, inasmuch as there are other means to accomplish the same objectives which should be explored first;
7. Designated nominees for the Board of Physical Therapy Examiners for appointment by the Governor;
8. Agreed to attempt to set up within the law a provision for a Medical Advisory Group in the legislation establishing a new Department of Transportation within State Government;
9. Declined to release data to a physician from Mediation Committee files because it is Faculty policy not to release data of any kind from its files;
10. Discussed with the Journal Editor the financial status of the Journal and adopted various recommendations to be made to the Council;
11. Agreed to join as Amicus Curiae in connection with a trial in the Court of Appeals dealing with a patient's right to reveal information as to his condition to a physician and to have this information used to convict him in court;
12. Heard briefly about the "arbitration panel" to arbitrate malpractice actions which is currently being considered in the Medical Economics Committee; and also heard that legal counsel had requested the Court to establish a Rule of Procedure that would require posting of a $500.00 bond to cover costs in any malpractice actions filed with the Court;
13. Rereferred to the Council proposals of Prince George's County Medical Society that would (a) provide for trial by judge or jury at option of defendant in Tort cases, and (b) attempt to outlaw the "contingent" fee in legal fees;
14. Referred to the Policy and Planning Committee the AMA proposals on long-range planning with a request that a report be made to the Council prior to the June 1970, AMA House of Delegates session.

— o —



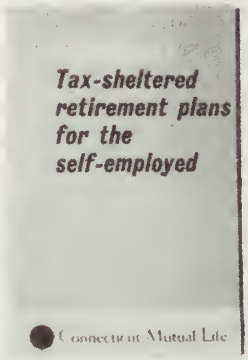
The Executive Committee met jointly with the Hospital Council Executive Committee later the same day to discuss:

1. The proposed arbitration panel for malpractice actions;
2. Verification by hospitals of house staff physicians' credentials and possible illegal use of unlicensed physicians in hospitals outside of training programs;
3. Legislation currently pending and proposed for the future in the General Assembly at Annapolis.

Should You Incorporate?

Maybe Yes.

The present I.R.S. position boils down to this: When you become an employee of your own professional corporation or association, a lot of good things can happen. For one thing, you may cut your income tax. For another, you can beef up your retirement investments with more tax-sheltered dollars.



After reading our booklet, "Professional Corporation Tax Benefits," you may well decide to explore the matter further with your attorney or tax accountant.

Maybe No.

There could be several reasons why the idea of incorporation doesn't fit your current picture. If so, all the more reason for you not to miss out on Keogh Plan advantages.

This plan gives you several tax benefits. Like tax-deductible contributions. And tax-sheltered accumulations of your retirement nest-egg. The full story is waiting for you in our booklet "Good News."

Send now for a copy of either informative booklet. Explore these opportunities for saving money. But remember, you won't get the tax benefits unless you do *something*. The coupon below is your first step.

Connecticut Mutual Life Insurance Co.

A Service of the Tuberculosis Association of Maryland

tuberculosis

Tuberculous Peritonitis

Percutaneous biopsy of the peritoneum was a simple and quick method of diagnosing tuberculous peritonitis in 47 patients. The condition was successfully treated with antituberculosis drugs. Addition of a steroid improved long-term results.

Forty-seven patients with tuberculous peritonitis were followed for periods ranging from two to almost six years. The purpose was to ascertain how frequently such patients have tuberculous foci in the lung, intestine, or fallopian tube.

It was also intended to test the usefulness of histologic techniques for the diagnosis of peritoneal tuberculosis, and to find out whether the involvement of other serous membranes such as the pleura and pericardium occurred often in tuberculous peritonitis. Effectiveness of antituberculosis drugs and the role of adrenocorticosteroids in the treatment of this condition were also evaluated.

Of the 47 patients, 20 were men and 27 were women. All had been admitted to a medical ward of the Irwin Hospital in New Delhi, India, between 1963 and 1966.

In each case, diagnosis was based on the finding of a caseating granuloma in a biopsy specimen of the peritoneum. Other studies included X-ray examination of the chest, tuberculin skin tests, and, in the case of the women, salpingograms.

All patients had fever and ascites. Other clinical manifestations included abdominal pain, often only vaguely described and vaguely localized, night sweats, anorexia, and weight loss. Before admission, symptoms had been present from two weeks to seven months. The average was three months. Total white-cell count in the peripheral blood was within normal range in 86% of the patients and mildly elevated in the remaining 14%. Hemoglobin values were between 10.0 gm and 13.0 gm per 100 ml.

None of the patients had ascitic fluid protein content below 3.0 gm per 100 ml. The highest value was 7.5 gm per 100 ml. Pleocytosis in ascitic fluid ranged between 150 and 2800 leukocytes per cubic millimeter. Lymphocytes accounted for 75% to 96% of the total cell count. The tuberculin test was positive to first strength PPD in all cases.

Lung Focus Rare

Only three of the patients showed a focus of infection in the lung on X-ray film. Barium studies to detect intestinal tuberculosis showed increased intestinal motility and dilatation of segments of small bowel in 24 (51%) patients, but in no patient was an intrinsic intestinal lesion detected. Intravenous pyelography did not reveal renal abnormality in any of the patients, and salpingography in the women gave no evidence of a lesion in the fallopian tubes. On direct smear examination of ascitic fluid, acid-fast bacilli were found only once. Cultures, however, were positive in 39 cases.

Because of the time necessary to culture the bacilli, an evaluation of various techniques for histologic diagnosis was made.

Biopsy Procedure

Percutaneous liver biopsy was not found to be helpful. Percutaneous biopsy of the peritoneum, with the use of an Abrams needle first and a Cope needle later in the study, was tried in all 47 patients. A caseating granuloma in the biopsy specimen was demonstrated in 30 (64%) of the patients. In the remaining 17 patients, peritoneoscopy was carried out. With the addition of this procedure, the success of histologic diagnosis rose to 85%. In the remain-

MADAN M. SINGH, MD; AMAR N. BRARGAVE, MD; and KRANTI P. JAIN, MD. *The New England Journal of Medicine,* November 13, 1969 (Vol. 281, No. 20).

ing seven patients, laparotomy was necessary to obtain histologic diagnosis. At laparotomy, the peritoneum was found to be studded with tubercles. There was thick exudate, and loops of bowel were often badly matted together.

On X-ray examination, 15 patients were found to have pleural effusion in small amounts. A diagnosis of "cryptic pericarditis" was made in six patients on the basis of electrocardiographic findings even though none had chest pain, pericardial friction rub, or radiologically enlarged hearts.

Antituberculosis drugs were administered to all patients. Streptomycin and isoniazid were first given. After three months, PAS was substituted for streptomycin. In all, the antituberculosis drugs were given for 18 months. Alternate patients also received prednisone, which was gradually tapered off during the fourth month and discontinued at the end of that month.

The antituberculosis therapy was highly effective. No deaths occurred in the patients treated. However, intestinal obstruction developed a year and a half or more later in three of the 24 patients who did not receive the steroid, and surgery was necessary. This complication was not seen in the patients who had steroids.

One of three patients with "cryptic" pericarditis who did not receive the steroid had frank manifestation of constrictive pericarditis and had to undergo surgery two and a half years later. None of three patients in the steroid-treated "cryptic" group had constrictive pericarditis. Thus, in four of the 24 patients treated without steroids, late fibrotic complications of tuberculosis developed.

The study shows that parenchymal pulmonary foci are uncommon in patients with tuberculous peritonitis, the rate in this series being only 6%. It therefore seems unreasonable to attribute tuberculous peritonitis to a hematogenous spread from a concomitant pulmonary focus in the vast majority of such patients.

Latent Tuberculous Focus?

The evidence strongly favors the hypothesis of C. M. Nice, Jr., that tuberculous peritonitis is due to the activation of a long latent tuberculous focus in the peritoneum, perhaps established years previously as a result of hematogenous spread from a primary focus in the lung. Healing of the pulmonary focus was so complete that no X-ray evidence of a lung lesion was apparent.

In the present series, percutaneous biopsy of the peritoneum was a useful method of arriving at a quick diagnosis. The success rate was high. However, the possibility of bleeding and bowel perforation must be kept in mind, and the biopsy should be performed only on patients with ascites. Patients should be followed closely for 48 hours after the procedure. If a patient's condition becomes worse, a diagnostic paracentesis must be performed rapidly to ascertain whether complications have developed.

The fact that no deaths occurred in the present series shows how effective antituberculosis drugs are in treating the condition. The study also points to the desirability of adding steroids to the antituberculosis drug regimen in treating tuberculous peritonitis.

Local Diagnostic and Advisory Service For Handicapped Children

Special multi-professional diagnostic services for handicapped children currently exist in 13 of Maryland's health departments.* A community program initiated in 1963—the Diagnostic and Advisory Service—was established to supplement rather than to supplant any of the already existing public and private health services. In so doing, it fulfilled a great local and state-wide need for a comprehensive diagnostic resource to evaluate multiple handicapped children and their families.

An outgrowth of the Diagnostic and Evaluation Centers for handicapped children at Johns Hopkins and University of Maryland hospitals—the Diagnostic and Advisory Service—bridges the gap in distance and communication between the metropolitan diagnostic centers and local communities where patient management actually occurs. At the present time, the Diagnostic and Advisory Service consists of two full-time and one part-time traveling team of professionals, a pediatrician, psychologist, state and local public health nurses, and social worker in some counties. Frequency of clinic visits varies from as often as twice a month in some counties, to twice a year in others.

The clinic day's work involves evaluation of only two children. However, the team typically renders a service to the whole family in which the exceptional child is the focal member. Time is allowed for careful clinical evaluations, parent counseling, and staff conferences. A conference arranged at the end of each clinic session permits team members, local health department staff, and especially other vital professionals including private physicians, educators, and social workers to confer and formulate realistic plans for handicapped children. Local specialty clinics and private physicians provide additional consultative or management services when needed. The philosophy of the service places the overall responsibility for long-term management on the community.

Children known or suspected of having one or more handicaps are considered eligible for referral to the Diagnostic and Advisory Service. Those cases referred are further screened by the team. Eligibility for service is based mainly on the type of problem rather than indigency or family income. Priority is, furthermore, given to young children of preschool age in the interest of early identification and prevention of secondary handicaps. Sources of referral to the Diagnostic and Advisory Service have typically been public health nurses, specialty clinics, private physicians, local departments of education, and social services. About two thirds of the children seen are intellectually handicapped or mentally retarded to varying degrees. The mobile team also serves as diagnostic resource in counties where day care centers for the mentally retarded also exist. In addition to known or suspected mental retardation or other types of delayed development, examples of other appropriate referrals would include children with suspected cerebral palsy, multiple physical handicaps such as cleft lip and palate, neurological dysfunction, perceptual problems, and other learning disabilities. The team is neither designed nor equipped to deal effectively with known or outright psychiatric dis-

* *Allegany, Calvert, Caroline, Cecil, Charles, Frederick, Garrett, Harford, Queen Anne's, Somerset, Talbot, Wicomico, and Worcester counties.*

orders, juvenile offenders, or previously diagnosed children in need of direct treatment services.

The teams have now evaluated over 800 children with multiple handicaps, re-evaluated over 250 of these at least once, and followed the progress of countless other children by consultation. While so doing, the traveling clinics have attempted to demonstrate a holistic team approach to handicapped and retarded children emphasizing quality, coordination, and continuity of care. A continuing but unfulfilled objective of the Diagnostic and Advisory Service remains one of developing locally operated and staffed multi-diagnostic services for handicapped children in regions where interested, adequately qualified manpower is potentially available.

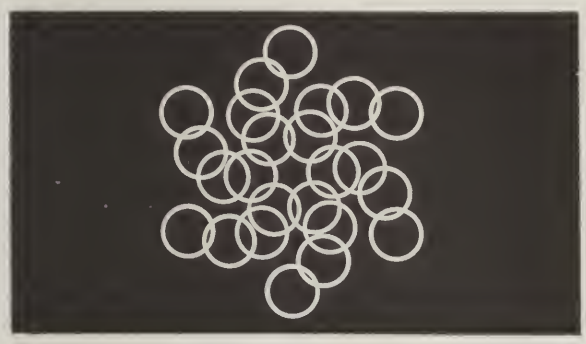
Employee-Patient Ratios

The ratio of employees to patients in Maryland's four regional psychiatric hospitals (Crownsville, Eastern Shore, Springfield, and Spring Grove) has more than doubled since 1950. The following table shows that this change has been caused mainly by an increase in the number of employees. The average size of the patient population in these hospitals, which increased until 1955, has since declined below the 1950 level.

FISCAL YEAR	AUTHORIZED POSITIONS	AVERAGE SIZE OF PATIENT POPULATION	AUTHORIZED EMPLOYEES PER 100 PATIENTS
1950	1,719	7,844	21.9
1960	3,225	8,516	37.9
1964	3,553	7,821	45.4
1968	4,188	7,435	56.3
1969	4,222	7,161	59.0

This rising employee-patient ratio relates primarily to a continuing change in the patient population's composition resulting from a sevenfold increase in admissions (from 1,953 in 1950 to 13,567 in 1969) and a tenfold increase in live releases (from 1,233 in 1950 to 12,944 in 1969). In 1950, 65% of all patients had been hospitalized five years or more, 20% had been under care between one and five years, and the remaining 15% were hospitalized less than one year. These percentages are now 45, 25, and 30, respectively. Patients hospitalized for the short-term treatment of acute disturbances require much greater staff services than do chronic patients under care for extended time periods.

Latest available national statistics (for 1968) provide some indication of the relationship of employee-patient ratios to patient turnover and release rates. Arkansas, Colorado, and Nebraska (with 86.1, 133.9, and 105.8 employees per 100 patients, respectively) all had more live releases than admissions. The average size of their patient population decreased 53.3%, 62.4%, and 38.4% in the last five years. Alabama and Florida (with 29.1 and 48.2 employees per 100 patients, respectively) had more admissions than releases and were the only states with a reported patient population increase during this five-year period. Maryland, which ranked 21 in employee-patient ratios in 1963 and 24 in 1968, had a 7.4% decrease in the average size of its patient population during this period. Its four regional hospitals had more admissions than live releases.



It should be recognized that data on authorized staff can be deceptive if vacant positions are not taken into account. In June 1968, 298 of the 4,222 authorized positions were unfilled so that the ratio of employees to patients was reduced from 59.0 to 54.8. Furthermore, more than five employees are required for positions which have to be filled on a 24 hours a day, seven-days-a-week basis and many staff members are not directly involved in inpatient treatment. For example, one third of the Department's psychiatrists are either engaged in an administrative capacity or in the treatment of patients on an outpatient basis. Because of these factors, many hospital areas, particularly in chronic, long-term wards, continue to have minimal employee-patient ratios.

If current programs remain unchanged, the number of admissions to these hospitals will continue to increase 10% or more per year. This would produce a gradual rise in the proportion of beds occupied by acutely ill patients receiving short-term treatment. Based on these facts, the maintenance of appropriate employee-patient ratios and the development of alternative community-centered services is imperative.

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

The Pharmacological Approach To Alcoholism—*Part 1*

STANLEY E. GITLOW, MD
Associate Clinical Professor of Medicine
Mount Sinai Medical School
New York

The drug we will consider is ethyl alcohol, also commonly known as ethanol, and I want to start by orienting you as a pharmacologist would be oriented. The reason ethyl alcohol deserves special attention and has a disease associated with it called alcoholism is perhaps because it was the first of the sedatives to be discovered and it has always been used socially. Alcohol is easily available without a prescription, without a physician, and has become interwoven with the fabric of our society and our social functioning. That, I think, is the reason why alcohol, rather than one of the other sedatives, has become the basis for the title of a disease.

Alcohol is one of a group of aliphatic sedatives or soporifics which include liquid substances such as paraldehyde, solid drugs such as the barbiturates, and gases like ether and chloroform. These drugs are not narcotics, which take away pain but do not necessarily put one to sleep. The soporifics don't do anything against pain but do put one to sleep. They all belong to one group of compounds whose members possess similar pharmacological behavior. Quantitatively, there are differences in how quickly they start to act and how long they last, but they are all sedatives with the same qualitative effects. Perhaps a more correct title for this disease would actually be "sedativism." This "sedativism" is addiction to any one of the soporifics, and they are all grouped together in any good pharmacology text. What is it that they have in common? What is it that they do?

We will take one example, ethyl alcohol, and examine its properties. First of all, it is an irritant. When it is ingested, it irritates the stomach lining and increases the secretion of hydrochloric acid. Hence, lesions such as peptic ulcer, esophagitis, and diaphragmatic hernia, which are aggravated by the presence of acid, are all exacerbated by alcohol. It is also an irritant to the lower gastrointestinal tract, increasing motility and producing an outpouring of fluid, which will not infrequently cause enteritis or colitis.

In addition to its properties as an irritant, ethyl alcohol is the only drug known which is absorbed in significant amounts through the stomach lining. Thus, it will reach the blood stream faster than most other sedatives and will work sooner. Ethyl alcohol reaches measurable blood levels within 15 to 20 minutes after it is imbibed. Obviously, if you want to get a very quick blood level, you can breathe ether and it will be absorbed in a matter of seconds; indeed, there are people addicted to breathing ether, chloroform, or nitrous oxide, but these drugs are not so easily obtained.

Once alcohol reaches the blood stream, three things can happen to it. It can be excreted through the lungs (anyone who has taken a few drinks knows

Edited from transcripts of a lecture delivered February 24-25 and October 27-28, 1966, for the Alcoholism Interagency Training Project of the Community Council of Greater New York. This training program for social workers has been supported by the National Institute of Mental Health.

that others can smell alcohol on his breath). It can also be excreted through the urine. Both of these pathways take care of minimal amounts compared to the total amount of alcohol that has been ingested. Most of it is broken down to two carbon chain compounds which are the basic foodstuffs of the body. Once these have been formed, the particular food source is no longer important; the body doesn't care whether calories come from alcohol or potatoes or carrots. However, alcohol goes through an intermediate acetaldehyde step, which is important only because the body cannot tolerate aldehydes. Normally it is broken down very quickly by an enzyme called aldehyde dehydrogenase to produce acetic acid, which is innocuous and can be burned up as a foodstuff. However, there is an enzyme inhibitor known as disulfiram (Antabuse) which prevents the action of the dehydrogenase. Hence, the toxic acetaldehyde can no longer be eliminated. If an individual takes Antabuse, the enzyme inhibitor, and then drinks alcohol, he is left with the toxic acetaldehyde which will make him sick.

What determines the blood level of alcohol? The body has a limit as to how fast it is able to get rid of alcohol. The individual can metabolize about one ounce every two hours, and his blood alcohol level will remain fairly constant. When alcohol is ingested, a measurable blood level is attained within 15 to 20 minutes, reaches a peak at the end of the first hour or hour and a half, and by the end of the second hour, it starts down. The blood level reaches a normal (meaning unmeasurable) level within 12 hours. If the individual takes a very large dose, the peak will be higher and last a bit longer but the blood level will nevertheless reach zero within 24 hours. In other words, no matter how much the individual is capable of drinking at one sitting, all of the alcohol is gone from his body within 24 hours. If he has any left, he has been drinking after that first drink. If that were all there was to it, people would not be drinking alcohol socially because it would not serve any purpose. But when the alcohol blood level goes up, something happens in the brain, and that is the only reason alcohol is used.

The brain is essentially a switchboard with a large number of nerve cells (neurons) whose function is to transmit impulses from one point to another. The transmission of impulses depends on a group of biochemical events, and if you interfere with any one of these, you stop the neuron from functioning. You can stop it with a sledge hammer, with a right cross to the chin, or with a "chemical hammer"—it doesn't make any difference. If you were to use a large dose of cyanide to do this, you could permanently stop the nerve cells from working. On the other hand, ethyl alcohol will stop the cells from working, but in a reversible fashion: It will interfere with function, but the body is able to fight off the drug and repair itself. However, if you take enough, you can kill the nerves. Now I can hit you on the head with a hammer and leave you unconscious, or I can hit you on the head with a hammer and leave you dead. It's the same hammer, but it's a question of how hard I hit. So, too, with this drug ethyl alcohol. I can give enough of it to kill, or a small dose to stop only certain neurons from working. Man discovered long ago that temporarily stopping some of the neurons from working may be pleasurable.

All of the sedatives or soporifics—alcohol being only one of them—are irregular depressants of the central nervous system. By depressant, I mean a substance which diminishes or stops normal function. The sedatives are irregular, because if they depressed everything simultaneously, they would hit not only the thinking centers, not only the centers concerned with balance, but also the vital centers in the medulla which are necessary to keep the heart beating, the blood vessels contracting, and the lungs breathing. Any sedative which worked on these things evenly would be totally useless because it would kill as quickly as it would sedate. But all of the soporifics work first on the cerebrum and the cerebellum, secondly on the spinal cord, and finally on the vital centers. Hence, a little alcohol works only on the cerebrum (the individual gets a little confused or high); a larger dose knocks the person out and he is unconscious with no reflexes; and a large enough dose will kill him.

When alcohol depresses the brain, it diminishes the psychomotor activity level. The psychomotor activity level may be measured by the amount of anxiety or tension noted. Diminished psychomotor activity level means relief from anxiety and whatever it is that may bother the individual: insomnia, tension, job, or family pressures. When the person's blood alcohol rises, his psychomotor activity level goes down; he is relieved, relaxed, less anxious, less frightened, less worried than before. But as soon as the blood alcohol level starts to fall, this sedative effect diminishes, and even a big dose, such as a couple of jiggers, wears off very rapidly after the second hour. If that were all, there is a distinct possibility that we might not have the disease called alcoholism, because under those circumstances, an individual could drink to get relief, his anxiety level would diminish, the drink would wear off, and he would come back to where he was before. But that is not what happens, because there is another effect that acts in the opposite direction.

The second effect is to increase the psychomotor activity level. This increase takes place immediately after taking a drink, but is not immediately felt be-

cause the change is less intense than the sedative effect. This latter lasts two or three hours, while the opposite or agitating effect usually lasts for about 12 hours after one big drink. Therefore, as the short-term sedative effect wears off, the other effect of alcohol—increased psychomotor activity—becomes apparent. No one in this world can get a sedative effect from any known drug without it being followed by an agitating effect which wears off more slowly.

Near the end of the second hour after the original drink, when the sedative effect wears off and the agitating effect starts to gather momentum, the individual is more tense than he was before he drank at all. And so he will have another drink and the anxiety level will diminish again, but in about two hours, the psychomotor activity level will rise again, higher than ever. This cycle of increased tension, drinking, short-term sedative effect, longer-term agitating effect, higher tension, drinking again, can go on for some time. Eventually, however, a point is reached when decreasing the psychomotor activity level to a really low state is difficult, no matter how much alcohol is taken. This is because the agitating effects from all of the previous drinks are cumulative.

This agitating effect occurs in experimental animals and in humans; it is inherent in the pharmacology of the drug. You don't have to be an alcoholic in order to experience it. Anyone gets this effect if he drinks enough. For example, after an evening of heavy social drinking, you may have a hangover, the common name given to this condition of after-agitation. A drink (hair-of-the-dog) will relieve this because it provides sedation to counteract the agitation of last night's drinking. Of course, the morning drink is going to be followed by its own agitation for another 12 hours, but the drink may get you through a trying period until you begin to get a decrease in the agitating effects of the heavy drinking from the night before. By afternoon, you are feeling pretty well again. If, however, an individual has been drinking heavily over a long period of time, it may take many days for his psychomotor activity level to return to its normal state.

The person who has taken so much alcohol over a protracted period of time that his psychomotor activity level is extremely elevated may suffer one of several effects. He may shiver and shake, pace back and forth, sweat, palpitate, and show great agitation and tremulousness. This has been called a withdrawal state or syndrome, which is something of a misnomer since the individual may still be drinking all he can hold. However, his agitated condition is breaking through because he has raised it so high that no amount of current sedation can possibly reduce it to bearable levels. If at this point he runs out of money or has an accident, or for some other reason stops drinking and is left in his agitated state with no current sedation, he may suffer an extremely severe withdrawal syndrome. He may get alcoholic hallucinosis, which means basically that his brain is so irritable it sees, hears, or feels things that are not there. It makes up its own sensory input. And if the individual is even sicker, he will develop a condition known as delirium tremens (D.T.'s), in which not only the sensory input but the motor output has become tremendous, and he is literally unable to stop moving. He paces around, tears at his bed linen, hallucinates actively. A characteristic of this delirium is not only the tremulousness, but also absolute terror. The individual behaves as though someone were attempting to kill him. His psychomotor activity may reach the point where it causes spontaneous generalized convulsions.

Basically, this is a condition in which the brain is tremendously over-agitated. Thus, the man who merely had six drinks last night and is edgy this morning and the man with spontaneous seizures and a full-blown case of delirium tremens are suffering from the same disease caused by the pharmacologic effects of the sedative drug. It is just a matter of how much you take and how long you take it. One can produce D.T.'s with seizures in any individual at will, and in fact this has already been done with human volunteers who were not alcoholics. Probably the greatest single cause of adult onset convulsions in the U.S. today is alcohol. With a man who develops seizures in middle life, has never had them before, and is a heavy drinker, the cause is usually alcohol, not a brain tumor.

Up to now, we have assumed that what is happening is a reversible phenomenon, but this is true only up to a point. The central nervous system contains the only cells in the human body which never regenerate. Every other cell, including those of the peripheral nerves, can grow back or reduplicate, but brain cells, once destroyed, do not. The individual is born with the maximum number of brain cells he will ever have, and from then on, he has a decreasing amount throughout life. He never gets any more, and he is losing some, probably, every day of his life. Brain cells are destroyed by traumatic injury, by arteriosclerosis (less blood supply going to the brain as the person gets older) or by toxic substances. Fortunately, the individual may have many more brain cells than he needs, and if 10% of them are destroyed, the probability is that nobody will know the difference. On the other hand, if you lose 20% to 30%, even you may become aware that the memory is not quite there, that you can't think your way through a problem the way you used to. The brain just shrinks and eventually will be half the size of a normal brain. In a chronic alcoholic, after many years of drinking, postmortem examination will show

anatomic wasting of the brain. Now the alcoholic may, of course, do other things to his nervous system from poor eating habits, but the probability is that he can do this damage just with ethyl alcohol, even though he has a good diet the whole time, because ethyl alcohol can apparently injure the brain biochemically. It is probably a reversible injury most of the time, but not always, so that eventually brain cells will be destroyed. When enough of them are damaged, there are irreversible changes in the behavior and the psychological status of the individual. These may never return to normal no matter how long the person is sober and follows a good diet.

The effects of alcohol on other parts of the body are relatively unimportant, since they involve but a minority of heavy drinkers when compared with the effects upon the brain, reversible or not, which take place in 100% of alcoholics. For example, cirrhosis of the liver occurs in about 8% of alcoholics and 1% of the nonalcoholic population. There is also pancreatic disease in a very small percentage of alcoholics and an increased likelihood of pulmonary infections perhaps due to the sedation of the patient so that he does not adequately clear the secretions from his chest. There is also alcoholic cardiomyopathy, a disease of the heart muscle due to heavy intake of alcohol over a period of many years. All of these complications of heavy ethanol ingestion are comparatively rare.

Cardiac Irritability Secondary to Sympathetic Overactivity

RICHARD D. BIGGS, JR., MD
RICHARD P. WENZEL, MD
Chief Residents in Medicine
University of Maryland Hospital

A consequence of intensive observation of patients in coronary care units has been an enhanced awareness of cardiac arrhythmias. Principal among these irregularities have been those characterized by excessive irritability of the atrial and ventricular myocardium producing premature or ectopic beats.

Many disturbances of cardiac activity are associated with certain stages of coronary artery disease; indeed, it is probable that this disease is the most common cause of ectopic electrical activity. It is important to realize, however, that there are other causes of cardiac irritability. Some of these comprise a group characterized by increased activity of the sympathetic nervous system, by elevated levels of adrenal medullary hormones, epinephrine, and non-epinephrine or both.

Throughout the cardiovascular system, adrenergic receptors play important roles in controlling local and systemic hemodynamics. The heart is sensitive to alteration of sympathetic activity; it, however, is responsive only to beta-adrenergic stimulation. Such activity produces potent central effects, such as increased force of myocardial contraction, increase in heart rate, increased ability of certain cardiac tissues to conduct an electrical impulse, and increased automaticity. The latter is manifest by cardiac irritability and premature beats. Of course, not all factors which result in enhanced sympathetic activity will produce all of the effects mentioned. Exercise and augmented adrenergic discharge related to the anemic state, for instance, will often evince tachycardia and positive inotropism; such conditions will usually not produce excessive myocardial irritability.

Certain other disease states, however, are not infrequently associated with ectopic arrhythmias probably related to excessive sympathetic discharge. Pheochromocytoma with elevated production and circulation of sympathetic agonists is characterized by marked peripheral and cardiac effects; arrhythmias can be a disturbing feature. Thyrotoxicosis, through complex and potent influences, can produce prominent sympathetic activity. Atrial and ventricular irritability such as atrial flutter and fibrillation and premature ventricular contractions are seen. Recently, similar findings have been noted in tetanus. Just as external manifestations can be attributed to somatic neuromuscular irritability, so indeed can the profound diaphoresis, hypertension, vasoconstriction, and cardiac excitement be linked to sympathetic nervous system irritability.

In general, therapeutic efforts in myocardial irritability are directed at suppression of ectopic foci. Agents such as procainamide and quinidine are relatively nonspecific suppressants of electrical irritability. These drugs might be used appropriately to counter ectopicity due to any cause. Quinidine sulfate is usually given orally in doses of 200 mg to 400 mg every six hours; procainamide, 500 mg every six hours, is given by the same route. Recently lidocaine, successful as a local anesthetic, has been recognized as an effective antiarrhythmic agent. With a

mode of action similar to that of quinidine, this drug is given intravenously. An injection of 50 mg to 100 mg followed by an infusion of 1-4 mg/min is commonly used. Lidocaine has enjoyed great use in intensive care units, particularly for ventricular arrhythmias.

Myocardial irritability related to increased adrenergic activity is also amenable to another form of therapy. If, as suggested above, arrhythmias are precipitated by enhanced sympathetic discharge, then blockade of this mechanism should ameliorate the condition. This seems to be the case with the use of beta-adrenergic blockade. Propranolol, the only such drug currently available, has been suggested to block beta activity, both peripherally and centrally in thyrotoxicosis, pheochromocytoma, and tetanus. In addition to beta-antagonism, propranolol possesses a nonspecific quinidine-like action rendering it useful as a general antiarrhythmic preparation. This drug is most effective in the acute situation when given intravenously by slow injection of 0.5 mg to 1 mg repeated after 30 to 60 minutes as needed.

It must be cautioned, however, that propranolol and other beta-adrenergic blocking drugs are to be used sparingly, if at all, in those situations in which cardiopulmonary integrity is dependent upon high levels of sympathetic activity. Patients with bronchial asthma and moderate to severe heart failure may be adversely affected by the administration of drugs which antagonize beta activity. Similarly, situations characterized by bradycardia or heart block or both might be aggravated by antisympathetic medication.

In conclusion, myocardial electrical irritability may have many causes. Nonspecific suppressant therapy may be beneficial in many cases. In certain cases in which sympathetic overactivity can be implicated as a mechanism for ectopic activity, drugs which provide beta-blockade may play a decisive role in management.

Baltimore City
health department

Health Highlights of 1970

A record-breaking reduction in the number of new active cases of tuberculosis was the most outstanding public health achievement for Baltimore city in 1969. The drop, a dramatic 20% in comparison with the previous year, is a major breakthrough in the city's fight against this disease. New active cases totaled 500—down 122 cases from the 622 reported in 1968. Particularly gratifying is a 53% drop in the incidence of tuberculosis in children under 15 years. Twenty-eight youngsters were victims of the disease in 1969, compared with 60 the previous year.

The gains have been achieved through the infusion of federal funds and the direction given by Allan S. Moodie, MD, Director of the Bureau of Communicable Diseases and an international authority on tuberculosis control.

In 1969 the city's budget for tuberculosis was $925,000, of which $389,000 was provided by the U.S. Public Health Service. These funds made possible the expansion of several recent developments in prevention and treatment. During the past five years the number of residents on antituberculosis drugs has grown from 2,700 in 1965 to 6,750 in 1970. About 50% of this latter group are being treated for active disease while the remainder are persons who are infected with the germ as indicated by the tuberculin test. In view of recent cutbacks at the federal level, no funds have been allocated for tuberculosis programs by the Public Health Service to Baltimore city for 1970. Unless the state and city governments are able to fill the gap, our advance against tuberculosis will be short-lived.

Other Significant Accomplishments

1. With leadership by the Baltimore City Health Department, an aggressive, coordinated attack on malnutrition initiated by the Mayor's Task Force on Nutrition in cooperation with city, state, and federal agencies, including some voluntary groups. Improvements included an expanded school lunch program, greater availability of food stamps, and an iron-enriched milk program for children in Model Cities and those from poor neighborhoods. Staff members from the Department also participated in the White House Conference on Nutrition.

2. The expansion of alcoholism services through training and education, counseling in the Municipal Court, establishment of a recreation-treatment center, and the appointment of a liaison counselor to state mental hospitals and improved transportation for alcoholics to these institutions.

3. The formation early in 1969 of a Mental Health Advisory Council to evaluate the city's mental health programs and to recommend needed changes. This was followed by the appointment of the Reverend Fred Hanna as Coordinator for Drug Abuse Programs and the extension of mental health services for children in the Eastern and Southeastern health districts by additional staff and facilities. Another forward step in meeting mental health needs included the implementation of a Geriatric Evaluation Service that aims to prevent unnecessary mental hospitalization of the elderly through utilization of community resources.

4. A new approach to rat control and environmental hazards through the establishment of a 34-man Sanitary Enforcement Division which is coordinating its efforts with the Department's Rat Eradication Program and other city agencies and civic groups.

5. Progress in air pollution control through a $267,000 grant from the U.S. Public Health Service to reinforce current activities, industry cooperation in the installation of needed air pollution control equipment, and enforcement of the open-burning ban.

6. Increased family planning services supported by a $400,000 U.S. Children's Bureau grant to the Baltimore Maternity Center.

7. The inauguration of a German measles immunization program for school children as part of

a state-wide campaign conducted jointly by the state's medical societies and health departments.

8. A dental care program for Model Cities school children and other children in selected schools in which a new long-lasting fluoride paste was applied to the teeth of 10,000 children to prevent tooth decay. By June 1970 some 30,000 children will have received this treatment.

Population

The estimate of the resident population for July 1, 1969 was 907,000 persons. This indicates that the population of Baltimore city has continued to drop, and that 11,000 persons left the area between July 1, 1968 and July 1, 1969. This decline is the net result of a sizable drop in the white population from 505,000 to 489,000 persons and an increase of approximately 5,000 persons in the nonwhite population (from 413,000 to 418,000). In 1969 the nonwhite population constituted 46% of the total population compared to 45% in 1968.

Births

With a drop of approximately only 500 in the number of live births among the city's residents in 1969, compared to annual declines of 1,000 or more in the last several years, it appears that the recent period of rapid decline in the number of resident births is leveling off. In 1969 there were 16,196 resident live births, 3% below the number for 1968. During the previous two years, the annual declines had been in the range of 6% to 7%.

Deaths

The resident death rate of 13.0 deaths per 1,000 population showed little change from the rate of 12.8 for 1968. However, there were several noteworthy changes in the specific causes of death.

1. Although the number of deaths from all forms of cancer decreased slightly, deaths resulting from cancer of the lung continued to increase with 479 persons dying from lung cancer in 1969 compared to 412 in 1968 and 398 in 1967. In the last 5 years, lung cancer deaths have increased by 36%.

2. The number of accidental deaths dropped by almost 15% from 498 in 1968 to 424 in 1969 with all categories of accidental deaths showing declines. This is the third straight year showing a decrease in resident deaths resulting from accidents.

3. The infant mortality rate declined by 3.5% after a sudden increase in 1968 which interrupted the steady annual downward trend of the previous three years. In 1969, there were 27.5 deaths per 1,000 live births compared to 28.5 in 1968 and 26.2 in 1967. Maternal deaths totaled eight, the same as for 1968 and 1967.

4. Leading causes of death according to provisional statistics of the City Health Department's Bureau of Biostatistics were as follows: heart disease—4,524, up 22 deaths from 1968; cancer—1,986, down 20; cerebral hemorrhage—852, down 107; pneumonia—369, down 80; diabetes mellitus—364, down 47; cirrhosis of the liver—350, up 21 deaths; and congenital malformations and diseases of early infancy—329, down 29. Homicides were fewer in 1969 by 15 deaths while suicides rose from 98 in 1968 to 113 in 1969.

Reportable Diseases

Among those diseases for which preventive vaccines are available, there were no cases of diphtheria or poliomyelitis, one case each of tetanus and typhoid fever and only eight cases of whooping cough among city residents in 1969. Although there were slightly more cases of measles reported in 1969—a total of 63 compared with 56 in 1968—continuation of the incidence of this disease at such low levels compared to case counts of 1,500 to 2,000 during the first years of the decade marks the impact of the introduction of a preventive vaccine for this disease.

Cases of other childhood diseases—chickenpox, mumps, and German measles—were near the 1968 levels.

Reports of gonorrhea increased sharply in 1969 with 9,822 cases reported compared to 7,379 in 1968. Much of this 33% increase has resulted from the introduction of screening examinations for gonorrhea during routine examinations of women at selected hospitals and clinics.

Cytomegalovirus and the Post-Transfusion Syndrome

ROBERT L. CAVENAUGH, MD
Director, Bureau of Laboratories
Maryland State Department of Health

The crucial need for first evaluating the potential clinical advantages of prescribing the transfusion of blood in contrast to the risks involved before it is administered has been well established in medical practice for many years. Recently, a new risk has been clearly delineated—the chance of infecting the recipient with cytomegalovirus inclusion disease (CID), which may be serious or fatal in some patients. It seems incumbent that pathologists and others who may give consultations prior to transfusions should be informed regarding this hazard.

An editorial in *The Lancet,* September 6, 1969, gives an excellent review of this interesting and challenging complication called the post-transfusion or the post-perfusion syndrome or post-transfusion mononucleosis, first reported by Battle and Hewett in 1958[1] and, subsequently, by many others. Characterized by fever, splenomegaly, and atypical lymphocytes in the blood, its development three to six weeks after transfusion led many to the opinion that it resulted from an infection transmitted with the transfused blood. First observed in patients following open heart surgery, the post-transfusion syndrome was also found to appear after simple transfusion. This narrowed the investigation of possible causes. Such factors as age, sex, and blood group of the patients involved could not be correlated in the various cases studied, nor could the underlying diseases for which the transfusion was given, the type of surgery, the technique of the transfusion, or the use of blood additives. One common factor remained—the transfusion of fresh blood (less than 24 hours old) often used in large amounts.

Observations by Klemola and Kaariainen in Finland[2] pointed out in 1965 the titer-rise of antibodies to cytomegalovirus (CMV) in patients with "seronegative mononucleosis". All five of their reported cases, like nearly all of those subsequently reported, proved negative to the Paul-Bunnell heterophil test. Kaariainen and associates[3] documented in 1966 the recovery of CMV in one of five additional cases. In later work by Lang and associates[4,5] at the Massachusetts General Hospital at Boston and the Duke University School of Medicine in Durham, N.C., virus was recovered from all patients—from the urine, the throat, or from leucocytes.

These studies clearly establish an association between the post-transfusion syndrome and cytomegalovirus infection. But whether this infection is transmitted by the transfused blood or becomes manifest by activation of a previously inapparent harboring

of the virus is not conclusively proven. Studies indicate that the antibody response following the transfusion is primary, rather than due to an anamnestic response of immune mechanisms sensitized by previous exposure to the virus. The increased antibodies developed in these cases are of the IgM group of globulins, such as those usually developed as new-formed antibodies after a primary infection.[6] Furthermore, the latent period after transfusion before antibodies rise to detectable levels is too long to represent simple recall. The question of passive transfer of antibodies from the donor to the recipient has also been considered, but such antibodies are short-lived in contrast to antibodies formed endogenously. The possibility exists that a recipient who does not have pre-existing antibodies against CMV may be more susceptible to the post-transfusion syndrome. Paloheimo, an associate of Kaariainen and Klemola,[7] found that such recipients may indeed be more susceptible. However, they found that while pre-existing antibodies may modify the course of the post-transfusion syndrome, they do not give solid protection against it. Further studies on this subject are needed, since it has been found that the CMV is antigenically heterogeneous.

Knowledge gained so far as a result of the observations from Helsinki[2] shows: (1) The clarification of at least three types of CMV infection, and 2) The danger of the post-transfusion syndrome. Earlier observations tended to divide cases of CMV infection into only two groups: either a serious disease, with mental retardation possibly associated with subependymal brain degeneration and calcification, or a mild or inapparent infection followed by a rise in antibodies. A case similar to those in this latter group was found in a study by Foster and Jack,[8] who stored donor serum and then took subsequent specimens if the recipient developed the post-transfusion syndrome. One such "donor" of the syndrome had developed a coryza-like illness; the donee developed post-transfusion syndrome. In another patient complaining of no symptoms, CMV was isolated from the urine. Now, however, it seems that a third group of cases of CMV infection is indicated—those with the post-transfusion syndrome. This infection is usually benign and self-limiting, manifested by the fever, splenomegaly, and lymphocyte findings mentioned above, and characteristically, by the absence of pharyngitis. Test results of liver function often are abnormal, but clinical evidence of liver disease is rare. If lymphadenopathy is present, it is minor. Some patients have had a skin rash.

Merely because the post-transfusion syndrome is in itself a mild illness should not dispel the concern of physicians: Patients with impairment of the immunological mechanisms either as a result of disease or following immunosuppressive therapy are particularly susceptible to opportunistic infections, and CMV has been found to cause death in such patients. Of particular importance is the likelihood, following transfusion of fresh blood to a pregnant woman, of transmitting the CMV infection to the fetus *in utero*. The development of congenital CMV, or even CMV in the newborn, is a serious complication.

From the practical viewpoint, prevention through adequate consultation is of prime importance. If transfusion of a pregnant woman is absolutely necessary, the following precautions seem indicated: 1. The transfused blood should, if possible, have been stored over 24 hours. 2. Some serum from the pilot tube of donor blood should be stored frozen for at least eight weeks. (As isolation of this delicate virus requires seven to ten days, cultural studies would be useless and costly.) 3. If the recipient develops symptoms suggestive of the post-transfusion syndrome, the donor should be recalled and specimens of blood, urine, and throat washings (or a pharyngeal swab taken on a dry, sterile cotton applicator then placed in 2-3 ml nutrient broth) should be taken for virus-isolation studies from both the donor and the recipient; subsequent blood from the recipient at intervals of 14 and 21 days should be taken for comparative determination of antibody level. These specimens should be sent, without delay of more than two to three hours, to the Virology Division of the Maryland Department of Health Bureau of Laboratories. If longer delay cannot be avoided, the blood serum should be separated and, along with the other specimens, should be frozen and shipped as soon as possible at dry-ice temperature. A careful clinical summary giving accurate dates of transfusions, specimens, and of onset of symptoms is of importance to guide the laboratory studies. Consultation is advisable in any unusual case or, of course, when a termination of the pregnancy is considered.

DOUGLAS G. CARROLL, MD, EDITOR

rehabilitation notes

Spinal Cord Injury: Psychiatric Considerations

NORMAN J. KNORR, MD
Associate Professor of Psychiatry
Associate Professor of Surgery
Johns Hopkins School of Medicine

JOHN C. BULL, JR., MD
Resident in Plastic Surgery
Fellow in Plastic Surgery
Johns Hopkins Hospital and School of Medicine

Spinal cord injury evokes emotional reactions that are common to many chronic illnesses which result in physical disability. The relative youth of many patients, the severity of the physical disability, the physical complications and emotional problems which beset the patient's clinical course, and the duration of rehabilitation makes the cord-injured patient one for special consideration. The 21-year-old man who, suddenly after sustaining trauma, experiences loss of motion of the lower extremities, loss of bladder and bowel control, and concomitant loss of sexual function, demonstrates the magnitude of the problem. This paper will review the psychiatric manifestations of spinal cord injuries as they are related to the acute trauma, physical disability, and the ultimate rehabilitation of the patient.

Many young adult men are considered accident prone and their sustaining trauma is frequently the result of behavior called "impulse dominated".[1] Insurance companies charge higher premiums for motorists under 25 because their experience indicates a higher accident rate among this group. The assertive personality factors that contribute to "accident proneness" in the young man may also contribute to the aggressive and sometimes angry behavior which results in difficult behavioral management problems after injury. The young patient who has not settled the important issues concerning his future, in particular his vocation, marriage, and social ambitions, and who is attempting to test and challenge the environment in a manner which will ultimately decide the course of his adjustment, is also a challenge to a treatment team who accepts responsibility for his medical care and rehabilitation.

Paralysis: Cord injury that produces paralysis, ie, paraplegia or quadraplegia, renders the patient helpless and frustrated. Initially, the hope for recovery of function is supported by the patient's use of denial and sometimes the attitude of "wait and see" that prevails among those providing medical care to the patient. Those patients with severe cord injury will maintain covert hopes of recovery even when the optimistic phase of treatment fades, and these hopes are frequently supported by various sensations in the paralyzed extremities. Day and sleep dreams are filled with imaginary happenings that find the patient walking and carrying on as if he were in the pretraumatic state.[2] The psychological necessity of maintaining body integrity and preserving "body image" is normal and is found in all patients who are severely traumatized. This point is emphasized by the patient who, after years of paralysis, will ve-

From the Department of Psychiatry and Behavioral Sciences and the Department of Surgery; The Johns Hopkins University School of Medicine and Hospital, and The Baltimore City Hospitals.

hemently refuse amputation of limbs which is deemed essential by the surgeon to cover massive and sometimes life-threatening ulcerations of the patient's buttocks. It is indeed unfortunate that the vast energy the patient expends in wishing and hoping for total recovery cannot be used in facing the reality of the task that lies before him, ie, his rehabilitation and return to society as a functioning person. Since each patient must use his energy in this manner, hoping for total recovery, it is foolhardy to even consider his immediate adjustment a possibility. Only after an appropriate length of time can he be expected to accept his injury and prepare for his future.

The patient's psychological need to maintain control of his own body functions may reduce his motivation for participating in his physical rehabilitation. The rehabilitation team's efforts are thwarted by the patient who demonstrates feelings that the rehabilitation program planned for him is really not necessary. The goals of treatment sought by the patient and the goals of the treatment team are different, and a "treatment struggle" is often encountered with its many problems. When the patient comes to accept his disability and his need for rehabilitation, he has reached an important milestone in his overall adaptation to disability. This acceptance indicates that not only has the patient given up many of his hopes for complete recovery, but he has also worked through a grief reaction which involves accepting his loss (paralysis) and also accepting the fact that he will never regain his "old self".

Bowel, Bladder, and Sexual Function: These functions are grouped together because patients who experience these losses of function tend to group them this way in their minds. To help the patient separate his thoughts of excrement and urine from thoughts of sexual function is a useful concept. Following loss of these functions, the patient feels "dirty", degraded, and inadequate, and experiences high anxiety concerning his loss of "manliness". Frank and open discussion concerning these losses of function and what function the patient may anticipate for the future can be very helpful, rather than leaving the patient confused and with unrealistic expectations. Many paraplegics make a sexual adjustment that they feel is rewarding, since they are frequently able to satisfy their sexual partner.[3] Genitopelvic sensations may be absent and sexual feelings and urges are usually reduced.[4] This combination of factors helps to reduce the intensity of need for sexual self-satisfaction. The quality of sexual adjustment is, of course, dependent on the maturity of the cord-injured patient and his spouse or partner.

Emotional Reactions: The most common psychological response to acute disability following trauma is depression. All patients with spinal cord injury show an immediate depressive mood and affect which is deemed situational.[5] Varying degrees of anxiety accompany the depression and are frequently related to the amount of pain and the severity of disability. When the patient's cord injury results in paraplegia, the depression may be severe and last many months. This reaction is normal and is probably best understood if the patient is considered to be "in mourning" for his personal loss, ie, the loss of physical stability and mobility.

The intensity of this depression will also vary according to the psychological defenses that may be used by the patient. The paraplegic who uses conscious and unconscious "denial" that he is injured and disabled may appear cheerful and relatively unconcerned about his physical status. If this defense is sustained, the patient may take an unrealistic attitude toward his injury and disability, hospital care, and rehabilitation. Most patients will utilize this defense for varying lengths of time, and it allows for periods of good mood and low anxiety which are a welcome relief to the patient, and to the staff. Since the patient must eventually face the realities of his situation, this defense is not sustained, and the patient finds himself in periodic depths of despair.

The physician and hospital staff who are responsible for the care of the paralyzed patient will intuitively manage the patient's use of denial. This is done appropriately in most cases and without the staff being able to verbalize the basis for their interactions with the patient. It is not unusual to find that patient denial is supported by the staff immediately after injury to avoid the patient becoming overwhelmed with anxiety. This may lead to later distrust of the medical staff whom he feels was not honest with him. Conversely, patient denial may be interrupted by a "heart to heart" or "man to man" discussion between the patient and staff when denial is interfering with and deleterious to patient care or rehabilitation, or both. At this stage he may cling to the hope, previously instilled by well-meaning staff, of further improvement, and thus prolong his adjustment period.[6]

The reactive or situational depression can extend beyond the normal length of time, and a pathological depressive reaction then ensues. The patient may experience insomnia, have crying spells, express guilt feelings, and berate his own person. Outside interests are severely restricted, and the patient adopts the attitude that he does not care if he lives or dies. He may harbor suicidal ideation but will rarely attempt suicide.[5] Pathologic depression is sometimes a difficult diagnosis to make since it overlaps the reactive depression. Diagnosis is established by the degree of depression and the length of time that it continues after injury. The reactive depressions tend to subside on their own after two to four months and without interventions other than the medical and emotional support usually provided the patient by the treatment

team. Supportive psychotherapy and antidepressant drugs may become necessary and are useful in treating the pathological depression.

Depression can be expressed by maladaptive behavior. This may take two forms. Some patients may severely regress and show an infantile type of reaction. They wish to be cared for completely and cannot be motivated to become active in their own treatment. The other form of maladaptive behavior is the aggressive reaction evidenced by the hostile, argumentative patient who alienates the ward staff. This type of patient will challenge those responsible for his care with hostile, negative attitudes and will tend to berate the performance of the nursing staff. The depth of this patient's depression is sometimes exhibited when the hostility and anger give way to a crying spell. Both of these forms of behavior are a challenge to those caring for these patients, and each patient's reaction deserves careful consideration. Regular meetings of the staff where individual patient behavior can be considered in some depth and detail can be very helpful to both the patient and the staff. In fact, all members of the team who have responsibilities to the patient should attend such meetings in an attempt to solve the sometimes severe problems encountered in the management of these patients. The dangers of these two forms of behavior are that the regressive type will go unnoticed by the medical staff, while the aggressive type will lead to patient alienation and may result in an unconscious decrease in effort on the part of the treatment team.

Adjustment Variables: The variables that influence the patient's eventual adjustment to disability include: 1. the extent of physical injury, resulting physical complications, and the success of his physical treatment; 2. the pretraumatic personality, "What was he like prior to the trauma?"; 3. the level of dependency the patient can adjust to following the injury and while hospitalized; 4. the intensity and duration of the emotional reactions experienced following the injury and the resulting emotional support and treatment supplied the patient by the medical staff and the patient's family; and 5. the patient's physical ability to resume his former vocation and way of life.

The patient who recovers smoothly without multitudes of physical complications and who has the opportunity for quick, effective rehabilitation will present fewer difficulties to the treatment and rehabilitation staff. When physical injury is complicated medically, the patients are apt to experience "setbacks". It is not unusual to hear a member of the treatment team say, "He was fine until he developed the bladder problem after the last surgery." Depression and anxiety are aggravated at these times, and the patient will sometimes suggest he is "giving up". Additional emotional support supplied the patient during these crises and forewarning him of complications that may be anticipated can be helpful in supplying him needed emotional comfort. Optimism concerning the patient's recovery by all those attending the patient is essential when the clinical course is beset with these complications.

The problem of pain and the consideration of tranquilizers is a useful adjunct to the early care of the spinal cord injured patient. Pain tends to interrupt the patient's psychological defenses which are essential to his controlling anxiety. If the anxiety is reduced by tranquilizers, it allows the patient to regroup his defenses and the pain-anxiety cycle may be effectively broken, ie, the pain is made worse as the anxiety level rises and the increased anxiety results in more complaints of pain.

The patient's pretraumatic personality is important.[5] It is difficult to rehabilitate a patient who, in fact, was a psychological or social rehabilitation problem prior to the trauma. If a patient has functioned adequately on social levels and was stable and emotionally mature prior to trauma, you may anticipate that he will function at the same level during the rehabilitative process, barring the possibility of prolonged physical complications. The pretraumatic personality is difficult to assess for the first few months following trauma. If the patient was wreckless, immature, and sociopathic prior to the trauma, this same personality will emerge sometime after the injury and will present many problems in patient care and rehabilitation. Since the magnitude of the disability from spinal cord injury can overshadow the personality factors early in treatment, it is wise to interview the patient's family and attempt to reconstruct the patient's social and vocational history to given an impression of what the patient may be like when he is ready for rehabilitation. It is also helpful to consider the circumstances of the trauma. Patients who feel that their trauma was the result of someone else's negligence, or are resentful because they feel they don't deserve their fate are more apt to prolong the rehabilitative process and become management problems during their course of treatment.

The level of dependency that the patient can assume following his injury is an important factor in his acute treatment and his motivation for rehabilitation. The patient who assumes an exclusively dependent position will present problems of motivation for treatment since he fully anticipates that all of his needs will be cared for by others. This may seem desirable early in the acute treatment stage, but as the patient improves physically, it is noted that "he will not help himself". The treatment staff is apt to express anger toward such a patient for his inability to participate in his own treatment, and this anger will further complicate the patient's treatment because of his reaction to this anger. Regressive behavior is common in these patients and the medical staff will frequently refer to this kind of patient as a "baby".

The staff feels a strain in that the patient is making them completely responsible for his well being and eventual rehabilitation.

The contrasting patient is the hyperindcpcndent patient who resents and, at times, refuses care. Hc will present the staff with a "who needs you?" attitude. It is not unusual that this patient will physically harm himself by trying to do more than he can really accomplish on a physical level. This same patient may show agitation and may throw an object, such as a urine duct, at a member of the treatment staff. It may require a psychiatrist to help resolve this kind of problem in the treatment unit. Working not only directly with patients, but also supplying staff with an understanding of the patient's problem and feelings will frequently alleviate the problem and allows the patient to settle into an optimum dependent position. It is the author's experience that the hyperindependent patient will respond to effective psychotherapeutic interviews more quickly than the very dependent patient.

The patient's family needs special attention, particularly the spouse. The usual difficulty encountered between patient and spouse during the acute treatment stage is the patient's attempt to "push her away". This is at a time when the patient is berating himself and feeling useless, and when he is confused about his future sexual status. Supplying emotional support to the spouse via counselling is essential, particularly if she is emotionally immature. A thorough explanation concerning what she may anticipate in terms of the patient's sexual and other physical functioning is necessary. The result is hopefully that the spouse will reassure the patient. On occasion, the spouse may feel overwhelmed with the patient's need to be dependent, and her inability to successfully reassure him. The spouse who feels overwhelmed by the tragedy that has befallen the family and her husband's demands on hcr, may tcnd to withdraw with very deleterious effects on the patient. A social worker who will cvaluate and help work with the spouse's problems is an important ingredient in the treatment team. Although there are no statistics available, our clinical impression is that the divorce ratc is high in paraplegic marriages.

The patient's ability to assume his former vocation is sometimes vital to his self-image. This is a particular problem if the patient is a skillcd worker and, following severe physical trauma, finds that he cannot continue in his former job. The bricklayer who is earning $4 an hour and who is not competent to do other work is a classic example. These patients are very resentful and extremely difficult to rehabilitate vocationally. Not only is their physical self-image shattered, but also their status as a high-wage earner. The level of depression is often extreme in these patients and several attempts at vocational rehabilitation may be necessary before any success is achievcd. It should also be noted that if the patient is maintained in the hospital at the same level of income that he was earning prior to injury, this may decrease to some extent his motivation for rehabilitation.[7]

Summary: This paper presents somc of the emotional complications of spinal cord injury, thcir evaluation and treatment. It also reviews the ability of various typcs of patients to adjust to their disability and shows how a treatment team may be helpful to these patients. The theme of this paper is that a team approach, utilizing all aspects of medical, surgical, social and psychological resources, is necessary for the total recovery of these patients.

Penicillin Will Kill 300 in 1970

Penicillin, the "wonder drug" that has been a life saver to millions of Americans, has become a lethal threat to thousands of them every year, say medical authorities.

At least 3,000 or more people in this country went into shock before the end of 1969 after taking the drug.

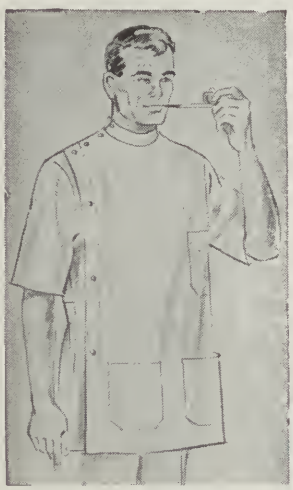
About 300 died because of it.

And this year the situation could grow worse.

Some authorities believe that the prevalence of pencillin in our food—in meat and milk, for example, from animals treated with the drug—may be sensitizing more people and making them prone to an anaphylactic shock (extreme sensitivity).

And penicillin is the most frequent cause of anaphylaxis.

Yet, clinicians still have no reliable means of telling which patients will have a severe reaction to the drug.



Most physicians today rely on their records, and on a ready bottle of a drug called epinephrine to treat the shock if it develops.

Researchers at several U.S. and Canadian centers are working on tests to solve the problem, but none is currently available to private practitioners. The situation is not expected to change in 1970.

Benefits of Illness

That society may materially benefit from the illness of the individual is perhaps not too well appreciated by the majority of physicians, continuously indoctrinated as they are from their earliest student days with the necessity for stamping out disease and alleviating suffering. In previous centuries the hypermetabolic state associated with advanced pulmonary tuberculosis inspired many famous artists and composers to heights of artistic accomplishment.

Today, this peculiar synergism between talent and disease is seen most frequently in the realm of the psychiatrist. Many intelligent and gifted persons with manic-depressive psychosis show tremendous creative productivity during their manic swings and will often elect to endure the subsequent episodes of depression rather than have these cyclical swings smoothed out by drugs like Thorazine or lithium.

The superior achievers in our society also seem to be peculiarly prone to develop psychosomatic illnesses when physical and mental pressures become overwhelming. Often, these illnesses appear peculiarly suited to the individual's particular life situation. The singer develops laryngitis; the star pitcher, a sore arm; and the thinking executive, migraine. These illnesses are beneficial in that they allow an honorable and socially acceptable retreat from an overwhelming and ego-threatening situation, thereby preventing personality disintegration. Misguided attempts by physicians to overtreat and cure these essential ills may reduce talent to mediocrity and in rare cases result in complete physical and mental breakdown.

Nobel Laureate Lauds Oranges

Can an orange a day keep the psychiatrist away?

Large doses of vitamin C (found in fresh fruits, especially citrus, tomatoes and vegetables) were highly recommended during 1969's second International Congress of Social Psychiatry.

Taking about ten times the recommended dose of vitamin C daily under a physician's care, according to Dr. Linus Pauling, professor of chemistry at the University of California, San Diego, and a Nobel Prize winner, can provide the average person with:

- Increased vigor.
- Increased protection against infectious disease including the common cold.
- An increased rate of healing of wounds.

In addition the Nobel laureate said he and his colleague, Dr. Arthur B. Robinson, had found an abnormally low level of ascorbic acid (vitamin C) in the body fluids of about one third of schizophrenics they had examined. This was borne out by other investigators.

Did You Know?

Nearly 169.5 million Americans were privately insured against hospital expenses at the beginning of 1969—an increase of 6.6 million over the beginning of 1968.

- About six out of every seven persons in the United States have some form of private health insurance protection.
- Insurance companies insured more than 104 million people as the year began—4.8 million of them over 65 years of age.
- Increases in coverage were registered in all major categories of health insurance in 1968.

Staff News and Review

Since the last *Library Page* was published in February, Med/Chi has added a full-time Assistant Librarian in charge of Cataloging and Acquisitions—Mrs. Judith Rae Pochciol (pronounced 'Po-shol'). Mrs. Pochciol comes to us from Western Psychiatric Institute and Clinic in Pittsburgh, Pennsylvania. We welcome her to the Med/Chi staff with pleasure.

Having missed the March issue of the *Journal*, it was too late to invite you to visit the library exhibit at the Annual Meeting, but we hope everybody remembered to browse among the new books on display. The library's acquisitions will increase as we can secure more staff to process orders and cataloging, but new books will not help you if you never visit the library or request that information be sent to you.

On one of Mr. Lee Ash's visits to this library, he found an interesting supplement to the *Danish Medical Bulletin* of November 1969 (volume 16, supplement IX) and wrote the following comments:

> "Studies in the Mediaeval Diagnosis of Leprosy in Denmark" is an exciting and unusual osteo-archaeological, historical, and clinical study, by Johs. G. Andersen, a senior medical scientist in the field of leprosy, while he was on special assignment to the Medical Historical Museum at the University of Copenhagen. As a worldwide study of historical and literary sources, of correlation with osteological remains, and reference to mediaeval and contemporary pathological examples, the volume is a fine demonstration of the application of historiographical principles to some problems of comparative history. Its relevance to medical history and to other literary and historical studies is readily demonstrated in nearly twenty "General Conclusions".
>
> If you have an interest in leprosy, this supplement is available in the Med/Chi library.

* * *

Due to the forced cancellation of the meeting of the Baltimore Chapter, Special Libraries Association, originally planned for the Sunpapers Library to host, the Med/Chi library acted as host for a visit from local librarians to this library. After a short sketch of the library's history, guests were escorted to the upper stacks where Mr. Ash explained the process involved in surveying a historical collection such as ours and showed some of the "gems" he has unearthed there.

This was followed by a smorgasbord at the Deutsches Haus and an interesting and humorous talk by Mr. Ash on "A Variety of Experiences During My Years of Librarianship".

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the MARYLAND STATE MEDICAL JOURNAL.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the JOURNAL and are not returned. The JOURNAL is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, MARYLAND STATE MEDICAL JOURNAL, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a minimum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the JOURNAL. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number. the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with JOURNAL style.

Statements made or opinions expressed by any contributor in any article or feature published in the JOURNAL are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the MARYLAND STATE MEDICAL JOURNAL is protected by copyright and may not be reproduced without the written permission of both the author and the JOURNAL.

When disease is ruled out and psychic tension is implicated

Valium® (diazepam) helps relax the patient and relieve his somatic symptoms

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Increased interest rates on savings certificates

from Baltimore Federal

Now you can earn increased interest with one of Baltimore Federal's three new savings certificate plans — higher interest that means so much in down-to-earth terms, in the ways you want to enrich life for your family and yourself.

Baltimore Federal now offers 5¼% per annum on certificates of $1,000 or more invested for six months . . . 5¾% per annum on one-year certificates of $5,000 and up . . . and a whopping 6% per annum on certificates of $12,000 or more invested for two years. All certificates may be purchased in larger-than-minimum amounts in $1,000 increments.

Interest on all three certificate plans is compounded and credited quarterly, or paid direct to you by check.

And your investment is well protected by Baltimore Federal's strong reserves and insured up to $20,000 by the Federal Savings & Loan Insurance Corporation.

Stop in at any convenient Baltimore Federal office and talk over the best savings certificate plan for you. Let Baltimore Federal put a little more of the good life in your life.

BALTIMORE FEDERAL
Savings & Loan Association

Fayette and St. Paul Streets / Eastpoint Shopping Center / Reisterstow
Road Plaza / Towson at 7 Alleghany Avenue / Carney at 9609 Harford
Road / Yorktowne Plaza Shopping Center / Columbia, Teachers Buildin
Westminster at 6 East Main Street / Frederick at 16 East Patrick Street

p.s. More good news for our savers!
Baltimore Federal has increased its interest r
on passbook savings to a handsome 5% per annum. T
increased rate coupled with a high degree of flexibility (
may deposit or withdraw your savings at any time in
amount) makes a Baltimore Federal passbook account a
attractive way to save.

Lutrexin®

HW&D BRAND OF LUTUTRIN

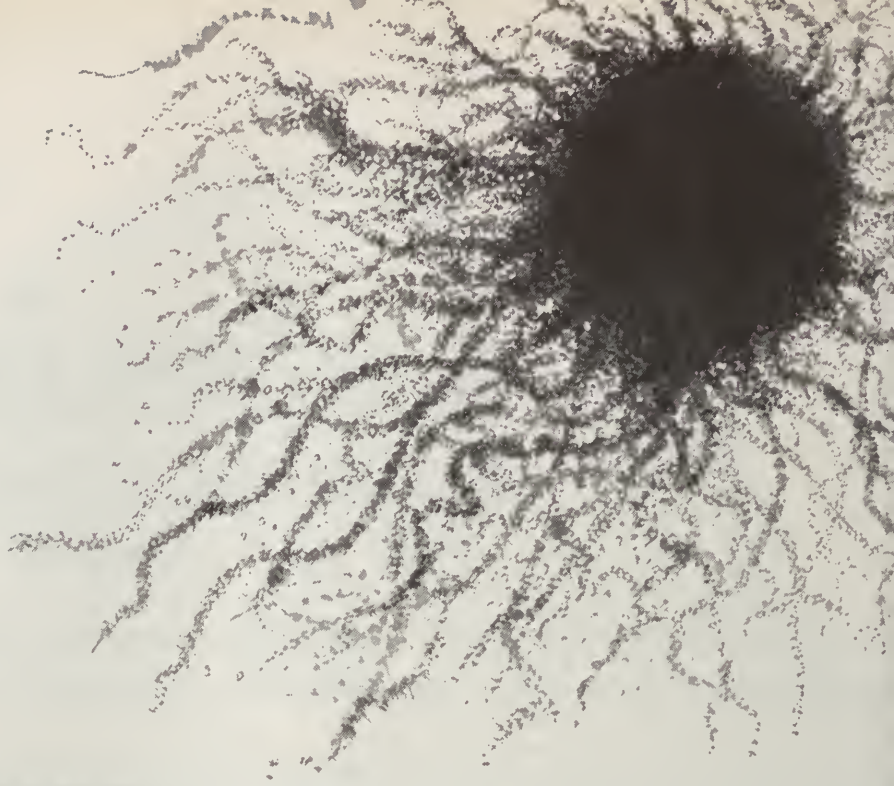
3000 UNIT TABLETS

IN THE TREATMENT OF FUNCTIONAL DYSMENORRHEA AND SELECTED CASES OF PREMATURE LABOR AND 2ND AND 3RD TRIMESTER THREATENED ABORTION

■ LUTREXIN, the non-steroid "uterine relaxing factor" has been found to be useful by many clinicians in controlling abnormal uterine activity.

■ Literature on indications and dosage available on request.

■ No side effects have been reported, even when massive doses (25 tablets per day) were administered.



■ Supplied in bottles of twenty-five 3,000 unit tablets.

(In vivo measurement of Lutrexin on contracting uterine muscle of the guinea pig.)

HYNSON, WESTCOTT & DUNNING, INC. BALTIMORE, MARYLAND 21201

(LTR23)

Corticosteroid therapy week after week.

then antibiotic therapy last week.

and monilial overgrowth this week.

For many patients on long-term corticosteroid therapy, the addition of oral antibiotic therapy may trigger monilial overgrowth in the intestine. When you anticipate such a problem, take action with DECLOSTATIN 300. It combines the broad-spectrum potency of demethylchlortetracycline with the antifungal effectiveness of nystatin—it helps avoid monilial take-over. Experience has shown DECLOSTATIN to be highly useful for many women patients; individual culture studies will show exactly where this usefulness may best be applied.

it doesn't let monilia begin where bacteria end.

Declostatin® 300

Demethylchlortetracycline HCl 300 mg and Nystatin 500,000 units Capsule-Shaped Tablets Lederle

Effectiveness: Because its antibacterial component is DECLOMYCIN® Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose-related. Transient, reversible, nephrogenic diabetes insipidus with excessive thirst and polyuria (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: One tablet b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

CONTENTS:

Medical Advisory Board—Five Year Summary, Ruth W. Baldwin, MD 48

Seat Belts: A Habit To Last A Lifetime, Susan P. Baker, MPH; Charles S. Springate, MD 50

"One of the most tragic—and most common—aspects of traffic fatality investigation is the sight of a dead victim in a smashed automobile, sitting on the belts which could have saved his life."

Vision and Driving, Solomon E. Barr, MD 53

"On today's high-speed highways, the driver is constantly pressed for quick reactions to fleeting visual stimuli. For this reason it is necessary that he be able to see well enough to avoid accidents."

Why the Issue Is Loss Reduction Rather Than Only Crash Prevention, William Haddon, Jr., MD 55

"There is no reason why highway loss-reduction countermeasure priorities must parallel the rank of causes. Traditional emphasis only on crash prevention ignores major opportunities for reducing losses to damaged people and property. A standard method is needed for rating vehicles' occupant protection considering limits set by physics and body force tolerances."

The Alcoholic Driver: Can We Cope With A Menace? Maxwell N. Weisman, MD 61

"The excessive use of alcohol contributes to half of all motor vehicle accidents, and alcoholics and other problem drinkers, who constitute but a small minority of the general population, account for a very large part of the overall problem."

Sex, William K. Keller, MD 64

"It seems odd that we physicians, the preventers, the healers, would do so little about a preventable phenomenon—traffic accidents—that kills about 60,000 men, women, and children each year, and injures about 4½ million."

RADIATION EXPOSURE SURVEY

Last month a national house-to-house interview survey was begun to study and evaluate exposure to diagnostic and therpeutic X-radiation. The survey will continue through October.

During the study, radiological practitioners and facilities will be visited to obtain more complete information on X-ray procedures and treatment reported by the household participants. The purpose of this study is to collect data to evaluate the effectiveness of programs in order to improve X-ray practice and reduce unnecessary exposure.

The study is being conducted by the Bureau of Radiological Health of USPHS and the National Center for Health Statistics.

TRIP TO SWITZERLAND

The Faculty-sponsored trip to Switzerland has been planned for October 11 through 18, 1970. Final details have not been completed, but information will be mailed as soon as possible to those who are interested.

MEDICAID MEETINGS SET

The State Department of Health and Mental Hygiene has established a Vendor Relations Review Team. The Team will assist vendors in eliminating delays in payment for services.

Regional meetings have been scheduled and physicians or members of their staff may attend any of the sessions. A complete listing of locations and dates is available at the Faculty office.

LEGISLATIVE ROUNDUP

Look for the last issue of The Assemblyman for 1970. It contains a complete roundup of the legislation adopted at the recently completed session of the General Assembly.

It contains data on legislation sponsored but not enacted into law. These latter issues will probably be raised again when the 1971 session convenes.

ANNUAL MEETING POSTMORTEM

Figures for the 1970 Annual Meeting indicate that attendance was about the same as in 1969. Weather,

ANNUAL MEETING POSTMORTEM (cont'd)

the early date of the this year's meeting, as well as conflicts with other local and national meetings apparently tended to restrict attendance.

MEDICARE REJECTIONS

Hospitals and Nursing Homes throughout the State have begun to experience rejections (after the fact) of payment for care rendered to Medicare beneficiaries.

The determinations are based upon the claim that skilled care was not required based on the patient's condition.

The Faculty's officers met with Hospital Council executives to discuss a proposed course of action. Initially, an audience is being requested with the Maryland Congressional delegation to discuss this and related problems.

As indicated by President Henry A. Briele, MD, the federal government is attempting to "put on the brakes" because of soaring Medicare costs. This is all at the expense of the doctor, hospital, and patient, who is the final sufferer, he indicated.

PEER REVIEW ACTIVITY

With the adoption of a Bylaw amendment by the House of Delegates, the ad hoc Peer Review Committee was officially established. This committee has been charged with the development of guidelines for use by third party payors, physicians, hospital utilization review committees, and others. Its recommendations will be forthcoming in the near future.

SEMIANNUAL SESSION

The Faculty's Semiannual Session, September 10, 11, 12, is being held at the Hotel Hershey, Hershey, Pa. Hotel reservation requests should be sent directly to the hotel as soon as possible.

The girth control pill

Tepanil® Ten-tab®
(continuous release form)

(diethylpropion hydrochloride)

works on the appetite not on the 'nerves'

When girth gets out of control, TEPANIL can provide sound support for the weight control program you recommend. TEPANIL reduces the appetite—patients enjoy food but eat less. Weight loss is significant—gradual—yet there is a relatively low incidence of CNS stimulation.

Contraindications: Concurrently with MAO inhibitors, in patients hypersensitive to this drug; in emotionally unstable patients susceptible to drug abuse.

Warning: Although generally safer than the amphetamines, use with great caution in patients with severe hypertension or severe cardiovascular disease. Do not use during first trimester of pregnancy unless potential benefits outweigh potential risks.

Adverse Reactions: Rarely severe enough to require discontinuation of therapy, unpleasant symptoms with diethylpropion hydrochloride have been reported to occur in relatively low incidence. As is characteristic of sympathomimetic agents, it may occasionally cause CNS effects such as insomnia, nervousness, dizziness, anxiety, and jitteriness. In contrast, CNS depression has been reported. In a few epileptic, an increase in convulsive episodes has been reported. Sympathomimetic cardiovascular effects reported include ones such as tachycardia, precordial pain, arrhythmia, palpitation, and increased blood pressure. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride; this was an isolated experience, which has not been reported by others. Allergic phenomena reported include such conditions as rash, urticaria, ecchymosis, and erythema. Gastrointestinal effects such as diarrhea, constipation, nausea, vomiting, and abdominal discomfort have been reported. Specific reports on the hematopoietic system include two each of bone marrow depression, agranulocytosis, and leukopenia. A variety of miscellaneous adverse reactions have been reported by physicians. These include complaints such as dry mouth, headache, dyspnea, menstrual upset, hair loss, muscle pain, decreased libido, dysuria, and polyuria.

Convenience of two dosage forms: TEPANIL Ten-tab tablets: One 75 mg. tablet daily, swallowed whole, in midmorning (10 a.m.); TEPANIL: One 25 mg. tablet three times daily, one hour before meals. If desired, an additional tablet may be given in midevening to overcome night hunger. Use in children under 12 years of age is not recommended.

THE NATIONAL DRUG COMPANY
DIVISION OF RICHARDSON-MERRELL INC
PHILADELPHIA, PENNSYLVANIA 1914

Frederick County Medical Society

Ernest A. Dettbarn, MD
Journal Representative

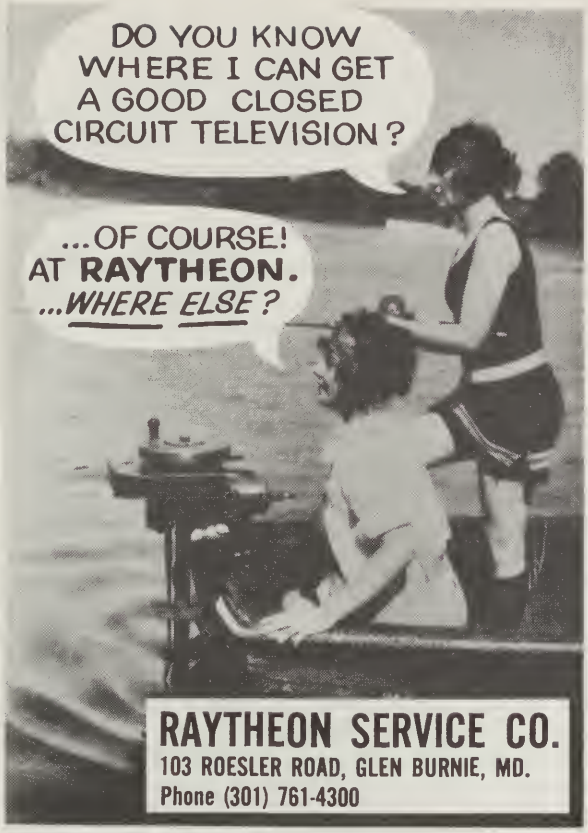
The February meeting of the Frederick County Medical Society, held at the Fredericktown Inn (following the specialty of the house—lobster tails stuffed with crabmeat), was devoted to formulating goals for the coming year.

Traditionally, the meetings have focused upon medical education of the members with guest speakers bringing the knowledge of their specialties to the group. Although recognizing the importance of continuing medical education, the members present were in general agreement that the local Frederick Memorial Hospital Postgraduate Program serves so well in this respect that the component society should direct its goals more in the direction of community-related programs. With this in mind, the following commitments were made:

The members of the society decided to become more actively involved in supporting the program of the American Red Cross Blood Program by pledging blood donations from individual members and lending any other necessary support on an ongoing basis.

The society's president, A. M. Powell, Jr., MD, informed the members present of a request by the Frederick County Ambulance and Rescue Service for one of the physicians to serve as a member of the Board of Directors of that organization. R. R. Roberts, MD, an orthopedic surgeon, was elected to this office from the membership. To lend support to this work, a special committee was named with Dr. Roberts as chairman, and John Harvey, MD, orthopedic surgeon; George Smith, MD, internist; and Thurman Mott, MD, psychiatrist and chief of staff of Frederick Memorial Hospital, as committee members.

A Physician Procurement Committee was established by the society consisting of George Smith, MD, chairman, and Frank Damazo, MD, Rex Martin, MD, Robert Pilgram, MD, and A. A. Pearre, Sr., MD. The purpose of this committee will be to work with various communities in the county to obtain the services of physicians. A committee was established at the February meeting with John Harvey, MD, as chairman, to work in cooperation with the Physician Procurement Committee, but especially to study the use of present facilities and innovations which may improve health care in Frederick County.



The past two or three years have seen a marked increase in schools introducing contact sports in their athletic programs. With the increased number of students participating in these athletic events, and the increased responsibility placed upon the limited number of physicians in the county, it was decided to make this one of the major focal areas of the society, and to make every effort through the society representative to the School Health Council, Charles Wright, MD, to work on guidelines.

Recognizing the need for continued service to the community, the society considered future programs concerned with environmental health, drug abuse, alcoholism, and family planning.

The members of the Frederick County Medical Society joined in mourning the passing of one of their respected colleagues and a past president of the society, Melvin E. Lea, MD. Although known mainly for his work as a general surgeon, he was also held in highest regard in the county for his work in many community activities. His passing represents a great loss to Frederick County.

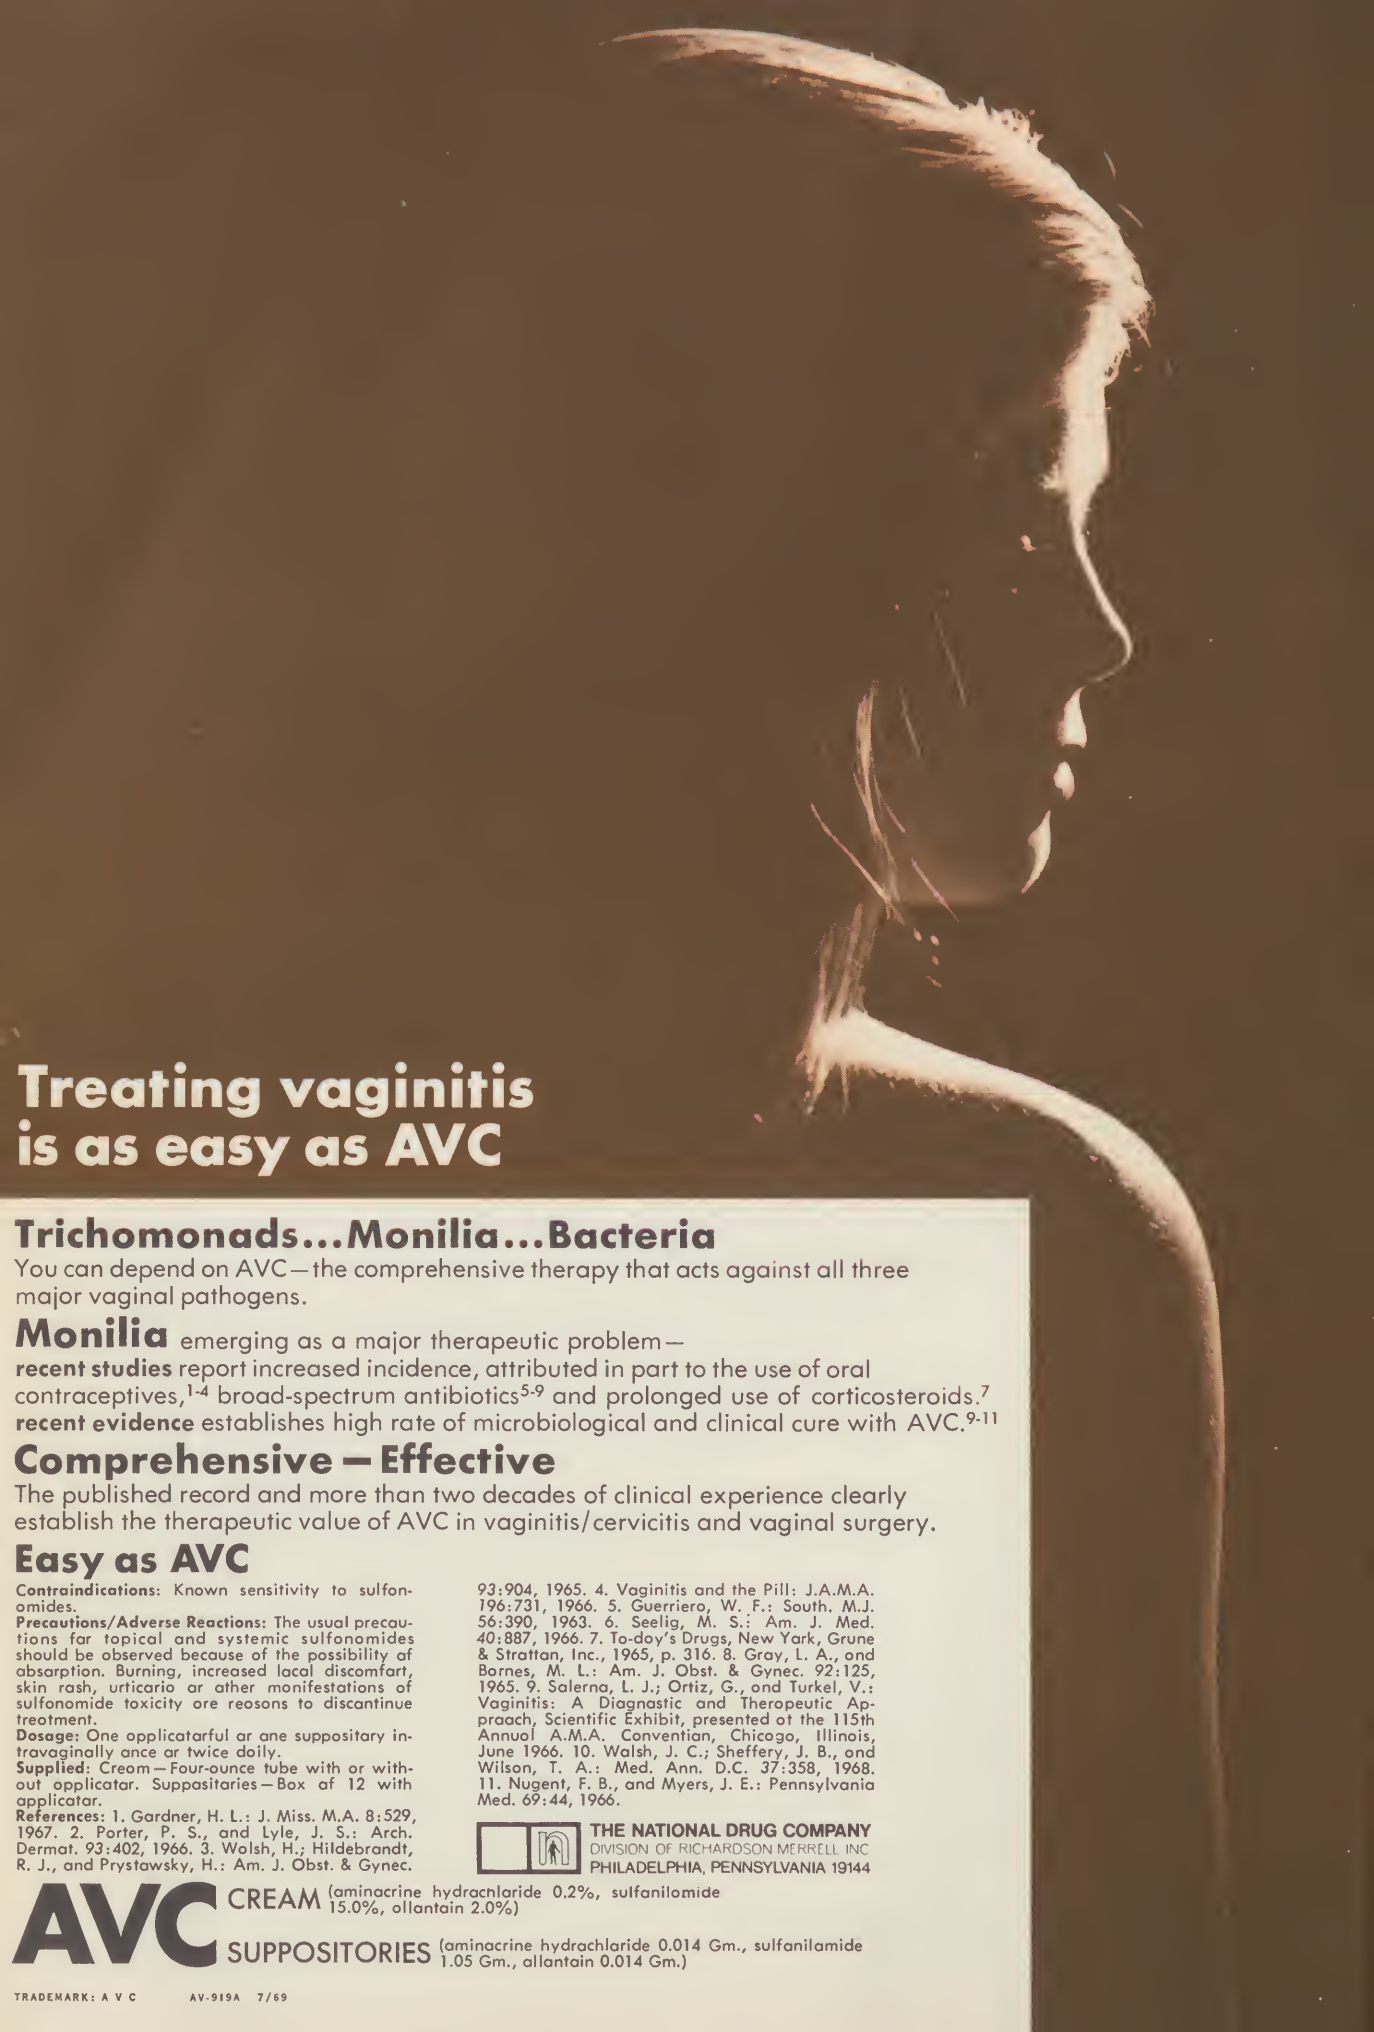
"Making Good Impressions Through Good Impressions"

Painful night leg cramps...

unwelcome bedfellow for any patient– including those with arthritis, diabetes or PVD



One thing patients can sleep without, particularly patients with chronic disease conditions such as arthritis, diabetes or PVD, is painful night leg cramps. Although seldom the presenting complaint, night leg cramps can tie your patients up in painful knots. Now, just one tablet of QUINAMM at bedtime can usually bring an end to shattered sleep and needless suffering. Your patients will sleep restfully—gratefully—with QUINAMM, specific therapy to prevent painful night leg cramps.

Prescribing Information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Precautions/Adverse Reactions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

THE NATIONAL DRUG COMPANY
DIVISION OF RICHARDSON-MERRELL INC.

Quinamm™
(quinine sulfate 260 mg., ominophylline 195 mg.)

Specific therapy for night leg cramps

Treating vaginitis is as easy as AVC

Trichomonads...Monilia...Bacteria

You can depend on AVC—the comprehensive therapy that acts against all three major vaginal pathogens.

Monilia emerging as a major therapeutic problem—
recent studies report increased incidence, attributed in part to the use of oral contraceptives,[1-4] broad-spectrum antibiotics[5-9] and prolonged use of corticosteroids.[7]
recent evidence establishes high rate of microbiological and clinical cure with AVC.[9-11]

Comprehensive—Effective

The published record and more than two decades of clinical experience clearly establish the therapeutic value of AVC in vaginitis/cervicitis and vaginal surgery.

Easy as AVC

Contraindications: Known sensitivity to sulfonomides.
Precautions/Adverse Reactions: The usual precautions for topical and systemic sulfonomides should be observed because of the possibility of absorption. Burning, increased local discomfort, skin rash, urticario or other monifestations of sulfonomide toxicity ore reosons to discontinue treotment.
Dosage: One opplicatorful or one suppositary intravaginally once or twice doily.
Supplied: Creom—Four-ounce tube with or without opplicotor. Suppasitaries—Box of 12 with applicatar.

in active stages of moderate to severe rheumatoid arthritis,

What more can you

after you've tried

rheumatoid spondylitis, and osteoarthritis of the hip

do for these patients?

salicylates and rest

INDOCIN®

(INDOMETHACIN | MSD)

helps relieve pain, fever,
swelling, and tenderness

Please see new prescribing information on following page.

REVISED PRESCRIBING INFORMATION

IMPORTANT NOTE: INDOCIN (Indomethacin, MSD) cannot be considered a simple analgesic and should not be used in conditions other than those recommended under Indications. The drug should not be prescribed for children because safe conditions for use have not been established.

General Adverse Effects: Because of the high potency of the drug and the variability of its potential to cause adverse reactions, the following are strongly recommended: 1) the lowest possible effective dose for the individual patient should be prescribed. Increased dosage tends to increase adverse effects, particularly in doses over 150-200 mg/day, without corresponding clinical benefits; and 2) careful instructions to, and observations of, the individual patients are essential to the prevention of serious and irreversible, including fatal, adverse reactions, especially in the aging patient.

Indications: Symptomatic relief of adult rheumatoid and degenerative joint disease unresponsive to adequate trial of salicylates and other measures of established value, such as appropriate rest. Has been found effective in active stages of: 1) moderate to severe rheumatoid arthritis including acute flares of chronic disease, 2) moderate to severe rheumatoid (ankylosing) spondylitis, and 3) moderate to severe degenerative joint disease of the hip (osteoarthritis of the hip). Has been found effective in relieving pain and reducing fever, swelling, and tenderness in acute gouty arthritis in selected patients. May enable reduction of steroid dosage in patients receiving steroids for the more severe forms of rheumatoid arthritis; in such instances the steroid dosage should be reduced slowly and the patients followed very closely for any possible adverse effects.

Contraindications: Children 14 years of age and under; pregnant women and nursing mothers; active gastrointestinal lesions or history of recurrent gastrointestinal lesions; allergy to aspirin and indomethacin.

Warnings: *Gastrointestinal Effects:* Because of the occurrence and, at times, severity of gastrointestinal reactions, be continuously alert for any sign or symptom signaling a possible gastrointestinal reaction. The risks of continuing therapy with INDOCIN in the face of such symptoms must be weighed against the possible benefits to the individual patient. Gastrointestinal effects may be reduced by giving the drug immediately after meals, with food, or with antacids. Use greater care in aging patients.
Ocular Effects: Corneal deposits and retinal disturbances, including those of the macula, have been observed in some patients on prolonged therapy. Discontinue therapy if such changes are observed. Ophthalmologic examination at periodic intervals is desirable in patients on prolonged therapy.
Central Nervous System Effects: INDOCIN (Indomethacin, MSD) may aggravate psychiatric disturbances, epilepsy, and parkinsonism, and should be used with considerable caution in patients with these conditions. If severe CNS reactions develop, discontinue the drug.

Precautions: Blurred vision may be a significant symptom that warrants a thorough ophthalmologic examination. Patients should be cautioned about engaging in activities requiring mental alertness and motor coordination, as driving a car. Headache which persists despite dosage reduction requires complete cessation of the drug. May mask the usual signs and symptoms of infection; therefore, the physician must be continually on the alert for this and should use the drug with extra care in the presence of existing controlled infection. After the acute phase of the disease is under control, an attempt to reduce the daily dose should be made repeatedly until the patient is off entirely.

Adverse Reactions: *Gastrointestinal Reactions:* Single or multiple ulcerations of the esophagus, stomach, duodenum, or small intestine, including perforation and hemorrhage, with fatalities in some instances; gastrointestinal bleeding without obvious ulcer formation; perforation of preexisting sigmoid lesions (diverticulum, carcinoma, etc.); rarely, increased abdominal pain in ulcerative colitis patients or development of ulcerative colitis and regional ileitis; gastritis, which may persist after the cessation of the drug; nausea, vomiting, anorexia, epigastric distress, abdominal pain, and diarrhea.
Eye Reactions: Corneal deposits and retinal disturbances, including those of the macula, have been observed on prolonged therapy; blurring of vision.
Hepatic Reactions: Rarely, toxic hepatitis and jaundice, including some fatal cases.
Hematologic Reactions: Aplastic anemia, hemolytic anemia, bone marrow depression, agranulocytosis, leukopenia, and thrombocytopenic purpura. Since some patients manifest anemia secondary to obvious or occult gastrointestinal bleeding, appropriate blood determinations are recommended.
Hypersensitivity Reactions: Acute respiratory distress, including dyspnea and asthma; angiitis; pruritus; urticaria; angioedema; skin rashes.
Ear Reactions: Hearing disturbances, deafness, tinnitus.
Central Nervous System Reactions: Psychotic episodes, depersonalization, depression, coma, convulsions, peripheral neuropathy, drowsiness, mental confusion, lightheadedness, dizziness, headache.
Cardiovascular-Renal Reactions: Edema, elevation of blood pressure, hematuria.
Dermatologic Reactions: Loss of hair, erythema nodosum.
Miscellaneous: Rarely, vaginal bleeding, hyperglycemia, glycosuria, ulcerative stomatitis, and epistaxis.

Supplied: Capsules containing 25 mg indomethacin each, in bottles of 100 and 1000; capsules containing 50 mg indomethacin each, in bottles of 100.

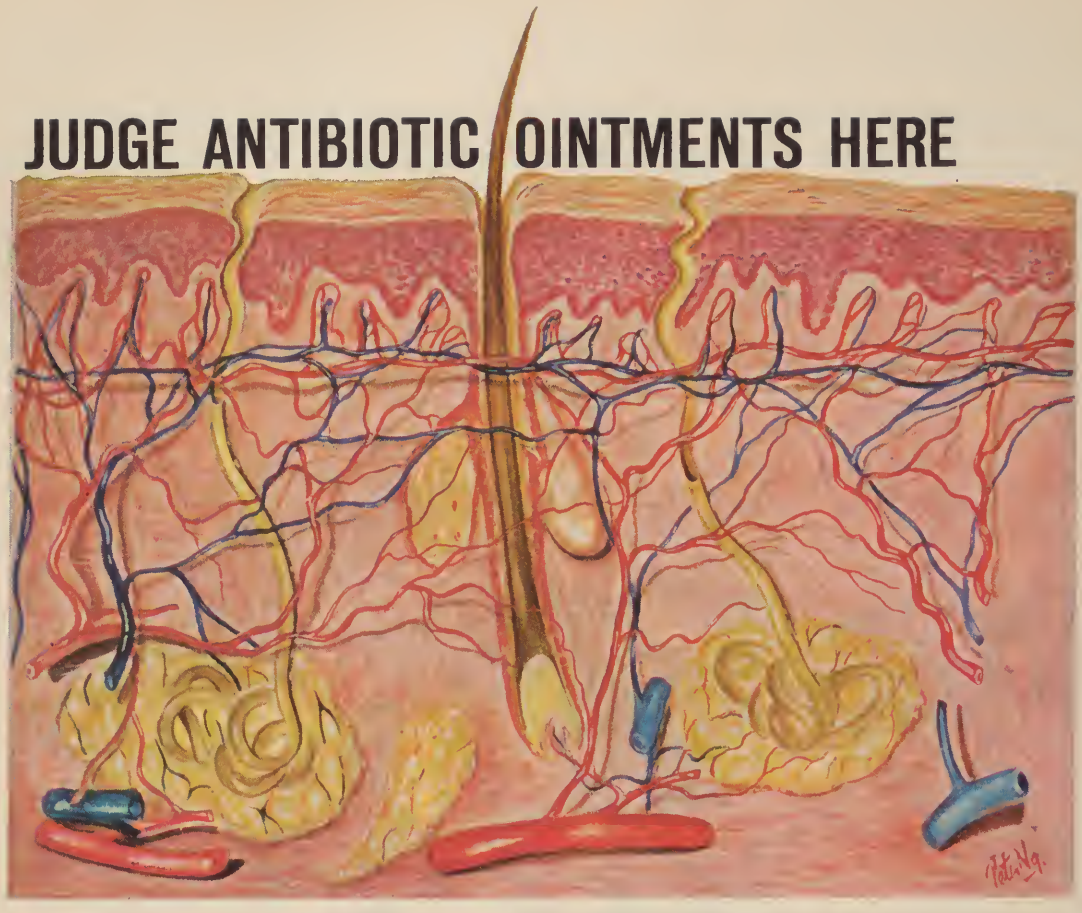
"Well, Dr. Cunningham! I was just telling Herbert I should talk to you about my allergy. First my nose starts to tickle and..."



You know the rest of the story. Sneezing. Watery eyes. Rosy nose. And for prompt relief of these symptoms, here's Novahistine® LP. These continuous-release tablets have a vasoconstrictor-antihistamine formulation that begins working in minutes, then continues to provide relief for hours. Even when nasal congestion is due to repeated allergic episodes, two Novahistine LP tablets, morning and evening, let most patients breathe freely all day and all night. Use with caution in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result.

Novahistine® LP decongestant

(Each tablet contains 25 mg. of phenylephrine hydrochloride and 4 mg. of chlorpheniramine maleate.)

DOW THE DOW CHEMICAL COMPANY Rx Pharmaceuticals Indianapolis

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

optional therapy

THE mudranes®

All Mudranes are bronchodilator-mucolytic in action, and are indicated for symptomatic relief of bronchial asthma, emphysema, bronchiectasis and chronic bronchitis. **MUDRANE tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **Iodide side-effects:** May cause nausea. Very long use may cause goiter. Discontinue if symptoms of iodism develop. **Iodide contraindications:** Tuberculosis; pregnancy (to protect the fetus against possible depression of thyroid activity). **MUDRANE-2 tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline. **Iodide side-effects and contraindications are listed above. MUDRANE GG tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **MUDRANE GG-2 tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions:** Those for aminophylline. **MUDRANE GG Elixir.** Each teaspoonful (5 cc) contains 26 mg. glyceryl guaiacolate; 20 mg. theophylline; 5.4 mg. phenobarbital (Warning: may be habit-forming); 4 mg. ephedrine HCl. **Dosage:** Children, 1 cc for each 10 lbs. of body weight; one teaspoonful (5 cc) for a 50 lb. child. Dose may be repeated 3 or 4 times a day. Adult, one tablespoonful, 4 times daily. All doses should be followed with ½ to full glass of water. **Precautions:** See those listed above for Mudrane GG tablets.

MUDRANE—original formula
First choice

MUDRANE-2
When ephedrine is too exciting or is contraindicated

MUDRANE GG
During pregnancy or when K.I. is contraindicated or not tolerated

MUDRANE GG-2
A counterpart for Mudrane-2

MUDRANE GG ELIXIR
For pediatric use or where liquids are preferred

Clinical specimens available to physicians.

veins, and ventral or diaphragmatic hernias.[1-3]

you are considering weight reduction, consider

Preludin®
phenmetrazine hydrochloride
Endurets®
prolonged-action tablets

Often effective

Controlled studies in a general patient population have shown that when Preludin is used with diet, the rate of weight loss exceeds that obtained by placebo and diet.

Long acting

Slow, even release of the active principle usually suppresses appetite continuously for about 12 hours.

Once-a-day dosage

One Endurets tablet after breakfast. It helps reduce weight and costs, conveniently.

For contraindications, warning, precautions, and adverse reactions, please see the full prescribing information.
It is summarized on this page.

Where there's no will there's a therapeutic way.

•Among persons 20% or more overweight as compared with median weight for persons of like height and sex.

1. Kannel, W.B., *et al.*: *Circulation* 35:734, 1967.
2. Thomas, H.E., Jr., *et al.*: *Med. Times* 95:1099, 1967.
3. Albrink, M.J., In: Beeson, P.B. & McDermott, W. (eds.): *Cecil-Loeb Textbook of Medicine*, ed. 12, Phila.: W.B. Saunders Co., 1967.

Preludin®
phenmetrazine hydrochloride

Preludin is indicated only as an anorexigenic agent in the treatment of obesity. It may be used in simple obesity and in obesity complicated by diabetes, moderate hypertension (see Precautions), or pregnancy (see Warning).

Contraindications: Severe coronary artery disease, hyperthyroidism, severe hypertension, nervous instability, and agitated prepsychotic states. Do not use with other CNS stimulants, including MAO inhibitors.

Warning: Do not use during the first trimester of pregnancy unless potential benefits outweigh possible risks. There have been clinical reports of congenital malformation, but causal relationship has not been proved. Animal teratogenic studies have been inconclusive.

Precautions: Use with caution in moderate hypertension and cardiac decompensation. Cases involving abuse of or dependence on phenmetrazine hydrochloride have been reported. In general, these cases were characterized by excessive consumption of the drug for its central stimulant effect, and have resulted in a psychotic illness manifested by restlessness, mood or behavior changes, hallucinations or delusions. Do not exceed recommended dosage.

Adverse Reactions: Dryness or unpleasant taste in the mouth, urticaria, overstimulation, insomnia, urinary frequency or nocturia, dizziness, nausea, or headache.

Dosage: One 25 mg. tablet b.i.d. or t.i.d. Or one 75 mg. Endurets tablet a day, taken by mid-morning.

Availability: Pink, square, scored tablets of 25 mg. for b.i.d. or t.i.d. administration, in bottles of 100 and 1000.

Pink, round Endurets® prolonged-action tablets of 75 mg. for once-a-day administration, in bottles of 100 and 1000.

call me "Achro® V"

Every pharmacist knows ACHRO® V stands for ACHROMYCIN® V

Contraindications: Hypersensitivity to tetracycline.
Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.
Precautions: Nonsusceptible organisms may overgrow; treat superinfection appropriately. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).
Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity reactions*—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage. Upon adverse reaction, stop medication and treat appropriately.

Maryland Association of Medical Assistants

The Maryland Association of Medical Assistants held its tenth anniversary meeting on April 4, 1970 at the Holiday Inn in downtown Baltimore.

The annual meeting began at 10:00 AM with registration. Following the business meeting, "Case In Point", a film presented by the Wyeth Company, was shown. The film deals with the numerous medical-legal problems that confront medical assistants and physicians in their daily routine of medical practice.

After the luncheon break, Russell S. Fisher, MD, President of the Medical and Chirurgical Faculty, delivered the welcoming address. Then, Mrs. Ruth Dize, President of the American Association of Medical Assistants, presented the membership with the "Value of Certification". Following Mrs. Dize's address, Raymond M. Atkins, MD, advisor to the Maryland Association of Medical Assistants, introduced William DeMario, MD, Assistant Dean at Duke University in Durham, North Carolina. Dr. DeMario spoke on the advancement of the paramedical centers in hospitals and clinics.

At 3:00 PM, the results of the elections for the new state officers were announced. Coffee was then served and door prizes were distributed.

Ronald N. Kornblum, MD, addressed the gathering and presented the "Green Rebellion", which deals with the startling abuse of drugs. Dr. Kornblum showed slides which illustrated many postmortem findings of the effects of an overdose of drugs. Dr. Kornblum is an Assistant Medical Examiner for the State of Maryland.

The gala evening began at 7:00 PM with cocktails, followed by a banquet at 8:00 PM. Dr. Russell S. Fisher was the Master of Ceremonies for the evening. Rev. Thomas Subock, a Methodist minister, gave the invocation. Following dinner, Mrs. Ruth Dize and Mrs. Nell Chaney, Past-president of MAMA, installed the newly-elected officers.

On Sunday, April 5, 1970, at the Holiday Inn, a brunch was held courtesy of Raymond K. Tongue & Co. The drawing was held for the raffle, and then a tour of the U.S.S. Constellation was taken.

The week of festivities highlighted and initiated the start of Medical Assistants Week, proclaimed by Governor Mandel for April 6-12.

The association participated in Medical Assistants Week by helping with the exhibits, coffee booth, and health evaluation tests at the Alcazar during the Medical and Chirurgical Faculty of Maryland's Annual Meeting April 1-3, 1970.

Synthroid®
(sodium levothyroxine)

Indications: SYNTHROID (sodium levothyroxine) is specific replacement therapy for diminished or absent thyroid function resulting from primary or secondary atrophy of the gland, congenital defect, surgery, excessive radiation, or antithyroid drugs. Indications for SYNTHROID (sodium levothyroxine) **Tablets** include myxedema, hypothyroidism without myxedema, hypothyroidism in pregnancy, pediatric and geriatric hypothyroidism, hypopituitary hypothyroidism, simple (non-toxic) goiter, and reproductive disorders associated with hypothyroidism. SYNTHROID (sodium levothyroxine) **Injection** is indicated in myxedematous coma and other thyroid dysfunctions where rapid replacement of the hormone is required. When a patient does not respond to oral therapy, SYNTHROID (sodium levothyroxine) injection may be administered intravenously to avoid any question of poor absorption by either the oral or the intramuscular route.

Precautions: As with other thyroid preparations, an overdosage may cause diarrhea or cramps, nervousness, tremors, tachycardia, vomiting and continued weight loss. These effects may begin after four or five days or may not become apparent for one to three weeks. Patients receiving the drug should be observed closely for signs of thyrotoxicosis. If indications of overdosage appear, discontinue medication for 2-6 days, then resume at a lower dosage level. In patients with diabetes mellitus, careful observations should be made for changes in insulin or other antidiabetic drug dosage requirements. If hypothyroidism is accompanied by adrenal insufficiency, as Addison's Disease (chronic subcortical insufficiency), Simmonds's Disease (panhypopituitarism) or Cushing's syndrome (hyperadrenalism), these dysfunctions must be corrected prior to and during SYNTHROID (sodium levothyroxine) administration. The drug should be administered with caution to patients with cardiovascular disease; development of chest pains or other aggravations of cardiovascular disease requires a reduction in dosage.

Contraindications: Thyrotoxicosis, acute myocardial infarction.

Side effects: The effects of SYNTHROID (sodium levothyroxine) therapy are slow in being manifested. Side effects, when they do occur, are secondary to increased rates of body metabolism: sweating, heart palpitations with or without pain, leg cramps, and weight loss. Diarrhea, vomiting, and nervousness have also been observed. Myxedematous patients with heart disease have died from abrupt increases in dosage of thyroid drugs. Careful observation of the patient during the beginning of any thyroid therapy will alert the physician to any untoward effects.

In most cases with side effects, a reduction in dosage followed by a more gradual adjustment upward will result in a more accurate indication of the patient's dosage requirements without the appearance of side effects.

Dosage and Administration: The activity of a 0.1 mg. SYNTHROID (sodium levothyroxine) TABLET is equivalent to approximately one grain thyroid, U.S.P. Administer SYNTHROID tablets as a single daily dose, preferably after breakfast. In hypothyroidism without myxedema, the usual initial adult dose is 0.1 mg. daily, and may be increased by 0.1 mg. every 30 days until proper metabolic balance is attained. Clinical evaluation should be made monthly and PBI measurements about every 90 days. Final maintenance dosage will usually range from 0.2-0.4 mg. daily. In adult myxedema, starting dose should be 0.025 mg. daily. The dose may be increased to 0.05 mg. after two weeks and to 0.1 mg. at the end of a second two weeks. The daily dose may be further increased at two-month intervals by 0.1 mg. until the optimum maintenance dose is reached (0.1-1.0 mg. daily).

Supplied: Tablets: 0.025 mg., 0.05 mg., 0.1 mg., 0.15 mg., 0.2 mg., 0.3 mg., 0.5 mg., scored and color-coded, in bottles of 100 and 500. Injection: 500 mcg. lyophilized active ingredient and 10 mg. of Mannitol, N.F., in 10 ml. single-dose vial, with 5 ml. vial of Sodium Chloride Injection, U.S.P., as a diluent.

SYNTHROID (sodium levothyroxine) INJECTION may be administered intravenously utilizing 200-400 mcg. of a solution containing 100 mcg. per ml. If significant improvement is not shown the following day, a repeat injection of 100-200 mcg. may be given.

Morton Grove, Illinois 60053

Doctor Watson exposes a double agent

Foon the Embankment. Two figures emerge into silhouette against a haed street lamp. The flare of a match reveals the profile of Sherlock Hones. As he lights his calabash, his companion speaks:

"BJove, Holmes, that amazing intuition of yours has proved right agn. What we're looking for is a single entity. I thought we were deing with several others—even twins. But now—I'd say we've unvered a double agent."

'Tl me more, Watson, and be quick about it!"

(Wson withdraws a folded paper from inside his greatcoat, and reas aloud from it):

'T key to the whole cypher is SYNTHROID (sodium levothyrone)"...

'Sh! Watson, not so loud! You'll alert our quarry."

Wson continues): "A single entity that serves two functions."

'Amaster stroke, Watson."

'Flow along, Holmes. In the neighborhood of 95% of the circulatng hyroid hormone is levothyroxine—T_4 as you call it. T_4 is bound o yroxine-binding proteins in the serum. It becomes available only gradually to tissue cells—as free thyroxine."

"Is that why there's such a smooth, predictable response, Watson?"

"Quite! With agent T_4, SYNTHROID, the chances of a precipitous rise in metabolic rate are lessened."

"But how does 'free' thyroxine fit into the picture?"

"Well, Holmes, you might call it the tissue thyroid hormone—because 'free' thyroxine (that is, thyroxine not bound to protein) is active at the tissue level. It is gradually released from thyroxine-binding proteins. Each daily dose of SYNTHROID is mostly bound to thyroid-binding proteins, and slowly released as 'free' thyroxine—the form in which it is metabolically active."

"Magnificent, Watson! So protein-bound thyroxine is the major form of circulating thyroid hormone, and it is released as 'free' thyroxine. And that's why SYNTHROID is able to simulate the normal process so artfully. Q.E.D."

"Not so fast, Holmes. SYNTHROID works for the *physician*, too. Because its dosage is more precisely controllable, and because response is so smooth and predictable, the *doctor* gets fewer phone calls in the wee hours from agitated patients. Both parties get more sleep!"

"Comforting, my dear doctor, to know that SYNTHROID, the 'single agent,' cleverly does the job of two."

Restaurants of Distinction in Maryland

THE MONTH IN WASHINGTON

The Nixon Administration called for limitations on medicare and medicaid reimbursements to physicians and hospitals.

Health, Education and Welfare Under Secretary John G. Veneman told the Senate Finance Committee that because of rising costs "it is now time to make some fundamental changes in the law which governs medicare and medicaid reimbursements". He said the reasonable cost and reasonable charge criteria in the medicare law had not provided opportunity for major cost-control efforts.

"We need an incentive system of institutional reimbursement and we need changes in the law that will help control the increases in the amount that the medicare program will recognize in the charges of individual practitioners . . .

"I believe . . . that the law should be changed so as to limit further the rate at which increases in physicians' fees would be recognized by medicare. The basic difficulty at present is that despite the improvements which have been made in applying reasonable charge guidelines, the best that can be done under present law is to introduce a lag in the recognition of fee increases. . . .

"Customary and prevailing charges under the program and the fees recognized by the carriers under comparable circumstances in their own business reflect, in the long run and after a suitable lag in recognition of fee increases, whatever physicians choose to charge the public generally in a market where growing demand is pressing increasingly on the limited supply of health personnel.

"Reliance on Blue Shield fee schedules as the limiting factor in medicare reimbursement, as suggested in the Senate Finance Committee staff report, however, would not seem to us to have long-run viability. Tying payments under a program as large as medicare to Blue Shield schedules would surely exert a major upward pressure on those schedules. . . .

"We believe that it is necessary to move in the direction of an approach to reasonable charge reimbursement that ties recognition of fee increases to an index.

"Under such an approach, allowable charges recognized for medicare would next year be generally limited to either presently recognized charges or to a new prevailing level set at the 75th percentile of 1969 average customary charges for a given service in an area. In the future the prevailing charge screen would move upward only in proportion to increases in an index made up of pertinent portions of wage and price indices. Under such an approach, recognition of fee increases would continue, but only in relation to things that are happening in other parts of the economy and that have a bearing on the physician's cost of doing business."

The American Medical Association said that any proposal for further limitations on physicians' fees under the government programs would be unwise.

"For all practical purposes, a freeze on physicians' fees under the two federal programs has been in effect for more than a year and has proven to be ineffective," Gerald D. Dorman, MD, AMA President, said. "The costs of the program have continued to rise in spite of the freeze.

"Physicians are disturbed by threats of additional federal controls.

"Burdening these busy doctors with more red tape and restricting payments to unrealistically low levels may drive them away from participating in Medicare and Medicaid. Then the government will have discriminated against many people who need medical care. . . .

"The national interests would be better served if everyone joined with the American Medical Association in its efforts to provide more physicians."

In a later report, The Nixon Administration proposed that prepaid, closed-panel group practice health care be authorized under both medicare and medicaid.

The American Medical Association recommended to the House Ways and Means Committee a new medicaid plan utilizing existing private health insurance mechanisms to replace the present program of health care assistance for the medically indigent.

Robert H. Finch, secretary of Health, Education and Welfare, said Congress would be asked to approve legislation authorizing "health maintenance contracts guaranteeing health services for the elderly and the

poor at a single fixed annual rate for each person served.

"In the case of medicare," Finch said, "the patient will be entitled, under such a contract, to all of the usual medicare services plus preventive services. The contract price will be negotiated in advance at an amount less than the Social Security Administration presently pays for conventional medicare benefits in the locality.

"Similarly, under medicaid we are seeking authority for the states to offer to the poor the option of securing services under such health maintenance contracts. We propose to work with the individual states toward the modification of their present programs in this regard and to encourage their use of the experimental authority previously mentioned for the testing of a variety of different contractual arrangements.

"The cornerstone of this new option in federal health purchasing will be the opportunity for consumers to choose between alternatives. The ultimate goal will be to give every beneficiary of these programs a choice between obtaining services from a health maintenance organization or arranging for them in the usual way from individual physicians and hospitals. He will have the choice of withdrawing from enrollment in a health maintenance organization if he finds the service unsatisfactory. The government will have the choice of entering into arrangements with individual health maintenance organizations, subject to special standards including assurance that every contractor will serve persons of high medical risk as well as the healthy."

Earlier, HEW Under Secretary John G. Veneman told the House committee that it was planned to call the new approach under medicare Part C—to provide all services covered under Parts A and B "plus preventive services." He estimated a saving of about $15 per person, but some committee members were skeptical that more services could be provided at less cost.

Both Finch and Veneman made it clear that one of the main objectives is a fundamental change in the nation's system of health care delivery. They said states would ask to repeal existing laws restricting prepaid group practice. They said that future federal medicaid funds might be made contingent on states eliminating "legal barriers to all forms of health delivery organizations".

"Let me conclude by saying that our broad objective is to frame an effective and reasonable approach to meet the health needs of the American people," Veneman said. "Obviously, the federal government by itself cannot redirect the total health delivery system. We can, however, do our best to make sure that the vast expenditures of the federal government in the health care industry are used in a way that will contribute to the evolution of an improved, more effective, more economical system to deliver health care to our people. To the extent we are successful, we will be delivering the maximum benefit from the public funds entrusted to us. But what is equally important, we will be providing valuable support for improvement of the total health care system, public and private. In that way, we will be helping to improve the delivery of health services for all the American people."

Russell B. Roth, MD, Speaker of the AMA House of Delegates, told the House committee that medicaid "has demonstrated some weaknesses which badly need correction".

A new program, he said, should● "provide the Congress with a basis for reasonable predictable costs;● ease the burden on the states; ● assure total implementation;● and while maintaining a level of quality, insure that the costs of the program remain within the range of acceptability."

The program recommended by the AMA had these features:

1. Each eligible person (or family) would receive a certificate to be redeemed by a qualified health insurance company offering a health insurance policy or contract of certain basic health benefits such as hospitalization, medical care, preventive care, and diagnostic and outpatient care.

2. The premium cost for such policy or contract would be assumed by the federal government from its general revenue fund.

3. The states, freed from the expense of financing the basic costs of health care for their indigent and medically indigent residents, could provide supplementary benefits. These might include, for example, skilled nursing home care and dental services.

4. The determination that an insurance policy or contract, and the company offering same, are "qualified" would be made by a state agency which customarily has that authority. However, changes in the scope of benefits, and guidelines or standards to be used by the insurance departments in judging the company and the plan it offers, would be established by a national board appointed by the President.

5. All individuals and families below a certain level of income would be eligible to participate. A simple determination of eligibility could be made by the appropriate federal agency on the basis of income, or an even more refined criterion could be used such as tax liability. The program could require marginal needy families to participate in the expense of the premium charge by paying a small part of it, varying such participation in direct proportion to this tax liability.

6. For the lower income family there would be no deductibles and no co-insurance features.

7. To insure a high level of quality and to prevent cost escalation, the program would provide for a system of "peer review," organized and conducted in a manner to assure its success.

As to those services and charges which are within the purview of the medical profession, appropriate medical societies would be given the task of establishing a peer review mechanism that would, among other things, review individual charges and services wherever performed; review hospital and skilled nursing home admissions as to their medical necessity, and stays in hospitals and skilled nursing homes as to their continued medical necessity; and review the need for the professional services provided in the institution.

In the case of fraud or other clear intentional and gross misconduct, the peer review committee would be expected to bring charges before the appropriate licensing body.

To assist peer review committees in becoming established and in their operation, the program should provide for federal participation in the cost incurred in developing the program and its operation. To assure participation by members of the profession, those who serve on peer review committees should be held harmless from any actions or claims based on their decisions as to the necessity or quality of the services provided, or the reasonableness of the charge.

In the event that a peer review committee is not established by the appropriate medical society within a reasonable time, or although established is not functioning, the Secretary of Health, Education and Welfare, in consultation with the medical society, would be empowered to appoint a committee to so act.

The American Medical Association supports the Nixon Administration's air pollution control bill (S. 3466) which would give the Department of Health, Education and Welfare power to set air quality standards for the nation.

The legislation also would provide for intensified research in air pollution and for tough enforcement procedures on the national air purity standards.

The AMA also supports accompanying legislation providing for expanded research on ways to cut auto exhaust pollution and for pollution control standards for watercraft and airplanes.

James M. Blake, MD, a member of the AMA's Council on Legislation, told the Senate Subcommittee on Air and Water Pollution:

"For too long we have taken for granted the atmosphere, one of our natural resources; it is time now to look upon this resource as one on which the survival of man depends. . . .

"In recent years, the country has awakened to the need to control air pollution. Yet, more and more, our air becomes polluted and hazards to health increase. We must take stronger action to reverse this direction—stronger action than we have taken in the past. . . .

"It is imperative, that all elements of our society join to overcome the increasing pollution of our atmosphere. Measures which a few years ago were deemed adequate to meet the needs simply have not achieved the desired goals. New steps must be taken if we are to make any substantial headway in alleviating the problem. Accordingly, we believe that it is now necessary to provide for additional pollution controls and to make the essential financial commitment. . . ."

States must report to the Internal Revenue Service each year on total payments to providers of medicaid services under new regulations issued by the Department of Health, Education and Welfare.

Each year, states will file Internal Revenue Service Forms 1096 and 1099 giving amounts paid to physicians, dentists, pharmacists, opticians, nursing homes, hospitals and other individuals and institutions that provide service to medicaid patients.

States will be required to identify each individual provider of service by Social Security number, and partnerships and corporations by an employer identification number.

States also must establish procedures for verifying with recipients whether services billed by providers were actually received. Such verification may be made by spot checking.

President Nixon approved a $65 million increase in the Veterans Administration medical care budget to be used to improve services for wounded Vietnam war veterans.

An increase of $50 million was authorized in the VA's medical budget for fiscal 1971 and $15 million for the remainder of this fiscal year. Nixon acted after reviewing a study by Veterans Administrator Donald E. Johnson of the scope of the veterans' medical care program and the increasing difficulties it has faced in providing hospital and clinical care.

"To those who have been injured in the service of the United States we owe a special obligation," Nixon said. "I am determined that no American serviceman returning with injuries from

Vietnam will fail to receive the immediate and total medical care he requires."

The $15 million supplemental appropriation would be spent in April, May and June to clear up the excessive backlog in Vietnam veterans' dental claims and to improve the staffing of specialized medical programs, especially the spinal cord injury centers and coronary intensive care units.

The additional funds also would be used to carry out plans for taking hemodialysis units into the homes of veterans suffering from serious kidney ailments and to help meet increased costs of needed drugs and medicines.

The VA's budget request already submitted to Congress for the 1971 fiscal year beginning in July totals $1.5 billion.

The new request for $50 million will bring the budget for fiscal 1971 to $210 million more than the approved appropriation for fiscal 1970.

* * *

The National Society for Medical Research said that no valid finding on the effects of marijuana can be expected for another two to seven years.

Science Research Society said that part of the difficulty is that there is no standard yardstick for evaluating marijuana in scientific studies. The basic weed from which marijuana is made can vary from plant to plant and from country to country, the group said.

But the Society cautioned: "Until scientifically proven results are obtained, it appears as foolhardy to smoke marijuana as it would be to take any other unknown drug or chemical agent just for kicks."

The Society said two projects are now going on in an effort to achieve scientific standardization in marijuana studies.

The federal government has negotiated new agreements with France and Turkey aimed at stemming the flow of heroin into this country.

But, in announcing the agreements, John E. Ingersoll, director of the Bureau of Narcotics and Dangerous Drugs, said the government's long-range objective in dealing with the problem is "to induce the medical community to find adequate substitutes" for opium, from which heroin is derived.

Ingersoll admitted the U.S. was asking a great deal of Turkey, where opium has been grown for centuries.

"But when you've got over 900 deaths last year from heroin, 224 of them teenagers, in one city, I think you've got a right to start hollering," he said. "There have been three deaths a day from heroin in New York city this year. It is the major cause of death for 18- to 35-year-olds in New York city."

Ingersoll estimated 80% of the 2.5 to 3 tons of heroin smuggled into the U.S. annually comes from the poppy fields of Turkey via the clandestine laboratories of France where the opium is refined into heroin.

The agreement with Turkey includes a $3 million loan approved by the agency for international development in 1968. The money is to be used partly to help the Turks substitute crops like sugar beets and sorghum for opium and partly to equip and train a 460-man narcotics police force.

The U.S. agreement with France calls for frequent meetings in Washington, D.C. and in Paris to exchange information on such matters as the known drug traffickers and trafficking routes.

France also has assigned a force of 300 police to fight narcotics internally and 30 police to combat it at the international level. Ingersoll's narcotics bureau will increase its manpower in France next year and also will engage in a crosstraining program with French police.

* * *

Congress finally approved an appropriation bill acceptable to President Nixon to provide funds for the Health, Education and Welfare and the Labor departments for the 1970 fiscal year which began last July 1.

The two departments operated under stopgap Congressional resolutions while Nixon and Congress battled over how much money the bill should provide. The President vetoed the first bill passed by Congress as inflationary, since it exceeded his budget by $1.2 billion. Congress sustained the veto but still refused to accept Nixon's original fund-cutting proposals for the two departments. The second bill totaled $19.4 billion, $680 million more than the President requested. But Nixon accepted the compromise amount when Congress added a provision authorizing him to withhold 2% of the funds.

The second bill contained $176 million in Hill-Burton hospital funds, compared with $258 million in the vetoed measure. The appropriation for health facilities, educational research, and libraries was cut from $149 million to $126 million.

Health manpower direct loan funds remained the same, $234.5 million, but an administration spokesman said that $15.5 million would probably be withheld. Other announced plans to withhold funds in the health field included:

—$6 million from $108.8 million for air pollution control;

—$6.3 million from $35.5 million for construction of community mental health centers;

—$6.3 million from $360.3 million for mental health programs;

—$8.7 million from $146.3 million for the National Institute of Arthritis and Metabolic Diseases;

—$5.7 million from $107 million for the National Institute of Neurological Diseases and Stroke;

—$1.3 million from $103.7 million for the National Institute of Allergies and Infectious Diseases;

—$10.3 million from $164.6 million for the National Institute of General Medical Sciences;

—$7 million from $76.7 million for general research and services.

* * *

The Food and Drug Administration announced plans to require that a warning leaflet be included in every package of birth control pills.

"I have come to the conclusion that the information being supplied to the patients in the case of the oral contraceptive is insufficient and that re-evaluation of our present policies is in order," FDA Commissioner Charles C. Edwards, MD, told the Senate Monopoly Subcommittee at one of its public hearings on side-effects of birth control pills.

A proposed draft of the warning leaflet states that "there is a definite association between blood-clotting disorders and the use of the oral contraceptive."

It emphasizes the importance of reporting any side-effects to "your doctor."

"All of the oral contraceptive pills are highly effective for preventing pregnancy, when taken according to the approved directions," the proposed draft says. "Your doctor has taken your medical history and has given you a careful physical examination. He has discussed with you the risks of oral contraceptives and has decided that you can take this drug safely.

"This leaflet is your reminder of what your doctor has told you. Keep it handy and talk to him if you are experiencing any of the conditions you find described . . .

"Besides women who have or who have had blood clots, other women who should not use oral contraceptives are those who have serious liver disease, cancer of the breast or certain other cancers and vaginal bleeding of unknown cause.

"If you have heart or kidney disease, asthma, high blood pressure, diabetes, epilepsy, fibroids of the uterus, migraine headaches, or if you have any problems with mental depression, your doctor has indicated you need special supervision while taking oral contraceptives.

"Even if you don't have special problems, he will want to see you regularly to check your blood pressure, examine your breasts and make certain other tests."

An American Medical Association spokesman questioned the tone of the language of the FDA's draft of the leaflet.

"In general, it is a good idea to have a package insert but the text of the FDA proposal raises serious questions about the relationship between doctor and patient," he said. "It puts the full responsibility on the physician, but oral contraceptives generally are prescribed more as a convenience to a patient than as a medication. The patient must share responsibility both morally and legally and be alerted to her own responsibility."

The FDA now requires that pharmaceutical manufacturers only warn physicians and pharmacists of side-effects and possible hazards of taking birth control pills. Makers of the drugs were given an opportunity to comment on the proposed leaflet after its publication in the Federal Register.

* * *

Identical bills designed to increase the number of physicians and allied health personnel in family medicine have been introduced in the House and Senate. Sponsors of the legislation say that prospects are good for Congressional approval this year.

The legislation would authorize $50 million for the current fiscal year of 1971, $75 million for fiscal 1972, and $100 million for each of the next fiscal years for grants to medical schools and hospitals. The grants would help medical schools and hospitals establish departments and programs in family practice of medicine and encourage the training of allied health personnel in that field of medicine.

Sen. Ralph W. Yarborough (D.-Tex.) sponsored the legislation (S. 3418) in the Senate. Thirty-one other senators, both Democrats and Republicans, were co-signers of the bill. Yarborough is chairman of both the Senate Labor and Public Welfare Committee and the Subcommittee on Health which will handle the legislation. An aide said the senator would schedule hearings and that he was confident the Senate would approve the legislation this year.

Rep. Fred B. Rooney (D.-Pa.) introduced the bill (H.R. 15793)in the House first this year. Rooney is a member of the House Interstate and Foreign Commerce Committee which will handle the legislation on that side of the capitol. Several other House members also introduced it separately.

Aides to both Yarborough and Rooney said they had worked with representatives of the American Academy of General Practice in drafting the legislation.

ARTHUR E. COCCO, MD
Journal Representative

Baltimore City Medical Society

Board of Directors Meet

The Board of Directors of the Baltimore City Medical Society met on Tuesday, March 10, 1970 at 4:30 PM at 1211 Cathedral Street, Baltimore. The meeting was called to order by John N. Classen, MD, and the minutes of the February 10, 1970 meeting were approved.

The first item on the agenda was a review of resolutions to be proposed at the Med-Chi House of Delegates meeting during Annual Meeting in April. Resolution 1A/70 submitted on August 12 by 31 members of the Baltimore City Medical Society concerns the provision of ambulatory diagnostic benefits by insurance carriers either in the hospital or in private physician offices. After some discussion, the Board recommended that this resolution, as amended by the Med-Chi Reference Committee, be adopted.

Resolution 2A/70 submitted on February 24 by 31 members of the Baltimore City Medical Society urges the Medical and Chirurgical Faculty to recommend to the Boards of Trustees and Medical Executive Committees of all Maryland hospitals that action be taken to discontinue the sale of cigarettes and tobacco in their respective institutions. The Board agreed that the implementation of such a resolution would indeed be difficult but, nonetheless, in view of evidence offered with regard to cigarette smoking and health, such a resolution seems justifiable.

The Board also recommended adoption of Resolution 3A/70, introduced by the Garrett County Medical Society, endorsing the purpose and intent of Article 43-B establishing the comprehensive Drug Abuse Control and Rehabilitation Act and urging implementation and execution of the provisions thereof.

As is required by the Bylaws, a joint meeting of the Board of Directors and the Baltimore City Medical Society Delegates and Alternates to the Medical and Chirurgical Faculty House of Delegates was then held. The Board's opinions and views were expressed by Dr. Classen to those present.

The regular meeting of the Board was then resumed and a request for endorsement of the Maryland Artificial Kidney Treatment Fund was considered. After discussion, the Board decided that recognition of this fund could not be granted until more information concerning the organization was obtained.

A letter of intent to be sent to the Office of Economic Opportunity concerning the MUND project was presented to the Board for its suggestions and endorsement. The letter was directed to Robert L. Kalinowski, MD, Deputy Associate Director for Health Affairs, Office of Economic Opportunity, Washington, D.C. The important context of this letter is as follows:

"It is the intention of the MUND Neighborhood Development Corporation (NDC) in what is expected will be a joint venture with the University of Maryland School of Medicine, Provident Hospital and/or Mercy Hospital and/or Maryland General Hospital, and private physicians serving the areas, to apply to OEO for a planning and operational grant to provide comprehensive health care for the residents of MUND.

"The essential elements of this proposal are:

"1. MUND'S NDC will represent a typical inner-city area of 19,000 people and would plan and operate with its joint venturers, the MUND Comprehensive Health Care Center. Responsibility for authority, direction, and control of the Center would rest with MUND'S Neighborhood Development Corporation.

"2. The University of Maryland School of Medicine, a regional resource, in conjunction with NDC, would serve as a coordinating point in planning, staffing, and operating the Center.

"3. Private physicians serving the area would participate in planning, staffing, and operating the Center.

"4. Provident Hospital, Maryland General Hospital, and Mercy Hospital would assist in planning, and one or more of them would help to operate the Center and to provide back-up services.

"5. The Greater Baltimore Committee and/or other qualified consultants would be engaged to serve as catalysts and to assist in the planning.

"6. A task force of representatives of the above professional institutions, private doctors serving the area, MUND-NDC, and consultants would be established to plan a system, organization, and facility to deliver comprehensive health care to MUND residents.

"A comprehensive health service center located in MUND would insure adequate health services to 19,000 people not now available to them. Good health is essential if citizens in the MUND community are to adequately participate in the planning and implementation of programs designed to lift the total community out of the morass of urban poverty. Indeed, a key objective of the total program is the establishment and operation of the MUND Comprehensive Health Care Center."

After some discussion, the Board decided that the opinions of the practicing physicians in the MUND area would be solicited and the Board would base its recommendation on these opinions.

Requests for waiver of dues from Jesus M. Lopez, MD, who, at present, is working for the World Health Organization in Latin America, and Leon Gordis, MD, who is presently a visiting professor in Israel, were approved.

The Board voted to recommend that the Medical and Chirurgical Faculty grant Emeritus Membership to William S. Stone, MD. Dr. Stone has been a member of the Society since 1955 and served as Dean of the University of Maryland School of Medicine until 1969.

The Board chose to honor a request from the U.S. Treasury Department to enclose a flyer in a forthcoming mailing concerning the purchase of U. S. Savings Bonds.

A request from the National Foundation-March of Dimes to enclose a letter with the next general mailing of the Society was denied. It was the Board's opinion that this might set a precedent and the Society would be deluged with similar requests all of which could not be honored.

The next item on the agenda was the consideration of a request from the Medical and Chirurgical Faculty of the State of Maryland as to whether the Baltimore City Medical Society wishes to investigate charges against two members of the Society concerning narcotics violations. The Board decided that certainly it felt the Society has an obligation to investigate matters concerned with morals and ethics of its membership, but that since the limitations of such an investigation are not clearly defined, the Society should query the state medical society further as to its exact position in such an investigation.

The Board concurred in the suggestion that the Bylaws be amended making the Finance Committee a standing committee with specific responsibilities, but that final authority for all financial matters of the Society should rest with the Board.

No new business was presented and the meeting was adjourned at 6:00 PM.

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the MARYLAND STATE MEDICAL JOURNAL.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the JOURNAL and are not returned. The JOURNAL is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, MARYLAND STATE MEDICAL JOURNAL, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text, and kept to a minimum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the JOURNAL. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number, the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with JOURNAL style.

Statements made or opinions expressed by any contributor in any article or feature published in the JOURNAL are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the MARYLAND STATE MEDICAL JOURNAL is protected by copyright and may not be reproduced without the written permission of both the author and the JOURNAL.

Campbell's Soups... wide variety...for limited appetites

Many people lose interest in food as they grow older. Some of them are fussy eaters—with only a few favorite foods. Others become indifferent to foods—because planning and preparing meals becomes a chore. Here Campbell's Soups can help —for these four very good reasons:

Appeal With a variety of tastes, textures, aromas, and colors, Campbell's Soups can add interest and appetite appeal. And they're easy to eat—ingredients are tender, bite-size. Even patients on special diets will find soups they can enjoy among the more than 50 different varieties available.

Nourishment Campbell's Soups contain selected meats and sea foods, best garden vegetables—carefully processed to help retain their natural flavors and nutritive values.

Convenience Within 4 minutes a bowl of delicious soup is heated and ready to eat.

Economy Campbell's Soups are inexpensive—an important consideration to those whose budgets are limited.

Recommend Campbell's Soups . . . and, of course, enjoy them yourself. Remember, *there's a soup for almost every patient and diet . . . and for every meal.*

This is the "answering service" your patient takes home with her..

included in her Compackage™ sample of

Helpful booklet saves unnecessary phone calls—Reminds her of your directions concerning her oral contraceptive schedule . . . contains supportive instructions for "Sunday starting" . . . explains in simple language many aspects of "the pill."

Packaging helps her stay on schedule—The Ovulen Compack®, with each tablet designated by day and week of cycle, shows at a glance the last day on which a tablet was taken.

Each white Ovulen tablet contains 1 mg. ethynodiol diacetate and 0.1 mg. mestranol. Each pink tablet is a placebo, containing no active ingredients.

Ovulen®-21
Ovulen®-28
"the convenient one"

NOTE: For the budget-minded woman specify Triopak™, a three-month supply (1 Compack and 2 Refills).

Actions—Ovulen acts to prevent ovulation by inhibiting the output of gonadotropins from the pituitary gland. Ovulen depresses the output of both the follicle-stimulating hormone (FSH) and the luteinizing hormone (LH).

Special note: Oral contraceptives have been marketed in the United States since 1960. Reported pregnancy rates vary from product to product. The effectiveness of the sequential products appears to be somewhat lower than that of the combination products. Both types provide almost completely effective contraception.

An increased risk of thromboembolic disease associated with the use of hormonal contraceptives has now been shown in studies conducted in both Great Britain and the United States. Other risks, such as those of elevated blood pressure, liver disease and reduced tolerance to carbohydrates, have not been quantitated with precision.

Long-term administration of both natural and synthetic estrogens in subprimate animal species in multiples of the human dose increases the frequency of some animal carcinomas. These data cannot be transposed directly to man. The possible carcinogenicity due to the estrogens can be neither affirmed nor refuted at this time. Close clinical surveillance of all women taking oral contraceptives must be continued.

Indication—Ovulen is indicated for oral contraception.

Contraindications—Patients with thrombophlebitis, thromboembolic disorders, cerebral apoplexy or a past history of these conditions, markedly impaired liver function, known or suspected carcinoma of the breast, known or suspected estrogen-dependent neoplasia and undiagnosed abnormal genital bleeding.

Warnings—The physician should be alert to the earliest manifestations of thrombotic disorders (thrombophlebitis, cerebrovascular disorders, pulmonary embolism and retinal thrombosis). Should any of these occur or be suspected the drug should be discontinued immediately.

Retrospective studies of morbidity and mortality in Great Britain and studies of morbidity in the United States have shown a statistically significant association between thrombophlebitis and pulmonary embolism and the use of oral contraceptives. There have been three principal studies in Britain[1-3] leading to this conclusion, and one[4] in this country. The estimate of the relative risk of thromboembolism in the study by Vessey and Doll[3] was about sevenfold, while Sartwell and associates[4] in the United States found a relative risk of 4.4, meaning that the users are several times as likely to undergo thromboembolic disease without evident cause as nonusers. The American study also indicated that the risk did not persist after discontinuation of administration, and that it was not enhanced by long-continued administration. The American study was not designed to evaluate a difference between products. However, the study suggested that there might be an increased risk of thromboembolic disease in users of sequential products. This risk cannot be quantitated, and further studies to confirm this finding are desirable. Retrospective studies in Great Britain and the United States have shown a statistically significant association between cerebral thrombosis and embolism and the use of oral contraceptives.

Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions medication should be withdrawn.

Since the safety of Ovulen in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule the possibility of pregnancy should be considered at the time of the first missed period.

A small fraction of the hormonal agents in oral contraceptives has been identified in the milk of mothers receiving these drugs. The long-range effect to the nursing infant cannot be determined at this time.

Precautions—The pretreatment and periodic physical examinations should include special reference to the breasts and pelvic organs, including a Papanicolaou smear since estrogens have been known to produce tumors, some of them malignant, in five species of subprimate animals. Endocrine and possibly liver function tests may be affected by treatment with Ovulen. Therefore, if such tests are abnormal in a patient taking Ovulen, it is recommended that they be repeated after the drug has been withdrawn for two months. Under the influence of progestogen-estrogen preparations preexisting uterine fibromyomas may increase in size. Because these agents may cause some degree of fluid retention, conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. In breakthrough bleeding, and in all cases of irregular bleeding per vaginam, nonfunctional causes should be borne in mind. In undiagnosed bleeding per vaginam adequate diagnostic measures are indicated. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. Any possible influence of prolonged Ovulen therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. A decrease in glucose tolerance has been observed in a significant percentage of patients on oral contraceptives.

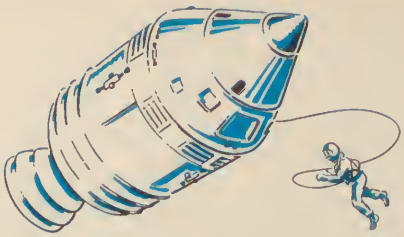
The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving Ovulen therapy. The age of the patient constitutes no absolute limiting factor, although treatment with Ovulen may mask the onset of the climacteric. The pathologist should be advised of Ovulen therapy when relevant specimens are submitted. Susceptible women may experience an increase in blood pressure following administration of contraceptive steroids.

Adverse reactions observed in patients receiving oral contraceptives—A statistically significant association has been demonstrated between use of oral contraceptives and the following serious adverse reactions: thrombophlebitis, pulmonary embolism and cerebral thrombosis.

Although available evidence is suggestive of an association, such a relationship has been neither confirmed nor refuted for the following serious adverse reactions: neuro-ocular lesions, e.g., retinal thrombosis and optic neuritis.

The following adverse reactions are known to occur in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea during and after treatment, edema, chloasma or melasma, breast changes (tenderness, enlargement and secretion), change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately post partum, cholestatic jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals and mental depression.

Although the following adverse reactions have been reported in users of oral contraceptives, an association has been neither confirmed nor refuted: anovulation post treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption and itching.



The following laboratory results may be altered by the use of oral contraceptives: hepatic function: increased sulfobromophthalein retention and other tests; coagulation tests: increase in prothrombin, Factors VII, VIII, IX and X; thyroid function: increase in PBI and butanol extractable protein bound iodine, and decrease in T^3 uptake values; metyrapone test and pregnanediol determination.

SEARLE Where "The Pill" Began 976

G. D. Searle & Co., P. O. Box 5110, Chicago, Illinois 60680

Man in space, now fait accompli, re-emphasizes the importance of Uro-Phosphate therapy. Research into the effect of space travel on the astronaut reveals that weightlessness causes loss of bone calcium. As the bones are required to bear less and less of the weight of the body they lose calcium, increasing the calcium content of the urine. When physical activity is reduced, the acidity of the urine should be adjusted to keep increased calcium in solution . . . . a prophylaxis to prevent kidney or bladder calculi.

Uro-Phosphate®

NOW A SUGAR-COATED TABLET

Each tablet contains: METHENAMINE, 300 mg.; SODIUM ACID PHOSPHATE, 500 mg.

Uro-Phosphate gives comfort and protection when inactivity causes discomfort in the urinary function. It keeps calcium in solution, preventing calculi; it maintains clear, acid, sterile urine; it encourages complete voiding and lessens frequency when residual urine is present.

Uro-Phosphate contains sodium acid phosphate, a natural urinary acidifier. This component is fortified with methenamine which is inert until it reaches the acid urinary bladder. In this environment it releases a mild antiseptic keeping the urine sterile.

Uro-Phosphate is safe for continuous use. There are no contra-indications other than acidosis. It can be given in sufficient amount to keep the urine clear, acid and sterile. A heavy sugar coating protects its potency.

Dosage:

For protection of the inactive patient 1 or 2 tablets every 4 to 6 hours is usually sufficient to keep the urine clear, acid and sterile.

2 tablets on retiring will keep residual urine acid and sterile, contributing to comfort and rest.

A clinical supply will be sent to physicians and hospitals on request.

WILLIAM P. POYTHRESS & COMPANY, INC., RICHMOND, VIRGINIA 23217

Manufacturers of Ethical Pharmaceuticals

Cutting Golf Balls:

Eye Hazard for Kids

Several news reports came into the National Society for the Prevention of Blindness last summer dealing with eye injuries caused by golf balls which explode when youngsters cut them open to see what's inside. The danger is in the liquid core of the ball, which can explode when cut into because it is under pressure of up to 2,500 pounds per square inch.

Adding to this impact force (eight youngsters with "serious eye injuries" from exploding balls were recently reported by a group of Philadelphia ophthalmologists) is the chemical harm which may occur, depending on the ingredient used for the liquid core. The substance used for ball cores varies with the manufacturer, and the list of possible ingredients encountered in reports received by NSPB includes sulfuric acid, barium salts, zinc sulfide, silicone, gelatin, corn syrup, ethylene glycol, lead oxide paste, mineral oil, sodium hydroxide, castor oil and water. Some of the more exotic ingredients reported included wheat germ and fish oil.

A spokesman for one large manufacturer of golf balls said that: "Liquid center golf balls bearing our name utilize only water." He went on to say that water was preferable because, "without any type of additive, it affords consistent reaction on impact and . . . consistency in the product offered to the public." Liquid centers (varying from water to pastes) are now the "preferred" core substance for golf balls, and have been in use since the early 1930's.

Materials and Construction

The U.S. Golf Association has set standards for minimum diameter, maximum weight and maximum velocity of golf balls. They do not "approve" or "recommend" any brands; but manufacturers meeting these standards are allowed to so state in their promotions. The Association does *not* involve itself in any way with the proportions of materials used in ball construction, or with the materials themselves.

A golf ball is composed of four main parts: the core substance (probably liquid) encased in a rubber shell; a rubber-thread winding; the cover, usually of balata, a rubber-like substance from trees in South America, and usually in combination with synthetics; and a finish, which provides gloss and protection.

According to a major manufacturer's sales manual, the liquid center, in a thin-walled seamless rubber shell, has the desirable quality of "immediate response" to the impact of the club, and transmits "all the power" to the winding. The rubber-thread winding must be high quality ("great tensile strength"), the "proper" quantity, and precision wound for maximum "fight back" reaction, distance and speed.

The manual also states, "the less expensive the ball, the less winding . . . the center is larger. . . ."

The Problem

If liquid centers are the most desirable center—for ball performance, and several of the major manufacturers believe water to be the optimum liquid—it would at least eliminate the chemical dangers to the eye if water were used in all balls.

As to the danger of the exploding centers, upon cutting into a ball, it would appear that a major part of the problem may arise from the "less expensive" balls which have larger centers and less rubber-thread winding. A youngster cutting into the ball may cut right through the winding, releasing the liquid. If the winding is thicker, this is less likely, and the youngster will probably just be satisfied with the rubber-thread ball he discovers under the cover.

In any case, NSPB's point is to make the golfing public aware of the danger to curious youngsters. The best bet would be to keep golf balls away from children; and *not* give them old balls to play with. Of course, any child who suffers an eye injury from exploding fluid of a cut-open ball should be taken to an ophthalmologist or other physician promptly. Immediate measures: flush the eye profusely with water.

"Mommy,
I don't feel
so good..."

Young heads and stomachs often can't manage the pace of hurry-up-and-stop for the light... or going up hill, down hill, and around the curve. All too quickly a pleasant drive can become an upsetting trip. *Motion sickness makes children—and their parents—absolutely miserable.*

You can help make young patients better passengers with

BONINE®

(MECLIZINE HCl)

Bonine protects most patients—young or old—against nausea and vomiting up to 24 hours with a single dose. Pleasant-tasting Bonine tablets are chewable. They can be taken anytime, anywhere, without water. In difficult cases, multiple daily doses may be necessary for maximum response.

Precautions: Although the incidence of drowsiness and atropine-like side effects such as dry mouth and blurring of vision is low, the physician should alert the patient to the need for due precautions when engaging in activities where alertness is mandatory. *Use in women of childbearing age:* In weighing potential benefits vs. risk in women of childbearing age, consider the fact that a review of available animal data reveals that meclizine exerts a teratogenic response in the rat. In one study a dose of 50 mg./kg./day (50 times the maximum recommended human dose) produced cleft palate in 2 of 87 fetuses when administered to the rat at critical times during the first 15 days of gestation. At doses of 125 mg./kg./day, meclizine will produce 100% incidence of cleft palate in the rat. At doses of 25 mg./kg./day, decreased calcification of the vertebrae and relative shortening of the limbs were also produced in the rat, but experts disagree as to whether this is a teratogenic response. While available clinical data are inconclusive, scientific experts are of the opinion that this drug may possess a potential for adverse effects on the human fetus. Consequently, consideration should be given to initial use of a nonphenothiazine agent that is not suspected of having a teratogenic potential. In any case, the dosage and duration of treatment should be kept to a minimum.

Supply: 25 mg. scored tablets.

More detailed professional information available on request.

Medical Advisory Board —

In 1947, the Commissioner of Motor Vehicles of the State of Maryland instituted a Medical Advisory Board to evaluate medical conditions which could be a hazard in driving. The Board makes recommendations to the Commissioner, but has no power to act. Questions are referred from courts, license reviewers, letters received or drivers reporting a medical or mental condition which could be hazardous. In the 23 years the Board has been in operation, the Board's judgments have always been supported by the various Commissioners. Reports are obtained from the individual's physicians, hospitals, clinics, employers when indicated, agencies, courts, and schools. When conflicting information has been obtained, the Department also has investigators who, on request, will question neighbors, employers, store personnel, and family.

The reports are reviewed by the Medical Advisory Board members and the individuals may be requested to appear before the Board. This could be because the reports indicate a possible definite hazard or a hazard could exist if the individual did not understand his medical condition in relation to driving or take proper treatment. Records for the past five years indicate that approximately one fourth of the cases are rejected each year. The medical conditions are divided into eight categories according to the type of conditions seen.

"Epilepsy" includes all those cases referred for passing out, blackouts, loss of consciousness or amnesia which are not due to cardiac conditions or hypoglycemia. These applicants or drivers must be seizure free for a minimum of two years, see their physicians regularly and take their medication regularly. Should medication be decreased, then they must go at least six months without driving for each time medication has been decreased. From the chart it is evident that approximately one third are rejected. Many who were rejected one year, with improvement in their conditions, have obtained permission to drive in subsequent years.

In the category of "Mental" are all forms of mental illness from mild to severe psychotic episodes, narcotics users, and individuals who have been found guilty for the second time of driving under the influence of alcohol. Approximately one third were considered a risk. Those who have been guilty the second time of driving under the influence of alcohol must be seen by the license reviewers if the Medical Advisory Board recommendation is favorable. The license reviewers then re-evaluate his driving record and investigative report and may further deny the privilege of driving.

The next largest group seen are the "Diabetics". One tenth of those rejected are primarily the juvenile diabetics who have frequent insulin reactions, have little understanding of their disease, have had accidents or have other complicating conditions. Many of these on reapplying are given a positive recommendation if improvement is shown.

The fourth group are those with "Cardiac Disturbances". One fifth of those rejected have mainly uncompensated cardiac failure or some other severe condition associated with their cardiac disease. It is recommended that an individual not drive for at least six months after a coronary attack.

The group with "Paralytic Conditions" are composed of those with paralysis due to various causes such as stroke, cerebral palsy, polio, etc. If the condition is not a degenerative one and the individual has at least one normal functioning leg and arm, approval is recommended. Those with athetosis, cardiac involvement, arteriosclerosis or mental deterioration are rejected. Of this group, approximately one fifth are rejected. Most of these persons have severe cerebral palsy and athetosis with or without retardation or are stroke patients with mental changes.

Five Year Summary

The sixth group are those with "Atrophy or Degeneration," mainly with neuromuscular conditions. With those individuals who are expected to have exacerbations, much time is expended discussing the privilege of driving while in remission and reporting their exacerbations and not driving until approved. There has been good cooperation with these cases. Less than one third were rejected.

The seventh group is very small, but important—amputees. The amputated limbs may be the result of disease or accidents and, thus, should be evaluated. One fourth were rejected on this basis.

The last group is the "Mentally Retarded". Although some who cannot read have licenses, with the increase in cars on the road and more complex driving conditions, it has been the decision of the Board that those with IQ's under approximately 70 should not drive. This is the only group in which the rejected was the majority, but it is a very small group at present. However, the number has been increasing slightly each year.

In each case an adverse recommendation can, with significant improvement in the individual's medical condition, be reversed. In many cases, suggestions are made to the individuals as to what they should do. It is especially impressed on them to follow their physician's recommendations.

For 23 years, meetings have only been held in the State Department of Motor Vehicles building, but beginning shortly, meetings will be set up in Salisbury, Cumberland and Rockville. This will bring the meeting place closer to the physicians in the area and to the drivers. Additional areas for future meetings are also being planned.

SEAT BELTS:

A Habit To Last A Lifetime

One of the most tragic—and most common—aspects of traffic fatality investigation is the sight of a dead victim in a smashed automobile, sitting on the belts which could have saved his life.

SUSAN P. BAKER, MPH
CHARLES S. SPRINGATE, MD
The Johns Hopkins University
School of Hygiene and Public Health
Office of the Chief Medical Examiner of Maryland
Maryland Medical-Legal Foundation

Safety belts are effective. They can substantially reduce the number of highway deaths and minimize passenger injuries.[1] Nevertheless, most seat belts are not used. Although standard equipment on U.S. automobiles produced since 1964, they are used by only a third of the people who have them.[2] Even though the combined lap and torso restraint has been shown to prevent essentially all fatalities at speeds up to 60 miles per hour,[3] available upper torso restraints are apparently no more likely to be used than lap belts.[2]

Although progress is being made in the development of new protective devices such as air bags, it will be many years before all automobiles have them. Furthermore, seat belts will *still* have to be worn to prevent ejection, and to protect the passenger during rollover. Thus, automobile occupants must somehow be inspired to use those devices which may save their lives in the event of a crash.

We suggest an approach aimed at promoting more general usage of available restraint systems. Emphasis is placed upon restraints for children, in the belief that an intensive effort to protect young people could lead to more widespread use of safety restraints by passengers of all ages. At present, few children receive adequate protection when riding in automobiles. The physician with young patients is in an excellent position to launch an effective program of injury prevention.

In 1968, 180,000 passengers under 15 years of age were injured in highway crashes in the United States, and almost 3,000 were killed. Forty percent of the children who died were less than five years old.[4] These statistics reflect the tendency of most parents to allow their children to travel unrestrained, or to place them in car seats which merely provide a place to sit without offering safety.

Most collision injuries occur when unrestrained occupants are hurled by their momentum against whatever lies in their path. Depending upon the direction of impact and the sequence of events, a passenger may collide with any part of the vehicle, another passenger, the road, or objects outside the car. Furthermore, as the first of our case studies suggests, children thrown about in a collision may increase the hazard to other passengers.

Recent Maryland Cases

Case 1. In a head-on collision, a five year old who had been sitting in the back seat of the car was thrown forward with such force that his body bent the front seat. The front seat became detached and the mother, who was driving, was killed; the child sustained a crushed hip and ruptured spleen. Appropriate restraints probably would have prevented both the mother's death and the child's injuries.

Case 2. A station wagon making a left turn was struck by another car, causing the right rear door to open. A two-year-old child who had been seated near the door was thrown out onto the road. Death was due to a lacerated liver. The other four passengers were not thrown out, and received only minor injuries.

Case 3. An eight-year-old boy sustained head injuries and a broken leg when his father's car was hit on the left side—even though he was sitting in the right front seat. He died four days later without regaining consciousness. A seat belt could have kept him from striking the surfaces which injured him.

Studies of Collisions Involving Children

A medical-engineering team of accident investigators at UCLA evaluated 46 collisions in which 82 of the passengers were less than 13 years old.[5] Sixty-three of the children were injured, seven fatally. Each injury was analyzed as to its severity, the

mechanism of its production, and preventive measures which would have been effective. The team observed that infants held in the arms of their mothers were occupying the worst possible location if a collision occurred. The mother's forward motion in a frontal impact tends to crush the infant between her body and the interior of the car. Even a mother using a seat belt would find it difficult to hold onto a baby whose effective weight is greatly increased in a collision, as the baby moves toward the area of impact.[6]

In general, the UCLA group found that children younger than five were injured more severely than children in the 5 to 12 age group. Placing unrestrained children in the rear seat proved to be ineffective in preventing injuries. Because of their relatively high center of gravity, younger children tend to be "top heavy". This factor, as well as their lighter weight, causes them to become airborne more easily than older children and adults. As a result, young children riding in the back seat received more severe injuries than older children. (Iskrandt and Joliet noted that there is a year-by-year decrease from age one to four in the death rate associated with nonpedestrian motor vehicle accidents.[7] We believe that this phenomenon could be associated with the gradual decrease in the child's tendency to become airborne in a collision.)

Recommended Restraints

The age-associated changes in children's center of gravity, height-weight relationships, collision kinematic behavior, and patterns of injury make it necessary to recommend different types of restraints as a child grows. The UCLA group described the advantages and disadvantages of a number of devices. On the basis of collision injury evaluation and experimental collision research, they suggest the following:

1) From birth until four to six months, the infant should ride in a car bed which is securely anchored with seat belts and lies parallel to the long axis of the vehicle. The child should be placed in the bed with his feet toward the front of the car. His safety during a rollover would be increased if the car bed were covered with webbing or a net.

2) Between the ages of four and six months, most children can graduate to an upper- and lower-torso harness of net or wide webbing. The harness is placed on the child before he is placed in the car, then attached to webbing which is looped vertically around the back seat and attached to the rear deck and floor pan. The child can sit or lie down, or stand to stretch his legs.

3) Between 12 and 18 months, a child can start using an *acceptable* car seat. Such a seat either is attached directly to the structure of a car, or employs the standard lap belt to anchor the seat or restrain the child while he is sitting on it; wide bands of webbing or a molded plastic shield keep the upper torso from jackknifing at the time of collision. Unfortunately, the most commonly used children's car seats are hooked over the front seat with U-shaped tubes, or are inadequately attached to the seats of the car with straps or tubes. Such children's seats often come loose in a crash and provide no protection against injury. Furthermore, their narrow straps and poorly padded front-bars may actually cause injuries. (Some of the recommended seats can be used by children as young as six to nine months).

4) After the age of three or four (40 to 45 lb), the child may use a standard adult lap belt. Sitting on a *hard* cushion or folded rug will help him to see out of the windows more easily, as well as ensure that the belt will be over the pelvis rather than the abdomen. The adult shoulder-lap belt combination is *not* recommended for children until they are four to five feet tall and have a seated height of 24 to 25 in.

King, Paul, and Spitznagel [8] recommend that children weighing less than 50 lb use special children's restraints as long as possible. They urge development of restraints especially suited for the 5 to 12 year age group, but point out that lap belts do offer good protection from injuries resulting from ejection or striking the interior of the vehicle.

The Physician's Role

Clinicians should be willing to assume an active role in protecting their patients from major health hazards. Since accidents are the leading cause of death in children over a year old, their prevention is surely as important as prevention of the childhood diseases which physicians have brought under control by immunization. Burg, et al,[9] recommend that physicians should actually *prescribe* automotive restraining devices for their young patients.

There are numerous reasons for such a positive approach. In the first place, many parents automatically try to follow their physicians' instructions in matters relating to the health of their children. One study showed that although letters from the Safety Council had no effect, installation of seat belts increased among the families seen by a pediatrician who spent a few moments discussing the subject with parents.[10] Willingness to invest in the safety of their children was further demonstrated by the tendency of parents to buy an expensive car seat in preference to a cheaper one.[11]

Physicians also have an opportunity and a responsibility to advise parents *against* those "restraint" practices which are potentially dangerous. For example, many parents need to be told that a child

traveling in a wooden crib can be badly hurt when thrown against the crib, and that "papoose" style infant seats were not designed for automobile seats.[5] Car seats which hook over the seat back are not safe in a collision, yet their widespread use suggests that most parents are unaware of this.

As a young patient matures, his physician is in a position to suggest the type of restraint which is compatible with his stage of growth, just as he would suggest introduction of new foods or the appropriate immunization schedule. As noted by Burg, et al,[9] if the physician fails to recommend the proper restraint, no one else is likely to do so.

A child who is accustomed to being restrained at an early age is probably more likely to accept restraints as he grows older. Once children are old enough to reason, their acceptance of safety devices may depend upon whether other people in the car are using seat belts. A North Carolina study showed that young adult drivers were the least likely to be using seat belts and that restraints were used by a smaller proportion of females than males.[2] This is particularly unfortunate, since young mothers are in the best position to influence the safety habits of their children. If parents can be persuaded to set a good example by fastening their own seat belts, a second major achievement can be scored, since the motor vehicle death rate for adults is far greater than that for children.

Opposition to Use of Restraints

Since parents themselves often resist the use of seat belts, four of their most frequently expressed fears are given here, followed by factual counter-arguments:

1. "I would rather be 'thrown clear' if I'm in a bad crash." Occupants who are thrown from cars and escape without injury are an exception; ejection is considered the leading cause of death in highway crashes.[1]

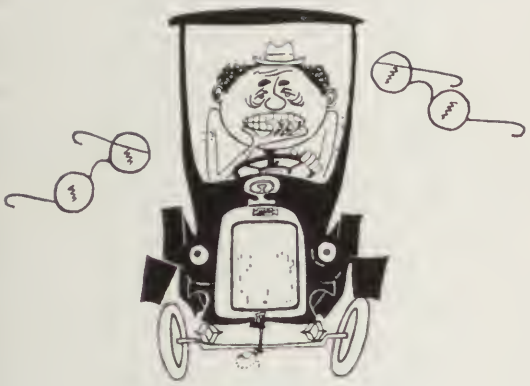
2. "I am afraid of being trapped in a burning car." (Or, "I want to be able to escape if my car goes into a river.") If a crash is of such force that fire results, unrestrained occupants may be too disabled to remove themselves from the car. Seat belts can be released so quickly and easily that an occupant whose safety belt has kept him intact and conscious has the best chance of escaping from a burning or submerged vehicle.

3. "I have heard of people being injured by seat belts." Such injuries are uncommon, and minor when compared to the injuries which would have resulted if no seat belt had been worn. Seat belt injuries are extremely rare when belts are worn correctly—snug and low over the hips. Shoulder straps need a little slack, enough for a hand to be slipped between strap and chest.

4. "Lap belts don't offer enough protection to be worth the bother." In a series of over 8,000 crashes studied in North Carolina, severe injuries were reduced by 36% and *no* fatal injuries were sustained by any of the 985 drivers wearing lap belts.[12] Not worth the bother?

Conclusion

Marked reduction in highway fatalities and injuries can be achieved by: (1) elimination of intoxicated drivers from the highways, (2) continued improvement in vehicular design, and (3) proper use of restraint systems by all automobile occupants. The first goal apparently will not be reached in this country for many years. Continued progress in the second area will help, but only as older vehicles are "retired." The third goal is the best preventive measure currently available to the American public.



However, only one third of all adults are using their belts regularly. Even more appalling is our failure to insist that children be properly restrained. Physicians are in an excellent position to strongly influence their patients' use of seat belts.

This article describes types of restraints recommended for children of various ages. Emphasis by physicians on the use and the proper selection of restraints for children will save lives now and promote use of safety devices by our coming generation of drivers and passengers.

VISION and DRIVING

SOLOMON E. BARR, MD
Assistant Clinical Professor of Medicine
George Washington University
School of Medicine
Subcommittee on Traffic Safety
Medical and Chirurgical Faculty

Vision is almost the only route of sensory input when driving a car. Hearing plays such a minor role that many states allow completely deaf people to drive a private vehicle. On today's high-speed highways the driver is constantly pressed for quick reactions to fleeting visual stimuli. For this reason it is necessary that he be able to see well enough to avoid accidents.

Dynamic visual acuity, or the ability to identify rapidly moving objects, is the visual response most closely correlated with the crash rate.[1] Evidence collected in California [2] revealed that more than half the motor vehicle operators arrested for cutting in had one eye with subnormal acuity. This inquiry also showed that drivers with accident-free records had better vision than those with bad driving records. That good dynamic visual acuity is of vital importance in the proper interpretation of the clues needed for driving a car is indicated by the following data: At 60 miles an hour a car travels 88 feet per second. A driver with normal 20/20 vision has 3.2 seconds to clearly read a five-inch road sign and act upon this information.[3] But as a driver with:

20/30 vision he has only 2.5 seconds
20/40 vision he has only 1.6 seconds
20/50 vision he has only 1.4 seconds
20/60 vision he has only 1.0 seconds
20/100 vision he has only 0.65 of a second [2]

This does not give him much time to read and act upon the information. Because the best possible vision is none too good at the speeds we travel on modern highways, the problems with reduced vision become obvious. Larger signs would obviously also be of help.

On the basis of risk, drivers are frequently divided into classes one, two, and three.[4] Class three includes private motor vehicle operators, and classes one and two various types of commercial and professional operators, such as chauffeurs, bus, and

truck drivers. The standards are higher for these professional drivers than for class three. When evaluating a person's vision for driving, one must remember that a patient may be qualified to drive his private vehicle, but be disqualified for driving a nonprivate one such as a school bus.

Central visual acuity should be 20/40 or better in at least one eye.[5] People with optimally corrected vision of 20/70 or less in the better eye present a serious limitation and should be referred to an ophthalmologist to ascertain if their vision can be corrected. Spectacle correction of 10D or more in the better eye is disqualifying, unless a visual field of 140 degrees can be demonstrated.[4]

Breadth of vision is the ability to recognize objects in the horizontal portion of the visual field. Visual fields are obviously important for safe driving, because a driver must possess some lateral awareness in order to pass vehicles or see cars approaching from the side. Visual fields of 140° or better are considered adequate for most motor vehicle drivers except for the commercial and professional ones.[4, 5] However, the field of usable clear vision decreases as the velocity of forward motion increases. A normal field of vision is reduced to approximately 80° at 40 mph and 40° at 60 mph.[3] Increased use of larger mirrors would be helpful in increasing lateral awareness.

Because of the importance of depth perception, one-eyed drivers and spectacle-corrected aphakic drivers present increased risk of intersectional crashes. After cataract surgery the one-eyed individual, depending on the operated eye, may have a narrow visual field of only 40°.[4] Also these patients may be in advanced years, with increased difficulty with night vision and dynamic visual responses. They require special evaluation. Measurement of reaction time may be important in these older people, and can be done on special equipment at the Bureau of Motor Vehicles. A binocular-aphakic wearing contact lenses usually can drive safely.[4] Patients who have had monocular vision for years have learned to accommodate to this handicap, whereas people with recent loss of one eye have not. Therefore, people with recent or temporary loss of vision in one eye cannot drive, but those with long standing one-eye vision usually can do so.

Night blindness is difficult to measure. However, the presence of corneal opacities and retinopathy may disqualify a person for night driving.[4] Patients requiring pupillary constricting medication, as in the control of chronic glaucoma, also have limitation of night operation. Sunglasses reduce light transmission by 47% to 81%.[3] No one should wear dark glasses at night, and the windshield should not be tinted more than one third of the way from the top.[4] The need for regular bifocals *per se* is not disqualifying for any class of drivers.[4]

Color blindness has been considered as a possible cause of highway accidents. However, most traffic lights have been standardized, and it is doubtful if the usual red-green color blindness is of any importance in the cause of traffic accidents.[5] A completely color-blind individual usually has other deficiencies of his visual apparatus and these may prohibit him from driving.[5]

Until July 1, 1969, Maryland shared with Virginia the dubious distinction of having the poorest standards for visual acuity in the U.S.[6] Vision of only 20/70 in the better eye was required for driving. The new law[7] requires that a driver must have vision in each eye of at least 20/40. If he has only monocular vision, bilateral mirrors must be employed. People with recent loss of vision in one eye are prohibited from driving for 90 days.[7]

However, many people received their licenses when only 20/70 vision was required, and many may have lost their vision without any change in their driving license. The law now requires eye re-examination after age 70, or after complaint, suspension, revocation, or repeated accidents.[8] As practicing physicians and citizens interested in the health of the community we should 1) advise patients with poor vision to have their eye problems corrected, and 2) report to the Division of Motor Vehicles any person with such poor vision as might produce an accident.

Summary

Vision is virtually the only sensory input determining decisions in driving. In today's high-speed driving a motorist must be able to determine visual clues extremely rapidly. Any decrease in this dynamic visual acuity will significantly increase the likelihood of accidents. Many of the signs are too small to be easily read at high speed. We physicians should make sure that our patients have good vision before they are allowed to drive a car.

There is no reason why highway loss-reduction countermeasure priorities must parallel the rank of causes. Traditional emphasis only on crash prevention ignores major opportunities for reducing losses to damaged people and property. A standard method is needed for rating vehicles' occupant protection considering limits set by physics and body force tolerances. The use of structural damage for crash energy absorption, particularly at 5 to 20 mph, is archaic in comparison with aircraft strut design. It is predicted that the present, structural-damage approach to low speed energy absorption will soon become publicly unacceptable.

Why the Issue is Loss Reduction Rather than Only Crash Prevention

Transcript of a speech delivered during the Automotive Engineering Congress of the Society of Automotive Engineers in Detroit, Michigan, January 12-16, 1970.

WILLIAM HADDON, JR., MD
President
Insurance Institute for Highway Safety

Traditional highway safety efforts have almost exclusively emphasized "accident (ie, crash) prevention" as a sufficient response to reducing highway losses in damaged people and property to the maximum feasible extent. This traditional emphasis, although important as one part of a much broader, modern approach, has for decades written off, by default and omission, many other means for substantially reducing both the human and property losses—means that have nothing to do with crash prevention *per se*. Delaying public understanding of the issues and, hence, of balanced programs of loss-reduction measures, the traditionally narrow highway safety crash-prevention approach continues to consign hosts of Americans to injury and disfigurement, and silently accepts continuing billions of dollars of unnecessary property loss.

Rare indeed, for example, has been the mention in traditional highway safety messages of the need for much better crash-packaging of vehicle occupants to protect them when they are hit, especially from the side; of the urgent need for the systematic, nationwide modification of rigid poles and of other roadside structures so that they no longer kill those who, for whatever reason, hit them; or of the need for the organization and provision of emergency services everywhere to give persons seriously injured on the highway at least the chance they would have if similarly damaged on a jungle battlefield.

The aggregate highway dead in the U. S. will, at present rates of increase, reach 2,000,000 (two million) in 1972,[1] or one man, woman, or child fatally impacted, crushed, lacerated, torn or burned to death for each two miles of the country's total street and road network.

Moreover, means for reducing the nation's astronomical bill for the repair and replacement of sheet-metal and various "crash parts" have completely failed to be noted in traditional messages and programs. (It is noteworthy also that at a time when there is accelerating recognition of ecologic problems, no mention is made of the contribution of the associated drains on both this nation's dwindling raw materials and of those of other countries whose reserves we increasingly consume far out of proportion to our percentage of the world's population.)

Furthermore, the traditional approach to the reduction of highway losses is strikingly different from, and tragically deficient in comparison with, that which mankind has long used in reducing losses in many other instances of harmful ecologic interactions between people and property and their environments. When man learned he could not always prevent ships from colliding, parcel post packages from being dropped or otherwise abused, his toes from being stubbed, or fires from igniting, he did not throw up his hands, regress into ineffectual and defensive talk of "human error", and take the position that nothing further except reforming, "controlling", or educating man could, or even should, be done. To the contrary, he beefed up the resistance of structure, he appropriately packaged that which he valued, he made his packages, themselves, rugged and inexpensive to impact—by design—and he set up fire departments and the Coast Guard. In brief, he concentrated logically and necessarily on measures of whatever type that reduced the end results *per se,* and did not talk inadequately *only* of prevention of the initiation of the untoward events themselves.

Even in dealing with losses from events such as hurricanes and earthquakes over which he had no influence, civilized man long ago largely abandoned emphasis on ideas of retribution and reform, and shifted his loss-reduction approaches to beefing up building codes and the development of modern emergency-response systems.

Nor is such concentration on preventing the end result, rather than hiding behind the excuse of human failing, a new or undisseminated idea. Some three millennia ago, the moral imperative and the practical nature of this central issue were stated incisively and without possibility of misunderstanding by the author of the eighth verse of the twenty-second chapter of Deuteronomy when he wrote: "When you build a new house, you shall make a parapet for your roof, that you may not bring the guilt of blood upon your house, if anyone fall from it."[2]

Even then, it was understood that moral guilt lies in failing to understand and anticipate, through appropriate design and other action, the variability of human behavior and the inevitability of what these days is still conveniently labeled as "human error" and "the nut behind the wheel". Viewed differently, the Biblical imperative was—as the imperative of our ecologically disrupted present must be—to make the environment as harmonious with fallible man as possible, and not to wash one's hands unless one can remake man to suit a hostile environment, especially one of man's own planning, design, and construction.

This Biblical statement implicitly recognizes another one of the scientific principles in approaching the reduction of any category of environmentally damaged people or property. This is that there is no logical reason why the priority (or rank) order of loss-reduction measures must parallel the sequence of causes, a point as yet but rarely understood. In the reduction of the epidemic paralysis of man caused by the poliomyelitis viruses, for example, attempts to reduce human ingestion of the viruses by modifying human behavior through closing theaters, schools, and swimming pools had little or no effect on reducing the losses. The countermeasure that

worked was directed at a later point in the causal sequence and involved successfully modifying the body's interaction with the viral hazard, by increasing body resistance. The electrical fuse is another of the many examples of highly successful measures that greatly reduce losses caused largely by human behavior.

Failure to recognize this fundamental distinction between the rank of causes on the one hand, and the contribution of countermeasures to loss reduction on the other, is the most persistent and tragic characteristic of traditional highway safety thinking and programs. It leads typically to such unscientific and illogical statements as, "If it's the driver, what's the vehicle got to do with it?" This is the equivalent of arguing that just because a postal employee can be expected sometimes to drop a parcel, one should therefore pay no attention to whether the package provides the protection necessary to prevent the breakage of its contents. Surely no industrial shipping executive, for example, would be considered either professionally competent or responsible if he only attempted to prevent untoward events and ignored packaging, and salvage-when-damaged activities. Yet this is precisely the equivalent of what has largely served as "highway safety" during six decades of mounting highway losses.

Nor is there any logical reason or possibility for reducing highway losses in damaged people and property by focusing only on single or small numbers of measures, as is still tragically typical of much long-standing panacea-oriented highway safety activity. Highway loss-reduction measures are not mutually exclusive. To the contrary, maximum feasible loss reduction requires a carefully planned *mix* of complementary approaches involving in various degrees 1) measures that reduce the frequency of the undesirable events, 2) measures that ameliorate the potentially harmful interactions of the events themselves, and 3) yet others that reduce the end losses through post-event emergency salvage, repair, and related activities. (My colleagues and I, in late 1966, introduced the terms "pre-crash," "crash," and "post-crash" to have handles to identify these three "phases" of highway-loss contributors, countermeasures, standards resource allocations, and so forth.)[3,4]

The Federal program was conceived and statutorily mandated by the Congress as a program involving a mix of loss-reduction measures not limited only to the traditional measures (which it recognized as grossly insufficient even when applied), but including a wide range of high-priority crash and post-crash phase measures as well. This is reflected in the program centering on the 16 detailed standards and the corresponding grants-in-aid for state and community highway safety programs which, though year-after-year greatly underfunded, has received since its beginning the overwhelming majority of the Federal highway safety dollar and personnel resources.* The breadth of the approach across all three phases is also true of the much more publicized new vehicle and equipment programs, and of the related standards, whose initial digits, as you know, identify the phase of the highway loss problem to which each is addressed.**

Such broad federal activities and many corresponding accomplishments on the part of vehicle manufacturers—for example, the provision in some, but not most, present automobiles of special structure designed to reduce human losses in lateral collisions—are beginning to move the emphasis of the entire field to loss reduction, but this is, as yet, little in evidence in routine "safety" activities and messages, or in media reporting. In illustration, there is as yet scant public notice or understanding of the fact that a death resulting from hitting a roadside light, sign, or other pole is usually evidence of lethally inappropriate environmental management, in the placement of the pole, in the absence of an intervening guard rail, or commonly, in the failure of some responsible official to require the use of a "breakaway" pole that would have yielded gently rather than sentencing another American needlessly to death. Similarly, the public apparently does not yet know either that many present highway deaths could be prevented by further advances in proper crash packaging, or that different vehicle design approaches that are now rapidly coming within the state-of-the-art would greatly reduce the nation's huge bill for damaged parts, by making vehicles far less susceptible to

---

** The titles of the standards issued to date under the Highway Safety Act of 1966 (P.L. 89-564) a number of which deal with more than one phase of loss reduction programs, indicate the breadth and depth of the State and Community program.*[5]

*** The new vehicle and equipment programs are under the National Traffic and Motor Vehicle Safety Act of 1966 (P. L. 89-563).*

damage. The public is apparently also not yet aware of the appreciable reductions in otherwise fatal and nonfatal injuries, that research on individual crashes is demonstrating, are already being achieved through the vehicle crash design progress of the past few years.

Many considerations must underlie the choice of the mix of loss-reduction measures, their timing, and emphasis. These include:

1) the relationship between their cost, if implemented, and the payoffs in damage to people and property prevented, and

2) the time needed to achieve payoff. The behavior of societies commonly changes appreciably only over generations, road layouts chiefly only over centuries, and roadsides—with public pressure—somewhat more quickly. The vehicle, by contrast, is by far the most rapidly changing and changeable component in the system. Considering this, and the fact that even the early payoffs in injury prevention through improvements in vehicle crash design (and potentially, highway crash design as well), far exceed those scientifically yet shown to result from either crash prevention or post-crash measures, further vehicle crash design improvements to reduce injury, including now common wholesale disfigurement and death, clearly should have the highest priority in the much broader and also necessary mix of other highway loss reduction measures.

In the context of vehicle crash design measures, a crucial aspect of the problem is receiving insufficient professional attention, at least publicly. The great tolerance, provided maximum values are not exceeded, of the properly packaged human body to forces of the transience and directions typical of many vehicular crashes has been reasonably well known in physics terms for years.[6] The maximum forces that a decelerating body (whether car, human, or other) must experience in coming violently to a stop in a given distance have been known in elementary physics since Isaac Newton three hundred years ago and are elementary to this audience. It thus becomes entirely feasible, just as I believe it is necessary to the public interest, for professionals in this field to establish a standard method for rating any given vehicle in terms both of the maximum forward speed of crash (under standardized conditions) in which it will not subject its unrestrained "standard occupants" to injurious forces (ie, to any forces at or in excess of injury thresholds), and of the percentage of the theoretically possible protection it affords at that and other speeds. I believe that if such information were available publicly we would find that present crash performance falls far below that which could be achieved with vehicles of present dimensions, and therefore that assertions that additional, appreciable progress in reducing human losses through further advances in vehicle crash design is rapidly reaching a point of diminishing returns are not now professionally and scientifically supportable.

Another loss-reduction problem that should concern engineering professionals in this field is the glaring discrepancy in acceptable engineering practice between closely related fields. If an aeronautical engineer were to design a landing gear—even for a plane of automobile size—that in absorbing the expected hard bumps of many landings produced any amount of structural, not to speak of passenger, damage, he would be considered incompetent, and his product, if built, probably unsalable. Yet, although there is no engineering necessity to do any structural damage in absorbing energy in at least fore-and-aft impacts at the low speeds generating a huge proportion of the nation's dollar losses in highway crashes, auto design continues to absorb the energy of even 5 to 20 mph crashes by damaging structure, an archaic engineering solution, and one, I believe, that will soon be publicly unacceptable in this country.

The owner of a late model car spends from 60% to 80% of his premium dollars on vehicle, rather than injury insurance.[7] When analyses are made of the size of the claims for vehicle damage it is found that most are of relatively small size, cumulating to the huge national losses now exceeding some $12 billion per year in physical damage alone.[8]

Even when weighted for claim size, the small claims contribute overwhelmingly to the overall dollar losses.

As you may know, these data are from much more extensive information given in Congressional testimony, accompanied by information showing that low speed (5 and 10 mph) barrier impacts of standard sedans produced dollar damage far exceeding the size of most of the property damage claims.* This problem of largely eliminating fore-and-aft automobile, low speed crash damage from the United States is largely soluble using present engineering knowhow, copying, for example, from the far more advanced engineering of the aircraft strut manufacturers. These, then, are some of the considerations the public, and especially the members of this professional society should consider in approaching the reduction of the appalling losses of one of our nation's most urgent and costly ecologic problems.

** See appendix for the parts, labor, and dollar costs of 5 and 10 mph barrier crashes of four kinds of standard 1969 four-door sedans.*[9]

APPENDIX

LOW-SPEED BARRIER CRASH TESTS

5 mph Front	*Parts*	*Paint & Sublet*	*Labor (Hours)*
A. 1969 Chevrolet Impala 4-door			
Replace front bumper	$ 65.50		2.3
Repair front bumper back bars			0.5
Replace grille lower	8.50		
Replace grille bumper lower guards L & R	11.00		
Replace grille center	14.95		
Repair grille vertical support			0.3
Repair radiator core support & baffles			1.0
Repair hood panel			3.5
Repair fender R/F			1.0
Refinish as necessary		$ 6.00	3.0
			* 11.6 hrs.
Subtotals	$ 99.95	$ 6.00	$81.20
TOTAL $187.15			
B. 1969 Ford Galaxie 500 4-door			
Replace front bumper	$ 52.30		0.7
Repair front bumper back bars			0.5
Replace fender extension R/F	8.70		0.6
Replace fender extension L/F	8.70		0.6
Repair hood panel			1.0
Repair fender R/F			4.0
Repair fender L/F			0.8
Replace fender lower rear moulding R/F	3.10		0.3
Replace door moulding lower L/F	3.90		0.3
Refinish as necessary		$ 8.00	4.0
			* 12.8 hrs.
Subtotals	$ 76.70	$ 8.00	$89.60
TOTAL $174.30			
C. 1969 Plymouth Fury I 4-door			
Replace front bumper	$ 53.55		0.8
Repair bumper back bars			0.5
Repair front bumper lower panel			1.0
Replace grille center	19.50		0.8
Repair radiator core		$10.00	
Repair radiator core support			1.5
Replace hood moulding	1.70		0.2
Repair hood panel			1.0
Refinish as necessary		2.00	1.0
			* 6.8 hrs.
Subtotals	$ 74.75	$12.00	$47.60
TOTAL $134.35			
D. 1969 Ambassador SST 4-door			
Replace front bumper	$ 54.35		1.0
Repair front bumper back bars			0.5
Repair front bumper lower panel			0.5
Repair grille center	36.50		0.5
Repair radiator core support			2.0
Replace fender extension L/F & R/F	9.30		1.0
Repair fender R/F			3.0
Repair fender L/F			2.5
Repair hood panel			5.0
Repair cowl L/F			1.5
Repair door L/F			0.5
Repair door R/F			1.0
Refinish as necessary		$16.00	8.0
			*27.0 hrs.
Subtotals	$100.15	$16.00	$189.00
TOTAL $305.15			

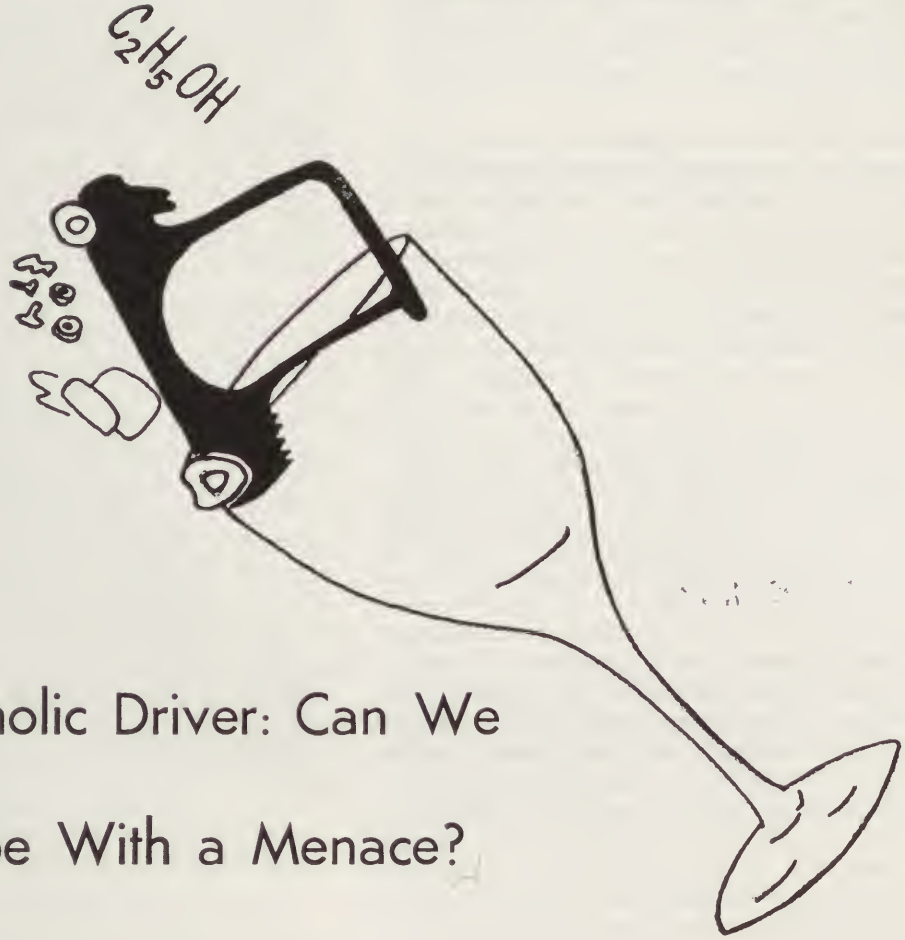
5 mph Rear	*Parts*	*Paint & Sublet*	*Labor (Hours)*
A. 1969 Chevrolet Impala 4-door			
Replace rear bumper face bar L & R	$ 33.90		1.7
Repair rear bumper back bars			1.0
Repair deck lid			1.0
Repair quarter panel L			2.5
Repair quarter panel R			10.0
Refinish as necessary		$10.00	5.5
			* 21.7 hrs.
Subtotals	$ 33.90	$10.00	$151.90
TOTAL $195.80			
B. 1969 Ford Galaxie 500 4-door			
Replace rear bumper face bar	$ 50.25		1.0
Repair rear bumper back bars L & R			1.0
Repair lower body panel & floor			2.0
Replace quarter panel extension & moulding L	18.35		0.8
Repair quarter panel center L			3.0
Repair frame rail L			3.0
Refinish as necessary		5.00	3.5
			* 14.3 hrs.
Subtotals	$ 68.60	$ 5.00	$100.10
TOTAL $173.70			
C. 1969 Plymouth Fury I 4-door			
Replace rear bumper face bar	$ 52.80		0.8
Repair rear bumper back bars			1.0
Repair lower body panel			2.0
Repair quarter panel L			3.5
Refinish as necessary		$ 6.00	3.5
			* 10.8 hrs.
Subtotals	$ 52.80	$ 6.00	$82.60
TOTAL $134.40			
D. 1969 Ambassador SST 4-door			
Replace rear bumper face bar	$ 54.35		1.1
Replace rear bumper back bars vertical	1.60		
Repair rear bumper back bars L & R			1.0
Repair rear lower body panel			1.0
Repair deck lid			2.5
Replace quarter panel extension L & R	22.00		1.2
Repair quarter panel outer L/R			11.0
Replace quarter panel outer moulding U&L, L/R	4.00		0.4
Replace & finish quarter panel outer moulding, L/R	7.45		
Repair quarter panel outer R/R			8.0
Replace quarter panel name plates L & R	3.70		0.4
Replace quarter panel outer moulding U&L, R/R	4.00		0.4
Replace & finish quarter panel outer moulding, R	7.45		
Refinish as necessary		$10.00	7.0
			* 34.0 hrs.
Subtotals	$104.55	$10.00	$238.00
TOTAL $352.55			

* Labor charged at $7/hour

10 mph Front	*Parts*	*Paint & Sublet*	*Labor (Hours)*
A. 1969 Chevrolet Impala 4-door			
Replace front bumper face bar	$65.50		2.3
Replace front bumper face bar guards L & R	11.00		
Replace front bumper lower valence	9.75		0.6
Replace front bumper back bars—inner	11.00		
Replace front bumper back bars—outer	9.00		
Replace grille lower	8.50		0.2
Replace grille upper and emblems	18.10		0.5
Replace grille vertical support	2.25		
Replace grille upper tie bar (fender)	5.15		0.3
Replace grille support outer L & R	3.50		
Replace radiator core support	26.75		1.5
Repair radiator core		$12.00	
Replace radiator fan shroud	8.25		
Replace fender L/F	64.50		1.5
Replace fender moulding—upper L/F & R/F	21.50		1.2
Replace fender moulding wheelhouse, L/F & R/F	15.90		0.4
Replace fender R/F	64.50		1.5
Replace fender inner skirt, L & R, straighten			3.0
Replace hood panel	71.25		0.9
Replace windshield lower reveal moulding	15.80		0.8
Replace windshield wiper blade L	3.40		
Repair cowl panel R/F straighten			1.5
Repair cowl panel L/F straighten			0.5
Repair door assy. L/F, straighten and align			1.0
Repair door assy. R/F, straighten and align			1.5
Replace rocker panel moulding R	9.25		0.4
Replace door assy. L/R, straighten and align			0.5
Refinish as necessary		15.05	7.6
			* 27.7 hrs.
Subtotals	$444.85	$27.05	$193.90
TOTAL $665.80			

B. 1969 Ford Galaxie 500 4-door			
Replace front bumper face bar	$ 52.30		1.4
Replace front bumper face bar panel	4.00		
Replace front bumper back bars—outer L & R	1.80		
Replace front bumper back bars—inner L & R	12.90		
Replace front bumper gravel deflector	10.55		0.6
Replace grille assembly	31.70		0.5
Replace grille assembly brackets L & R	2.60		0.4
Replace H/L door L	8.10		0.3
Replace radiator core support, straighten and align			1.5
Replace fender L/F	59.90		2.0
Replace fender extension L/F	8.70		
Replace lower moulding rear L	3.10		0.3
Repair fender inner skirt L/F, straighten			0.5
Replace fender R/F	59.90		2.0
Replace fender extension R/F	8.70		
Repair fender inner skirt R/F, straighten			1.0
Repair hood panel, straighten and align			2.5
Replace hood panel, lower latch and supports	3.75		0.2
Replace fan shroud	11.65		0.3
Repair door assy. R/F, straighten and align			1.0
Repair door assy. L/F, straighten and align			1.0
Replace transmission rear extension housing	32.00		1.2
Eleven quarts transmission fluid	6.05		
Refinish as necessary		$9.80	5.8
			* 22.5 hrs.
Subtotals	$317.70	$ 9.80	$157.50
TOTAL $485.00			

C. 1969 Plymouth Fury I 4-door			
Replace front bumper face bar	$ 53.55		1.0
Replace front bumper back bar—outer L & R	8.20		
Replace front bumper back bar—inner L & R	7.40		
Replace front bumper gravel deflector	13.75		0.7
Replace grille assy.	19.50		0.8
Replace grille vertical support—outer L & R	3.90		
Replace grille vertical support—center and lock support	4.85		0.3
Repair radiator core support			2.0
Replace radiator core assy.	88.85		1.0
Replace radiator fan blade	4.50		0.4
Replace H/L doors L & R	13.50		0.4
Replace fender L/F	60.00		2.1
Repair fender inner skirt L/F			
Repair fender front extension L/F	8.60		
Replace fender R/F and Brace	61.50		2.1
Replace fender extension R/F	8.60		
Repair fender inner skirt, straighten			1.0
Replace hood panel and align hinges	75.80		1.9
Replace hood latch—upper	3.25		
Repair cowl L/F			1.0
Repair cowl R/F			1.0
Replace lower windshield moulding	12.50		0.5
Replace windshield wiper blade R	3.50		
Repair door assy. L/F, align			0.5
Repair door assy. R/F, align			0.5
Refinish as necessary		$16.00	8.0
			* 25.2 hrs.
Subtotals	$451.75	$16.00	$176.40
TOTAL $644.15			



D. 1969 Ambassador SST 4-door			
Replace front bumper face bar	$54.30		1.0
Replace front bumper back bars—outer L & R	4.60		
Replace front bumper back bars—inner L & R	7.00		
Replace front bumper gravel deflector	15.75		0.5
Replace grille assembly	36.50		0.5
Replace grille assembly support brackets	4.00		
Replace headlamp doors L & R	19.10		
Replace headlamp outer assembly L & R	21.70		0.5
Repair headlamp mounting plates L & R			1.0
Repair radiator core support and baffles			2.0
Replace radiator core assembly	78.65		0.8
Replace radiator fan blade assembly, 7 blades	18.50		0.5
Replace fender L/F	62.65		2.5
Replace fender extension L/F	4.65		
Replace fender lower moulding L/F	1.30		
Replace fender wheel open moulding L/F	4.05		
Replace fender decal	18.95		1.1
Replace fender R/F	62.65		2.5
Replace fender extension R/F	4.65		
Replace fender wheel open moulding R/F	4.05		
Replace fender decal	18.95		1.1
Repair fender inner skirts and baffles L/F			2.0
Repair fender inner skirts and baffles R/F			2.0
Replace hood panel and align hinges	78.30		1.3
Replace cowl upper top panel	11.95		0.5
Repair cowl assembly and door assembly L/F			1.0
Repair door assembly R/F, straighten and align			2.5
Replace motor mounts L & R	9.10		0.8
Replace motor mounts rear	5.60		0.4
Replace fan shroud	7.50		
Replace drive shaft		$10.00	
Refinish as necessary		16.65	8.9
			* 33.4 hrs.
Subtotals	$554.45	$26.65	$233.80
TOTAL $814.90

The Alcoholic Driver: Can We Cope With a Menace?

An excellent brochure prepared by the Office of the Highway Safety Coordinator of Maryland [1] begins with the disturbing question, "WHY Doesn't Somebody Do Something About Traffic Safety?" It goes on to say that there are more than 200 motor vehicle accidents every day in Maryland and that as a result, two people are killed and more than 100 are injured or maimed every day in the year. What must be added is the startling fact that the excessive use of alcohol contributes to half of these accidents and that "alcoholics and other problem drinkers, who constitute but a small minority of the general population, account for a very large part of the overall problem." [2]

Fortunately, Maryland is in an enviable position to launch a comprehensive attack on the drinking driver problem. Maryland is the only state, thus far, to have passed an expressed consent law, as opposed to implied consent. Also, the Comprehensive Intoxication and Alcoholism Control Act charges the Division of Alcoholism Control in collaboration with the courts, police, and the Department of Motor Vehicles, with responsibility for proposing appropriate programs of alcoholism education and treatment for individuals convicted of "driving under the influence". The Division has therefore created a Task Force on Traffic Safety to take significant new steps to implement, with greater effectiveness, the national standard on Alcohol in Relation to Highway Safety.

Because Maryland is regarded in national circles as having one of the best alcoholism treatment programs in the country, it was selected as one of three states to participate in a working conference in November 1969 in Ann Arbor, Michigan, on "Community Response to Alcoholism and Highway Crashes". A significant theme at the conference was the use of "constructive coercion" in uncovering the basic motivation in all suffering alcoholics to secure help for their addictive abuse of alcohol. That layers of resistance and rationalization, laid down in a society which itself resists the understanding of alcoholism as an illness, can be stripped away by the work of alcoholism counselors and therapists, will be seen in the following report prepared by two of the authors (A.M.S. and N.W.):

> "A number of patients presenting themselves at the Baltimore City Department of Health's Alcoholism Center come with a well defined goal in mind. These patients seem to be motivated to stop drinking, not for what alcohol is doing to them physically and psychologically but in order to hold their job, regain their driver's license, etc. They usually appear to be under great pressure and are quite intolerant to frustration or any delay in obtaining their objective. Basically they have not accepted the fact that they are alcoholics in need of treatment and, on the surface, appear to accept what the clinic has to offer in treatment—sometimes going so far as to take Antabuse. The therapist is frequently the frustrating agent in their eyes, and the one who callously is causing the delay in reaching their goal. With the patient who feels this way, considerable energy will be generated in finding ways and means of manipulating the situation.
>
> "The following two cases are men who were referred to the Center for treatment as part of the process of having their driver's licenses reinstated.
>
> "The first case, Mr. L., was seen at the clinic for the first time on March 22, 1968. He came to us for help in dealing with the many pressures and problems that were converging on him from all sides. He had lost his job with the Pennsylvania Railroad Company after 28 years, his wife was planning to leave their home and move into an apartment on her own, and he had lost his driver's license for driving while intoxicated.
>
> "Mr. L. is a handsome man with a smooth manner. Undoubtedly he had held off disaster for years with his charming and pleasing ways, but now he was full of self-pity and badly frightened. He was not ready at first to accept much responsibility for his actions that had brought on the current disasters and put the blame on others. He did not see himself as an alcoholic, though he was very willing to give lip service to the idea.
>
> "Mr. L. had three goals in mind, in the following order of importance: (1) to be given another chance by his wife; (2) to have his driver's license restored; and (3) to find a job. Goals one and three were quickly attained, but getting a driver's license was quite another matter. His frustrations mounted and he began to lose his smooth manner. He had trouble accepting the fact that the clinic could do no more than send his attendance record to the Department of Motor Vehicles and give him prescriptions for Antabuse. Although he seemed to be cooperating in his treatment program, this was not enough for Mr. L., and he sulked and became impatient. After taking Antabuse for a short period of time, he felt he could do without it. When, upon request, another report was sent to the Department of Motor Vehicles indicating his withdrawal from Antabuse, Mr. L. promptly reacted by writing threatening letters to the Center and to the Department of Motor Vehicles and doing much "VIP" name-dropping. However, he quickly resumed taking Antabuse and continued to attend group meetings at the Center.
>
> "Following this flare-up, Mr. L. settled down and his participation in group sessions changed from a passive, smug one to an active, mature one. He stopped trying to bully his way to his goal and came to grips with his own immaturity. He even said in a group session regarding someone else's problem, 'Don't expect the clinic to lie for you—they won't'.
>
> "In June 1969, Mr. L.'s driver's license was reinstated. Mr. L. was pleased but made no big issue of it and continued taking Antabuse and attending his meetings. There has been a marked change in his manner of handling himself, and his group feels that his battle to get his driver's license was significant, since this was the first time that what he wanted was not handed to him on a silver platter.

Immature Patient Faces Reality

"The second case, Mr. K., concerns a 36-year-old man who was first seen at the clinic in 1965. He had a long history of trouble with the law since the age of 17 and numerous state hospital admissions due to his alcoholism. He had a fifth grade education and his work record was spotty. In 1962 he married a patient he had met at a state hospital and had two children. Mr. K. is a well-built virile-looking man with a very appealing personality. He enjoys playing the clown and also overtly admires women. In the beginning, his approach to the clinic was casual and his attitude was, 'I'll try to be a good boy'. He did not seriously accept the fact that he could not drink and wasted much time trying to prove to himself that he could. He obviously needed to drink to prove his masculinity to himself and to his crowd. It was difficult for Mr. K. to accept the fact that he had many other likeable traits besides the "clown" and "lothario".

"Mr. K.'s course in the clinic remained very erratic until July 1967, when he agreed to try Antabuse. This decision followed a group session when he had complained bitterly that the clinic was not helping him get his driver's license. At this point, the group confronted him: 'If you were in their place, would you recommend that you be reinstated?' Mr. K. was forced to admit that the clinic had no choice in the matter if he continued to drink. So, Mr. K. started on Antabuse. Now, instead of pushing people around, he felt he was being pushed and maneuvered into sobriety and this he resented, so on two different occasions he drank on top of taking the Antabuse. Again his behavior got him nowhere, so slowly but surely he began to look at and face up to the reality that was confronting him on all sides. He stopped drinking.

"Mr. K., to the best of our knowledge, had his last drink in November 1968 when he and one of the clinic patients went drinking and dancing. The following day a most contrite Mr. K. called and was told he could return to Antabuse in two days, which he did. In March 1969, his driver's license was reinstated.

"Since Mr. K. finally achieved his goal he has continued to attend group therapy sessions, perhaps more frequently than previously. He has developed some leadership qualities that must give him great satisfaction. We no longer have to contend with a stubborn "actor", and his manner is mature and level-headed. His marriage appears to be running smoothly and he is holding down a good job.

"These two cases illustrate the effectiveness of a firm, steady stance in helping the alcoholic face the reality of the given situation. To realize that no one can or will run his life for him is a big step forward. If he wants to achieve a certain goal, we will support him in his efforts, but the goal will remain his and the rules will be guidelines. We cannot cover up for him and, in the long run, his own recommendations for himself will be the ones that count."

Treatment facilities and services for alcoholics will represent an integral part of any practical effort to reduce the toll of traffic accidents. The practicing physician to whom the patient, who often conceals or denies his alcoholism, turns for help with drinking problems must learn to confront the patient with the realistic consequences of his behavior disorder without, in any sense, being punitive. Alcoholics *can* be helped to recover and the effect on our highway statistics should be astonishing to the many skeptics. Certainly the rest of the nation is looking to Maryland to continue its leadership in what has been called the nation's number one public health problem.

Sex

The role of the physician changes from time to time and is dependent upon many variables. We are in a most unique position, for although our job is to relieve suffering and stave off death, we can at best only temporize, since all of our patients are going to die someday of something. We are one of the few callings who are in business to do ourselves out of business.

As the preventers of disease, what then is really our responsibility and, what are we doing to prevent accidents and death on the highway? It would appear that our responsibility is certainly great as we see the horrible results of traffic accidents and know that practically all of these accidents can be prevented.

What, then, can you and I do about applying good scientific methods to accident prevention? Some of the suggestions we can follow to help prevent accidents ourselves include always, and in all ways, driving defensively, maintaining our cars in the best possible shape, and insisting on owning all optional safety devices, including the proper tires at the proper inflation for your car. Limit your driving when tired, emotionally upset, or under the influence of alcohol. Adjust your driving and speed to current conditions of the highway, weather, and traffic. Don't rush, keep your temper, and personally, in your own community, support better law enforcement, highway improvement, driver education in the schools, and improved driver licensing. Be firm about any patient's medical disability which should keep him or her from driving a car.

Now, how can we help prevent injury in the case of the "second collision", that is, the passenger colliding with the inside of the car? First, and foremost, *use* the seat belt and shoulder harness. Insist upon buying and driving that car with the greatest number of safety features such as padded dash, collapsible steering wheel, and head supports, and such occurrences can be prevented. Unfortunately, we do not seem to be doing much about seeing to it that they do not take place.

Modern Medicine published a series of articles in the spring of 1967 about "The Physicians' Role in Highway Safety", and the Travelers Insurance companies sent out a booklet called "Was It Sudden?" They both point out ways we can help to reduce the accident rate, with its concomitant pain and anguish. They suggest that simply to blame the car, the driver, alcohol, poor roads, conditions, or any one single cause is far from a scientific approach to the problem. The causes of accidents are many, and work in a "system" or chain reaction to bring a tragic or happy ending to any driving experience. You have a car in more or less good condition, and then you yourself—tired, awake, worried or relaxed, on a road that is well-lighted or dark, and wet or dry. Then add or take away any one of another thousand or more factors, and you may have some leads as to the causes of accidents. Remember also that the higher the speed, the greater the severity of the accident.

There are misconceptions in the minds of some people which we must help put aright. For example, some have suggested that a seat belt would prove fatal in case of fire or submergence. The facts are that the chances of survival are greatly increased with the use of the seat belt, since the passenger has been protected from the "second collision", and is, therefore, much more likely to be conscious and able to escape. In every discussion of safety, there is usually one person who knows of someone who was thrown from a car and suffered only minimal injuries. For every one of those cases, we can show you ten whose lives were saved by being belted in. And so, on and on with the feeble excuses that keep you from facing the obvious fact that you and your family can be killed or maimed, in your own car, today. If you carry insurance on your car for fear it might be damaged, take out some safety and accident insurance for yourself, for fear you and yours might be damaged. There is a shortage of physicians. Please don't be afraid to be afraid.

Oh, yes, if you have wondered why this was entitled "Sex", be honest, now. Would you have read it at all if it had been called "Automotive Safety?"

Our greatest accomplishments as physicians have really been in the field of preventive medicine. It seems odd, then, that we the preventers, the healers, would do so little about a preventable phenomenon—traffic accidents —that kills about 60,000 men, women, and children each year, and injures about 4-1/2 million.

WILLIAM K. KELLER, MD Chairman

Kentucky Medical Association Committee on Highway Safety

your medical faculty at work

by John Sargeant
Executive Director

The Executive Committee met on Thursday, March 12, 1970, and took the following actions:

1. Declined to concur in the request of the MEDIC Subcommittee to request all chiefs of staff at all Maryland general hospitals to permit substitution of attendance at MEDIC programs for required attendance at staff meetings;
2. Declined to circulate a letter urging members to purchase U.S. Savings Bonds;
3. Authorized the attendance of the **Executive Director** and **Arthur G. Siwinski, MD,** at a regional conference on Quackery scheduled for Boston on Friday, May 1;
4. Declined to endorse a proposed educational symposium/tour to be sponsored by Squibb and Company;
5. Directed that a list of hospitals, scheduled for JCAH resurveys in 1970, should be included in the next Executive Director's Newsletter. Physicians are requested to advise the Faculty staff of any problems that should be specifically investigated;
6. Adopted a position that the concept of special diets for welfare recipients are warranted when the medical condition of the patient requires such treatment;
7. Agreed to meet jointly with the Maryland State Dental Association Executive Committee at the Statler-Hilton Hotel, Annapolis, on Tuesday, May 19, at 6:00 PM to discuss mutual problems;
8. Authorized the President to prepare a list of nominees for consideration by the Governor for possible appointment to the Board of Nursing Home Administrators Examiners;
9. Authorized the sum of $450 as a contribution to the University of Maryland School of Medicine Student AMA Chapter to assist in its regular activities, as well as a special regional meeting;
10. Heard further information with respect to the 1970 budget and formulated recommendations for presentation to the Council;
11. Received for information a copy of a letter to the President of the United States from Ross Z. Pierpont, MD, regarding education of physicians.

The Council met on Thursday, March 19, 1970, and took the following actions:

1. Renewed, on recommendation of the Executive Committee, the contract of the Executive Director for a three-year term on the same conditions and terms as previous years;
2. Approved the revised budget for 1970 operations;
3. Referred two resolutions from Prince George's County to the House of Delegates for consideration and any action it may wish to take;
4. Affirmed action of the Bylaws Committee in connection with a proposed Bylaw amendment from the Montgomery County Medical Society;
5. Heard a report from the Legislative Committee chairman on current activity in the State Legislature;
6. Adopted a resolution on Transportation of Emotionally Ill Patients which appears at the end of this report;
7. Adopted a position of support for repeal of all abortion laws in Maryland;
8. Authorized employment of Public Relations Consultants for the annual session;

(Continued next page)

9. Determined that no annual or semiannual session should be held outside of a 200 to 300 mile radius of the Baltimore city area, but that nothing precludes any postconvention session being held outside of this radius;
10. Authorized the Executive Committee to meet with Hospital Council representatives to discuss current refusal of payments for medicare patients in hospitals throughout the State.

Transportation of Emotionally Ill Patients

WHEREAS, Humane and therapeutic considerations clearly dictate that all psychiatric patients, under all circumstances, be treated with respect and dignity, as well as sympathy and compassion for all his needs and feelings, and

WHEREAS, Initial contacts and subsequent handling of such psychiatric patients immediately following departure from familiar and homelike surroundings have a great bearing on the long-term welfare of the patient, and

WHEREAS, Methods and procedures followed in transporting patients to psychiatric care facilities should be selected with due recognition of the psychological effect on such patients at a time of crisis in his life; therefore be it

Resolved, That the Medical and Chirurgical Faculty of Maryland urges the Department of Health and Mental Hygiene to assume leadership in initiating collaboration with local health authorities for the purpose of studying the problems presently encountered in the transportation of emotionally disturbed patients and devising realistic plans for the resolution of said problems.

The Council met on Wednesday, April 1, and Friday, April 3, 1970, and took the following actions:

1. Adopted various minutes of previous sessions;
2. Expressed appreciation to the outgoing Council members and to the Council chairman for service during the past year;
3. Elected **Manning W. Alden, MD,** Annapolis, as Council Chairman;
4. Elected **John M. Dennis, MD,** Baltimore, as Council Vice-Chairman;
5. Elected **Arthur G. Siwinski, MD,** Baltimore, to serve the balance of an unexpired term of **Harry M. Robinson, Jr., MD,** Baltimore, who resigned from the Council. The term expires with the annual meeting, 1971.

The House of Delegates met on April 1, 1970, and took the following actions:

1. Adopted minutes of previous House sessions;
2. Heard brief comments from presidents of the West Virginia and Pennsylvania Medical Societies;
3. Observed a moment's silence in memory of deceased members;
4. Adopted a resolution honoring **Robert W. Johnson, MD,** 1891-1969;
5. Presented an Honorary Membership certificate to **W. B. Kouwenhoven, Dr.Ingr., MD (Hon);**
6. Awarded Fifty-Year pins to the following:

Baltimore City: **Leslie N. Gay, MD**
Louis F. Krumrein, MD
F. Fred Ruzicka, MD
Austin Wood, MD
Allegany County: **Howard L. Tolson, MD**

The following members could not be present for presentation of their pins:

Baltimore City: **Zachariah R. Morgan, MD**
John G. Murray, MD
Baltimore County: **Lee K. Fargo, MD**
Carroll County: **Charles L. Billingslea, MD**

7. Granted Emeritus Membership to the following:

Baltimore City:	**Melvin H. Crocker, MD**
	Walter E. Fleischer, MD
	Ralph S. Penner, MD
	Alexander J. Schaffer, MD
	Joseph Sindler, MD
	Harry B. Smith, MD
	William S. Stone, MD
Baltimore County:	**William E. Martin, MD**
	William H. F. Warthen, MD
Carroll County:	**Charles L. Billingslea, MD**
Montgomery County:	**Paul N. Fleming, MD**
	Paul V. Starr, MD

8. Heard comments from the President regarding the Medicare and Medicaid programs; the importance of Peer Review activities; and the professional liability insurance program;
9. Deferred action until the Friday session on two resolutions referred to the House by the Council through Prince George's County Medical Society;
10. Heard a brief report from **George G. Finney, Jr., MD,** Baltimore, as chairman of the Maryland Medical Political Action Committee;
11. Received the 1970 budget from the Treasurer;
12. Adopted the following two motions regarding the MEDIC program:
    (a) That the MEDIC Network be continued and that such funds to the extent of $16,000 be appropriated to finance the operation of the system for a one-year period, in order to produce stability and enable proper planning of programs of desired quality
    (b) That a formal evaluation of the MEDIC program be made available when this item is up for consideration again;
13. Adopted various Bylaw amendments;
14. Adopted the following amendment to the Medicolegal Code of Cooperation:
    "Upon engaging a physician for consultation, evaluation and/or testimony, the attorney should make it clear whether the patient or the attorney will be responsible for payment of the fee."
15. Received the Nominating Committee Report and received no nominations from the floor;
16. Heard a verbal report from the Legislative Committee Chairman on activities during the recent General Assembly session;
17. Adjourned until Friday. (A report on the April 3 meeting will appear in the June *Journal.*)

MEDICAL NEWS

The newly elected executive vice-president of the Good Samaritan Hospital, Inc. is **John C. Harvey, MD,** of Baltimore. Dr. Harvey is professor of medicine at The Johns Hopkins School of Medicine.

* * *

A. Edward Maumenee, MD, professor of ophthalmology and director of the department of ophthalmology at The Johns Hopkins School of Medicine, has been elected president of the American Academy of Ophthalmology and Otolarygnology.

* * *

Liaison between the Student American Medical Association and the American Medical Association staff will be the responsibility of the editor of American Medical News, Marvin L. Rowlands.

The appointment was made by Ernest B. Howard, MD, executive vice-president of the AMA.

Rowlands' assignment will supplement the work of the liaison committee of the AMA Board of Trustees. Irvin E. Hendryson, MD, Albuquerque, N.M., who is vice chairman of the AMA Board, serves as chairman of its SAMA liaison committee.

"I have asked that greater emphasis be placed on liaison between SAMA and the AMA staff, Dr. Howard said. "Marvin Rowlands has been directed to coordinate efforts of the AMA staff to provide every possible assistance which SAMA members and staff request."

Dr. Howard emphasized that the AMA staff recognizes the autonomy of SAMA, but said that the AMA can offer many supporting services to assist the medical students' organization.

The AMA headquarters building is in downtown Chicago and the SAMA executive offices are in Flossmoor, a Chicago suburb.

Rowlands has been a member of the AMA staff since 1958, and editor of *American Medical News* since 1965. Previously, he served as managing editor and an associate editor of the newspaper.

* * *

Thomas B. Turner, MD, dean emeritus of The Johns Hopkins University School of Medicine, has received the William Freeman Snow award for distinguished service to humanity. It is the highest award presented by the American Social Health Association.

* * *

Jonathan E. Rhoads, MD, a 1932 graduate of The Johns Hopkins University School of Medicine, has been named president of the American Cancer Society.

Dr. Rhoads is director of the University of Pennsylvania School of Medicine's Harrison Department of Surgical Research.

* * *

Each morning, five days a week, more than 15,000 people pour into the complex of buildings which make up the Social Security Administration's national headquarters in Woodlawn. For most of them, this is the start of another sedentary day.

More than a year ago, physicians at Social Security and at the Baltimore Public Health Service Hospital decided to find out just what the state of cardiovascular health was at the agency. More specifically, they wanted to know what effects sedentary employment has on the heart.

In an initial IBM card survey of 5,000 male employees, 20% indicated they had either a history of cardiovascular disease, or some symptom or finding suggesting such a disease. The preliminary study convinced Drs. Edward Hinman and Richard Warbasse of the PHS Hospital that a more extensive survey was called for. A massive heart disease prevention and research study—the largest of its kind ever conducted at a Government facility—was launched. Over the next two years, more than 20,000 current and future SSA employees will undergo a battery of tests and X-rays designed to shed more light on the largest single cause of death in the nation.

A team of physicians from PHS and paramedical personnel from both PHS and SSA will be working under unique conditions —a controlled atmosphere.

"The SSA was selected for the study because it has the characteristics and personnel that can provide the information needed to expand cardiovascular knowledge. In addition to uncovering heart disease in its early stages, we hope to learn more about the effects of sedentary employment on the cardiovascular system," the medical director of SSA stated.

Although the study will concentrate on heart disease, it should provide additional information on various related and unrelated illnesses such as lung cancer, tuberculosis and hypertension.

The initial two-year phase will be the first of several in the continuing study. It is planned that follow-up examinations will be repeated after a five-year interval.

* * *

Stewart Wolf, MD, a 1938 graduate of The Johns Hopkins University School of Medicine, has been named scientific director at the Marine Biomedical Institute in Galveston, Texas.

* * *

A new film, "Next Witness," depicts to physicians what may be expected of them if called upon to be a medical witness in personal injury litigation. The film stresses the importance to both the physician and the attorney of pretrial preparation for the medical witness; the story line shows how the lack of preparation could create awkward and embarrassing situations in court. About 70% of all court actions constitutes personal injury litigation, often requiring a physician's testimony.

"Next Witness" is a 16mm, sound color film. Prints are available on loan from the AMA Film Library, 535 North Dearborn Street, Chicago, Ill. 60610.

A spokesman for the National Association of Blue Shield Plans (NABSP) expressed disappointment over the data in the Report of the Staff to the Senate Finance Committee on the problems of Medicare and Medicaid.

Speaking for NABSP the coordinating office for 72 U. S. Blue Shield Plans which serve more than 76 million Americans, Ned F. Parish, NABSP Executive Vice-President, said in Chicago:

"We were called on by government in 1966 to assist in the administration of the Medicare program, which was designed in a manner contrary to the suggestions we had made based on 25 years of experience.

"Now, we are faced with a report which states that Blue Shield Plans paid more to physicians for taking care of Medicare patients than for patients covered by Blue Shield private programs.

"The report takes Blue Shield fee schedules—some developed more than 15 years ago—and compares them to Medicare payments in 1968. Obviously these fee schedules, some of which were designed for partial payment to physicians, do not meet current physician charges.

"Medicare administration calls for payment to the physician on the basis of the usual, prevailing and reasonable charge. In comparing this with Blue Shield programs based on the same payment principle, there was no significant difference in the amounts allowed to physicians."

Parish said he had testified before the House Ways and Means Committee on November 10, 1969, and had submitted a study entitled "Physician Fees: A Comparison of Government and Non-Government Carrier Payments," which was prepared by Edward S. Mills, PhD, and Theodore F. Lake, MBA, of the NABSP staff.

This study showed that "no statistically significant difference existed between the charge levels allowed by Blue Shield carrier Plans for Medicare and for their private enrollment, when the comparable customary, prevailing and reasonable charge method of payment was used."

Parish said findings of this Blue Shield study were distributed to the news media and government agencies, "and we have not received any comments critical of our approach to the data, and our interpretation of it."

The Blue Shield executive reported that Mills and Lake had analyzed Chart 1 of the staff report and had found the following:

- The Senate staff report indicates an average Medicare payment by Alabama Blue Shield for an inguinal hernia is $193 compared to the Blue Shield maximum payment for private business of $75. The $75 figure is from the Alabama Plan's lowest level contract—last revised in 1956—which was never intended as a paid-in-full schedule.

- For a cholecystectomy operation, the Senate staff report lists an Alabama Blue Shield maximum of $100—again from the lowest level fee schedule—compared to the average Medicare payment of $303. NABSP computation of the Alabama data indicates an average Medicare payment of $289 and a private business average payment of $286.

- In Michigan and Minnesota, the average Blue Shield figure for a prostate operation was higher than the average Medicare payment. In Michigan, the Blue Shield allowance was $398 and for Medicare, $389. In Minnesota, the private subscriber fee was $384, but only $348 for the average Medicare patient.

The Colorado Blue Shield Plan has also taken issue with Chart 1 which shows that the average Medicare cataract operation in Colorado costs $348 as compared to "Blue Shield maximum payment" of $250. The Colorado Plan pointed out that the $348 represented a cataract operation in 1968, compared to a Blue Shield schedule of $250 for this operation in 1953.

The Senate staff report resulted in the following sensational headline in the *Rocky Mountain News* on February 8: "One Colorado Doctor Reaps $326,262 From Medicare." The story indicated that another Colorado physician had

earned some $150,000 from Medicare.

John J. Vance, Executive Vice President of Colorado Blue Shield, said the $326,262 payment was actually made to staff physicians at Colorado General Hospital for hundreds of procedures, X-ray, and laboratory charges by many staff physicians in the teaching institution.

As for the $150,000 payment, this was made to the Denver General Hospital, again for services performed by a number of physicians.

Parish concluded: "It is unfortunate that because of the complexity of the subject a report of this sort is open to such misinterpretations. We are giving our full attention to the report and will make additional comments where warranted.

"We are concerned about rising health care costs and are taking measures to contain them. But in the inflationary economy which we have experienced, it is unrealistic to compare physician charges today with fee schedules developed 10 to 15 years ago for programs which were vastly different from Medicare."

This year will mark the 42nd observance of May as Better Hearing and Speech Month. During the month, members of hearing conservation teams, hearing aid dealers, audiologists, clinicians and physicians are urged to join with workers in speech therapy in activities that will acquaint the public with information about communications disorders and how they can be served.

There are three main objectives of the 1970 Better Hearing and Speech Month. They are: alerting the public to hearing, speech and language disorders; encouraging students to enter careers servicing the communicatively handicapped; and informing hearing and speech impaired persons about places where treatment and rehabilitation are available.

The Hearing and Speech Agency of Metropolitan Baltimore, Inc. is cooperating in all efforts to inform, educate and serve the community and those persons with communications disorders.

As part of this overall effort the Agency advises a hearing test for those persons with doubt about their hearing and urges all parents to have their children checked for hearing ability, if not before, surely when they are preparing the children for school for the first time. The Agency suggests that hearing is happiness—keep it healthy!

* * *

The Maryland Public Health Association is holding its annual meeting on May 21-22, 1970. Public health and mental hygiene representatives from around the state will meet in Baltimore at the Belvedere Hotel to discuss this year's theme: The Challenges of the 70's.

There will be panel discussions on drug abuse, healthful housing for the poor, accidental injury and death, and alcoholism. The meeting will also include section meetings on nursing, laboratory, environmental health, administration, social work, and speech and hearing.

Keynote speaker for the opening session will be the Rev. Frederick J. Hanna, Coordinator for Drug Abuses Program in Baltimore. Neil Solomon, MD, PhD, State Secretary of Health and Mental Hygiene, will be the guest speaker at noon on Thursday, May 21.

* * *

Ruth Finkelstein, MD, family-planning consultant for the Baltimore Maternity Center, has been appointed to the national medical committee of the Planned Parenthood Association.

Dr. Finkelstein has been a member of the medical board of the Planned Parenthood Association of Maryland. She also served as secretary for the AMA of Planned Parenthood Physicians.

A graduate of The Johns Hopkins School of Medicine, Dr. Finkelstein is attending physician in obstetrics and gynecology at Sinai Hospital in Baltimore, where she was honored in 1967 for 25 years of family-planning service.

* * *

Sister Alberta, DC, administrator of the St. Agnes Hospital, has announced the appointment of **Frederick J. Heldrich, Jr., MD,** as chairman of the Department of Pediatrics. His appointment marks the first time that the department has had a full-time chairman.

A graduate of Baltimore City College, and Gettysburg College in Pennsylvania, Dr. Heldrich received his MD degree from the University of Maryland School of Medicine. He served his internship and one year of his residency at University Hospital in Baltimore, and completed his residency at Mercy Hospital in Baltimore, where he served as chief resident in pediatrics.

Dr. Heldrich currently holds appointments as assistant professor of pediatrics at The Johns Hopkins School of Medicine, and as assistant professor of clinical pediatrics at the University of Maryland School of Medicine.

* * *

James Castellano, Jr., MD, of Woodlawn, has been named chairman of the Department of Obstetrics and Gynecology at St. Agnes Hospital.

Dr. Castellano received his BS and MD degrees from the University of Maryland and served both his internship and residency at St. Agnes Hospital.

A member of the Medical and Chirurgical Faculty, Dr. Castellano is also active in the AMA and the American College of Surgeons. He is a Fellow of the American College of Obstetricians and Gynecologists.

* * *

The American College of Gastroenterology, in cooperation with William H. Rorer, Inc., is sponsoring the 1970 Rorer Awards Contest for the best papers in gastroenterology. There will be two classes of awards: for the best unpublished papers in gastroenterology or an allied subject, and for the best paper published in the *American Journal of Gastroenterology* during the 12 months ending June 30, 1970, for which no previous prize has been awarded.

Deadline for entries is July 15, 1970. For further information, write to the Research and Education Committee, American College of Gastroenterology, 299 Broadway, New York, New York 10007.

* * *

A portrait of **Isadore A. Siegel, MD,** to be hung in Franklin Square Hospital, was recently unveiled in a ceremony honoring Dr. Siegel, who served as chairman of the hospital's Department of Obstetrics and Gynecology for 27 years.

Dr. Siegel graduated from The Johns Hopkins School of Medicine, and served his residency at The Johns Hopkins Hospital. He is a member of the Baltimore City Medical Society. He has served as director of obstetrics at Franklin Square Hospital, attending obstetrician at Sinai Hospital, and assistant professor of obstetrics at the University of Maryland School of Medicine.

* * *

George Patrick Bridger, MD, a Baltimore otolaryngologist, was among four resident physicians who presented papers in competition for the Benjamin Shuster Memorial Award at the sixth annual scientific meeting of the American Academy of Facial Plastic and Reconstructive Surgery, Inc. in Hollywood Beach, Florida in April.

The award was established by the Academy in honor of the late Benjamin Shuster, MD, of Philadelphia, and is presented for outstanding research in head and neck plastic surgery by a resident physician.

Dr. Bridger, a resident physician at The Johns Hopkins Hospital, spoke on "Physiology of the Nasal Valve".

* * *

Recently named representatives to the General Body of the Maryland State School Health Council are Robert J. Dawson, MD, of Cumberland, Julius Loebl, MD, of Annapolis, Martha T. Schipper, MD, of Frederick, and W. Lewis Holder, MD, of Rockville.

* * *

A. Earl Walker, MD, professor of neurological surgery at The Johns Hopkins University School of Medicine, recently attended a conference on the Prevention of Trauma and received an honorary FRCS degree from the Edinburgh Royal College of Surgeons in Edinburgh, Scotland.

* * *

The Division of Emergency Health Services of the Health Services and Mental Health Administration, formerly located in Chevy Chase, has moved its offices into the Public Health Service's new Parklawn Building in Rockville.

* * *

The Lower Eastern Shore Area Comprehensive Health Planning Agency has officially opened in Salisbury. It encompasses the Health Planning Council of the Lower Eastern Shore, and serves Dorchester, Somerset, Wicomico, and Worcester counties. Among the incorporating members are Mr. Norman W. Harrington, of Wicomico County, president; Calvin H. Webster, of Dorchester, vice-president; Dennett L. Butler, of Somerset, secretary; William C. Fritz, MD, of Somerset; Richard E. Hughes, MD, of Wicomico; and Frank E. Gantz, MD, of Worcester.

The agency, part of the State Department of Health and Mental Hygiene, is particularly concerned with consumer interest in health fields.

* * *

Harry B. Cummings, recently retired vice-president of Koppers Company, Inc. and general manager of the Metal Products Division, has been named president of the Board of Trustees of **South Baltimore General Hospital.** He succeeds Frederick W. Wagner, Jr.

Other newly-elected officers include Herbert A. Davis and Carlton E. Smith as vice presidents, Herbert R. O'Conor as secretary, and John A. Luetkemeyer, Jr., as assistant treasurer.

* * *

Herbert W. Lapp, MD, a Howard County physician and a member of the Faculty, was recently cited for his part in helping to capture two would-be thieves. He sustained three bullet wounds, smashed his car, landed in the hospital, and had to curtail his medical practice for two weeks as a result.

As he was backing his car out of the driveway one Saturday night in February, he noticed a rental truck parked in front of his neighbor's house across the street. Recalling several neighborhood burglaries in recent years, Dr. Lapp got out of his car, went over to the truck, and made a mental note of the truck's license number, intending to drive away and call the police. As he was getting back into his

car, however, he saw two men come leaping across the porch railing of his neighbor's house. Three shots were fired from the porch and hit Dr. Lapp. After a few seconds, he heard the truck's engine. Although he was still dazed from the bullet wounds in his arm and head, Dr. Lapp started his own car, shot ahead, and slammed into the truck, stalling the engine and causing the two men to flee on foot.

Meanwhile, the Howard County Police Department had received a call from another neighbor about the truck. As the men fled, Sgt. Burke, of the HCPD, and his men arrived at the scene. A chase followed, and one of the men was finally captured.

"I didn't intend to be a hero," said Dr. Lapp. "You don't know what you'll do until you're faced with such a situation."

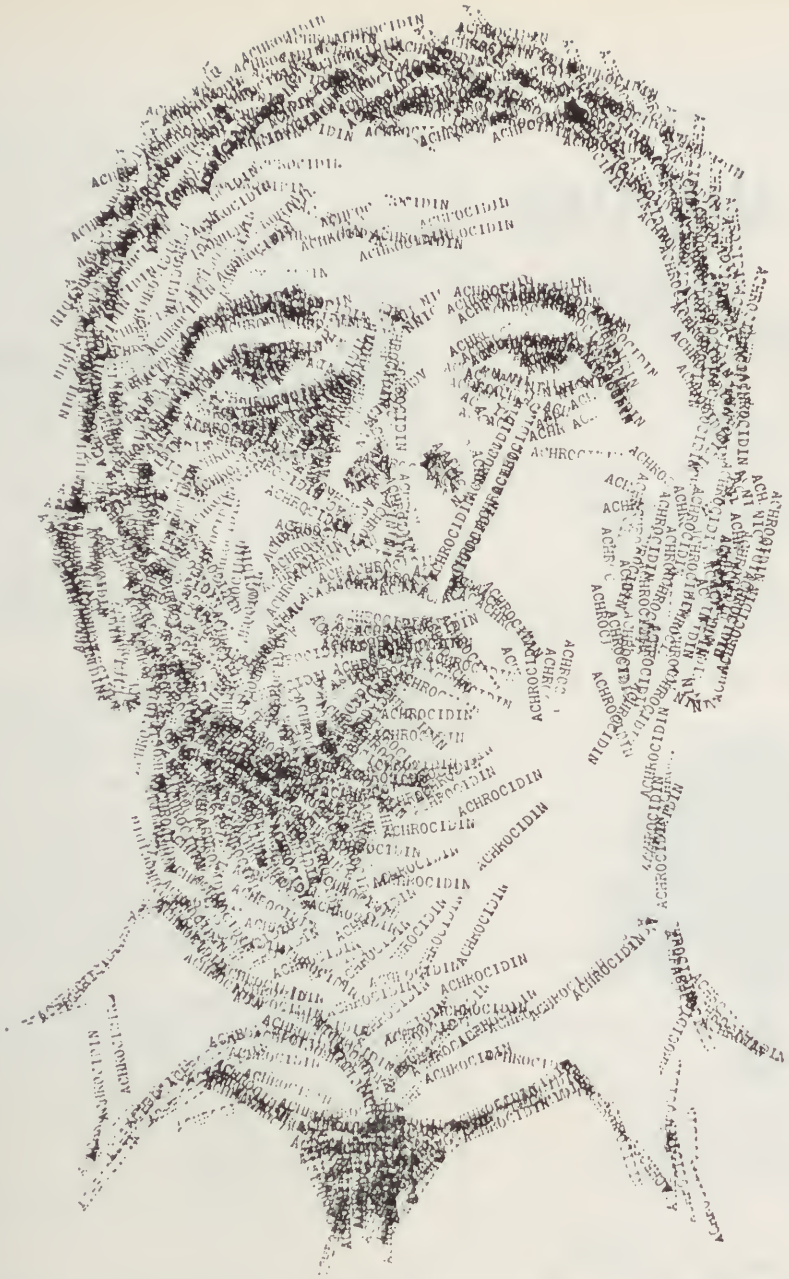
Sgt. Burke said, "He's quite a fantastic guy. You hear so much about apathy and then this happens."

* * *

The Professional Forum, an interdisciplinary Baltimore-based organization, has announced that it will provide key members as commentators on a filmed public affairs program to be produced by WMAR-TV for telecasting sometime in June, 1970.

The focus of the program will be on the separation of fact from fiction regarding the Medicare program; the erosion of traditional Constitutional processes; the future of the free enterprise system as it relates to medicine; how mounting crime patterns reflect the accelerated activities of the New Left; and how traditional Protestant and Catholic doctrine must meet the rhetoric of Leftist-leaning theology today. Respective speakers will be Newland E. Day, MD, vice president of the Forum; Thomas N. Clifford, attorney and specialist on federal and state constitutions; William E. Gilmore, MD, president and co-founder of the Forum; Jack Edward Rytten, criminologist, executive director of the organization and a co-founder; and the Rev. Robert C. Smoot, Jr., minister of Chapel Hill United Presbyterian Church and co-founder of the Forum.

Now in its fifth year, Forum members are bound together by mutual concern over the free enterprise system and how it functions in relation to government. According to Mr. Rytten, "If we eventually become a prototype for a national multiprofessional group it will be because all professionals finally realize that they share common standards and identical goals."



Forum members have been prominently featured on local radio talk shows in the last year, and have been guest speakers before many professional societies throughout the Baltimore area.

Professional people interested in joining the all-male group should contact Dr. Gilmore, Henry L. Wollenweber, MD, chairman of the Committee on Medicine, or Mr. Rytten at Professional Forum headquarters, 816 Munsey Building, Baltimore, Maryland 21202.

* * *

Officers of the Professional Forum (from left to right): Jack E. Rytten, criminologist, executive director (seated); Newland E. Day, MD, vice-president; and Howard E. DeMuth, Jr., attorney, secretary-treasurer, discuss the program entitled "Professional Opinion" to be telecast in June. Key members of the Forum will serve as commentators for the public affairs program.

Achrocidin® Tablets and Syrup

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen Citrate 25 mg.

ACHROCIDIN Tetracycline HCl—Antihistamine—Analgesic Compound Tablets and Syrup are recommended for the treatment of tetracycline-sensitive bacterial infection which may complicate vasomotor rhinitis, sinusitis and other allergic diseases of the upper respiratory tract, and for the concomitant symptomatic relief of headache and nasal congestion. For children and elderly patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN Tetracycline equivalent to Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15 mg.

Contraindications: Hypersensitivity to any component.

Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.

Precautions: Drowsiness, anorexia, slight gastric distress can occur. In excessive drowsiness, consider longer dosage intervals. Persons on full dosage should not operate vehicles. Nonsusceptible organisms may overgrow; treat superinfection appropriately. Treat beta-hemolytic streptococcal infections at least 10 days to help prevent rheumatic fever or acute glomerulonephritis. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).

Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity reactions*—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage.

Upon adverse reaction, stop medication and treat appropriately.

SYNOPSIS OF CERVICAL CANCER, Condict Moore, MD; The C .V. Mosby Company, St. Louis, Missouri, 1970.

This summary of clinical cancer information presents 20 years experience in learning, teaching, and practice in the field of oncology. It is very clearly written, concise, yet broad in scope. It includes very recent data, separates pertinent from trivial information, and emphasizes the similarities among the various cancers. In so doing, cancer is placed in better perspective within the field of medicine. This book is certainly worthwhile for every physician who is interested in cancer.

It is a handy review for both the student and the physician in all specialties of medicine and should prepare the reader for future discoveries in the emerging area of cancer prevention, which is destined to become an increasingly important part of medical practice.

SYNOPSIS OF OBSTETRICS, Charles E. McLennan, MD; The C. V. Mosby Company, St. Louis, Missouri, 1970.

This revised edition is designed primarily for the undergraduate medical student who needs an abridgment of the material included in the large standard obstetric textbooks, either for an initial survey of the subject or for a pre-examination review.

The emphasis has been placed on basic principles, and the ever-changing minutiae of drug therapy and mechanical procedures have been omitted. References to current literature are not included, since those reading a synopsis have little time to pursue original sources.

This is a useful reference text and one that should be made readily available to those in need of it.

THE VITREOUS IN CLINICAL OPHTHALMOLOGY, Norman S. Jaffe, MD; The C. V. Mosby Company, St. Louis, Missouri, 1969.

This book was compiled because of the numerous requests directed to the author for information on this subject. Dr. Jaffe is a distinguished lecturer, and teaches a course in this area at the Academy of Ophthalmology and Otolaryngology.

The book is geared to the resident and to the "eye man" in clinical practice, and provides a better framework for understanding the vitreous. A long list of credits to the many contributors who assisted in the preparation of the manuscript is given. A posthumous one goes to J. McGuiness Myers, the famed ophthalmic artist, who did most of the excellent drawings included in the book.

MANIC DEPRESSIVE ILLNESS, George Winokur, MD, Paula J. Clayton, MD, and Theodore Reich, MD; The C. V. Mosby Company, St. Louis, Missouri, 1969.

This soft-cover edition presents data on manic depressive illness collected over the course of many years by the authors. A set of clinical and genetic findings fundamental to the understanding of this illness is also offered.

It describes in some detail the various case histories of the individuals from which data was collected. It is a broad-range study of the entire spectrum of this particular aspect of psychiatric care. Supported in part by various grants from the National Institute of Mental Health, it is worthwhile reading for those involved or interested in this area.

SYMPOSIUM ON OCULAR THERAPY, Volume IV, Irving H. Leopold, MD; The C. V. Mosby Company, St. Louis, Missouri, 1969.

This publication presents the information given at the Drug Symposium of the American Academy of Ophthalmology and Otolaryngology and the Association for Research in Ophthalmology joint meeting held in Chicago in 1968. Each of the presentations is current and differs from those of earlier symposia.

The book is fundamental, practical where possible, and timely. While some areas of the symposium have been changed or modified in accordance with the speakers who participated, these changes only represent new thoughts which have developed since the last presentations were made.

The Presidents Speak

Mrs. Sadowsky Gives President's Report

Preparing my report as your 20th president prompts much reflection. The Medical and Chirurgical Faculty has chosen for its theme for this year's annual meeting "Medicine Looks to the '70's". It is hoped that as we approach our 21st year in this new decade, the Faculty, as it looks to the '70's, can depend on us as physicians' wives to brighten that outlook.

It has been a great honor for me this past year to have partaken in so many activities as your president. I feel very fortunate to have had the cooperation of dedicated officers, committee chairmen, and component auxiliary leaders. It is with pride that I shall give an account of their accomplishments in the second part of my report.

As your president, I have had the privilege and pleasure of visiting with all but one of the 11 component auxiliaries and installing officers for eight. I am very grateful for having had such an active refresher course in Maryland geography and to have received the hospitality of so many of our members in their own "backyard".

I have been privileged to attend national meetings such as the Annual Convention of the Woman's Auxiliary to the AMA in July in New York city, the Conference of Presidents and Presidents-elect in Chicago in October, the Eastern Regional Workshops in Washington in October, and the National AMPAC Workshop in Washington in February. As your presidential delegate to the national convention, I was proud to accept the membership award presented in recognition for "an outstanding membership program in 1968-1969". At the Conference in Chicago, I was a member of the cast presenting a skit on the use of a package program. At the Eastern Regional Workshop, I substituted for our Health Careers chairman who was unable to attend due to illness.

Since last spring, I have been the recipient of gracious hospitality when I accepted invitations from Pennsylvania, New Jersey, New York, Virginia, West Virginia, and D.C. medical auxiliaries for conferences and annual meetings. It is an inspiring and enlightening experience to witness the work of other state auxiliaries whose goals are so similar to our own.

I attended WA-SAMA's annual luncheon last April; lent a helping hand in the reception following the pre-Commencement exercises of the University of Maryland School of Medicine, where WA-SAMA members who were wives of graduates received certificates; and I attended WA-SAMA's regional convention in Baltimore a few weeks ago. Being with these energetic and youthful Auxiliary members of tomorrow, whom we help by extending counsel and financial assistance, always affords me much inspiration and encouragement.

I extended greetings from our auxiliary to the Future Nurses-Health Careers Clubs of Maryland at their state convention in Westminster last April. I have been asked to address the Spring Delegates Meeting of this same group when it meets at the Faculty building in Baltimore.

I have addressed the 7th District Nurses Association, explaining the purposes of the medical auxiliary, and the Woman's Auxiliary to the Allegany County Medical Society on the role of the auxiliary in community health services.

I have attended "coffees" for members-at-large in Anne Arundel, Howard and Frederick counties, all arranged by a very dedicated chairman whose ef-

forts have greatly increased the number of interested members-at-large.

I attended special fund-raising events in Montgomery County and Baltimore city for the auxiliaries' medical education funds. I accompanied Baltimore County auxilians on a trip to the Center in New Windsor, which has helped the auxiliary carry out its activities for international health.

In May, I represented you at the annual meeting of the Auxiliary to the Maryland Medical Association in Columbia, Maryland. In June, along with your Mental Health co-chairman, Mrs. Gerald Palmer, I attended the Maryland State Mental Health luncheon and meeting and in October, the Maryland State meeting of the American Cancer Society.

I have attended seven meetings of the Faculty's Program and Arrangements Committee, have assisted with arrangements for the Semiannual Meeting in Hershey, Pennsylvania, in September 1969, and organized an innovation in the program—Auxiliary Fun Night, a well-received evening of entertainment by members of the auxiliary and their families. I have advised the committee and concurred with its requests to plan an Art and Hobby Show for the Annual Meeting and to provide hostesses for the exhibitors at the Alcazar.

I conferred often with the Faculty's Executive Secretary to complete the membership project begun last year wherein the Faculty's president sent letters to those physicians' wives who were not auxiliary members in order to encourage membership in the auxiliary. With the cooperation and able assistance of county membership chairmen, I am happy now to report that this project gleaned 43 new members.

I prepared and edited articles for the Auxiliary Page of the *Maryland State Medical Journal* and proof-read the auxiliary newsletter *Hygeia Filiae*.

I have prepared agendae for, issued the call to, and presided over four Board meetings (having had the pleasure of entertaining the members at my Ocean City summer home for the first meeting), and one Executive Committee meeting. I conducted the Semiannual General Meeting in Hershey, Pennsylvania in September, where we were fortunate to have as guests the Eastern Regional Chairmen for AMA-ERF, Mrs. Wilson P. Smith, and Mrs. M. Bruce Martin, both of West Virginia, who were kind enough to conduct a sale of handmade ceramics to add to our AMA-ERF earnings. I anticipate presiding over the Annual General Session and President's Luncheon in Baltimore April 2. I plan to give the presidential report at the annual convention of the Woman's Auxiliary to the AMA in Chicago in June.

I have carried on much correspondence with state officers and committee chairmen, county presidents, and national officers. I have attended auxiliary committee meetings for planning the annual convention and for revising the Handbook. I have extended invitations to presidents and presidents-elect of our neighboring state medical auxiliaries, wives of Faculty guests, and participants in our Annual Meeting and Luncheon programs. I look forward to greeting our national president, Mrs. John M. Chenault, and many other guests who have accepted the invitation to be with us.

I have prepared the program for the Annual Meeting and in so doing, devised a new format, which I hope everyone recognizes as an improvement over the format heretofore used.

I now come to the second part of my report wherein I would like to acknowledge and express my appreciation for the wonderful accomplishments you, the membership, have realized. You and your dedicated committee chairmen and component presidents are deserving of loud applause.

Your conscientious AMA-ERF chairman has inspired you to raise a significant sum of money for medical education and research. Even though, at this writing, you have not quite matched the figure raised last year, I have every confidence that in the few weeks left before Annual Meeting, you will have surpassed last year's total. From our state auxiliary treasury, we have contributed to AMA-ERF in memory of our departed national officers and in memory of departed members of our state officers' families. I should like to express to the Faculty deep appreciation for the action taken to channel all funds collected from Maryland physicians through the auxiliary AMA-ERF chairman as of November 3, 1969. This will enable the Maryland auxiliary to compete on the same basis with other state auxiliaries credited with medical society donations. It is hoped that the Faculty's altruistic decision to relinquish the honor of presenting this fund at the AMA House of Delegates will encourage us to increase our own independent efforts to raise funds for our medical schools and the Loan Guaranty Fund. State awards will be based strictly on auxiliary earnings and will not take into account the more than $15,000 contributed by Faculty members, channeled through our auxiliary, and swelling our National Auxiliary Project Award Credit.

You are to be congratulated for expanding your programs for Children and Youth, for which a state committee was instituted last year. One county auxiliary has been exemplary in its involvement in its Child Development Council and work in the Family Life and Sex Education program. Many of you have been actively working with your schools and church groups, presenting programs on drug abuse and alcohol. You have displayed your interest by continuing the battle against violence in movies, TV and radio through letters and visitation to the State Board of Movie Censors; you have continued to work toward representation at the White House Conference. Our theme for the Annual Meeting is "Youth in the Soaring '70's" and we

look forward to hearing our keynote speaker, Matthew Debuskey, MD, Associate Professor of Pediatrics, The Johns Hopkins University School of Medicine, whose topic is "Generation Without Shadow".

You have responded superbly to the need for more medical and paramedical personnel in many ways. Over and above the financial help of $300 from our state auxiliary treasury allotted to the Future Nurses-Health Career Clubs of Maryland, scholarships and loans are provided by the auxiliaries of Baltimore, Montgomery, Prince George's, Washington, and Wicomico Counties. The Baltimore city auxiliary this year has presented five loans to students totaling $3,599. The Prince George's County Auxiliary presented three nursing scholarships totaling $1,600 and helped their medical society select winners for three more scholarships. The Allegany County auxiliary worked very diligently promoting the nine Health Careers Clubs in its county and in producing in cooperation with the Board of Education the second annual Health Fair held March 23, 1970. Harford County auxiliary has completed its slide presentation of medical and paramedical careers available in Harford County, along with a tape narration, and is presenting it to junior and senior high school students.

Many of you have promoted international health activities by extending hospitality to foreign medical personnel and by collecting sample drugs, books, used instruments, and clothing for overseas shipment. You have also continued to add to the list of interpreters for foreign speaking patients. This year, for the first time, in conjunction with our Annual Meeting, your state chairman for International Health Activities has planned an informative and entertaining evening on April 1 at the Belvedere Hotel.

Our auxiliary program this year concerned itself with the mental health of children. Our members have given financial support to mental hospitals and day care centers for retarded persons; provided transportation for patients to Mental Health clinics; contributed to "Operation Santa Claus"; given books, toys, tooth brushes, and tooth kits to institutions for mentally retarded; shown films to school children on drug abuse and alcohol; and supported their local Mental Health Associations. One auxiliary provided hostesses for the Mental Health Convention in Washington, D. C.

The interest of the auxiliary in legislation has not waned: Two component auxiliaries have traveled to Annapolis by bus to visit the Legislature and their local representatives. Another auxiliary visited with its county commissioners. Membership in MMPAC is always encouraged.

Action in community health services means recognizing the local community's needs and then doing something constructive about them, oftentimes in cooperation with other existing organizations. Our auxiliaries throughout the state have a fine record in carrying out community health services of a widely varying nature. These include participating in a Cardiac Symposium; mailing of tuberculosis Christmas seals; fighting air pollution and litter; cooperating with the Heart Association, American Cancer Society, hospital auxiliaries, and garden clubs; distributing poison control information, and staffing diabetic detection clinics.

Emphasis is constantly on increasing our membership. It is a well-known fact that the greater our number, the greater our effectiveness. Members-at-large have shown the greatest increase; much credit is due the state chairman who has arranged a "coffee" in each of the ten unorganized counties, where physicians' wives have a get-together and learn about the auxiliary, how through it they can work together to create a better image of American medicine and help foster favorable public sentiment.

We have had close rapport with the Woman's Auxiliary to the Southern Medical Association through our councilor and vice-councilor. It is noteworthy that several of our Maryland auxiliary members hold positions on the Southern Medical Auxiliary board. Since Doctors' Day is synonymous with the Southern Medical Association Auxiliary, our councilor will be happy to report that again this year we will have a record of participation by all of our county auxiliaries and many of our members-at-large. Governor Mandel's proclamation was secured and distributed widely. Besides many social functions to honor our physicians, AMA-ERF contributions were made, books were purchased, library displays were set up, and niceties extended to patients in many hospitals.

We have been fortunate to benefit from the expertise of an "almost professional" newswoman who as the editor of our newsletter, *Hygeia Filiae*, in the two issues this year has kept our members informed of our goals and accomplishments. Copies are also sent to the national officers and to leaders in the other 49 state medical auxiliaries. The Auxiliary Page in the *Maryland State Medical Journal* hopefully keeps the Faculty members abreast of auxiliary news.

Our archives have been kept current and we hope our hospitality has been ample. Due to the Baltimore newspaper strike, we have had to depend on local newspapers in smaller locales for publicity.

Due to the generosity of the Medical and Chirurgical Faculty, who has again contributed $1,000 to our working funds, we have not had to raise dues and our finances are in good order. We are indeed grateful to the Faculty for this expression of confidence in us.

Our convention chairmen have made superb arrangements for our 21st annual meeting. We are indebted to them and their committee. We are also

indebted to the Medical and Chirurgical Faculty for their continued counsel and assistance and to the staff, especially Miss Wynde, Mrs. Ritchie, and Miss Sowell for their capable assistance and advice.

I want to take this opportunity to acknowledge the pleasure I have had traveling with and conferring with your president-elect, Mrs. Raymond Yow. Getting to know her better has been one of the fringe benefits of the presidency. We are indeed fortunate to have someone as capable as Margaret to take the helm. I wish for her and her fellow board members a smoothly-running year of accomplishment.

May I express my appreciation to you, the members, for the confidence you placed in me and for the opportunity to have served the medical profession and the community in this honored capacity.

Mrs. Wallace H. Sadowsky
President 1969-'70

Mrs. Yow Named New Auxiliary President

Mrs. Raymond M. Yow

The honor conferred on me and Wicomico County today by installing me President of the Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland is deeply appreciated, and I approach my new office with pride and humility. It has been my privilege to have Mrs. Sadowsky as my mentor and guide this past year. Her friendship and advice has been, and will continue to be, most welcome to me.

My predecessors have had challenging themes during their tenure in office which fitted the times and needs of the Auxiliary. During the past year, Mrs. Sadowsky continued the national theme "Accent On Youth". The theme this year is "You, Your Community, And Our Youth".

Although we have entered the space age of the '70's, we are still faced with pots and pans, cleaning, and all the necessary and welcome duties of the homemaker. We, as auxiliarians, must continue to expand our individual horizons to encompass the needs of our own communities. We should take the initiative and help solve local problems. There is much truth in the axiom "Clean up your own backyard first". I am not suggesting that you are not already doing this. You are probably doing more than your share (if one can define the meaning and extent of share); but maybe you will find ways to encourage others to become involved in activities that benefit your area. Each locale has its own particular brand of problems and areas of need. All we can do to help is make every component Auxiliary aware of the programs that are available and that can be applied to the particular situation.

We have our youth soaring along on marijuana, glue, pep pills, LSD, and progressing finally to "hard line" drugs. But we also have an excellent package program on drugs and abuse that presents pertinent facts to a public that is only beginning to sense the depths of this tragic problem.

There are blood donor programs available almost everywhere. If your community doesn't have one, why not? And if it does, is it being supported? Use your talent to make Mr. and Mrs. Public understand and support the blood donor banks.

In the field of immunization, are you helping make the lives of all school children healthier? You don't have to be a nurse to help. There are other jobs concerned with this program that are just as important.

It is hoped that not too far in the future there will be audio and visual testing of young children. If and when this happens, scores of volunteers will be needed from the Auxiliary as well as other groups within the county.

We live in our communities, our husbands work hard in these communities. It would be nice if we could all participate and truly help meet the needs of our communities. There are package programs available. Use them.

As you know by now, the Bio-Medical Research Foundation has been closed and AMA-ERF is once again raising funds for student scholarships as well as helping medical schools. I do not plan to have a statewide participation project, such as Fun(d) day at the races this year. From the results of the past couple of years, I believe we have the message. I am asking you to stress your program in your

own county and to also continue to support the Christmas card sales. The state chairman will be ready to assist wherever possible. She needs but to be asked.

Encouraging our young people to enter a health career continues to be of vital importance. Be available to assist health careers clubs in your local schools.

The only way to have a successful program is to have an active membership. We always welcome new members, but somehow lose some old members along the way each year. Analyze your own organization and try to ascertain your weaknesses so that corrections can be made and all doctors' wives can be proud to belong to the Woman's Auxiliary. We have no room for petty differences or selfish motives. We are together because we have a mutual interest—we each represent medicine by merely being doctors' wives and no matter where we are, or what we say or do, someone is judging all doctors' wives by what they see in you and me.

Thank you for the honor you have bestowed on me. I will do my utmost to forward the aims and purpose of this organization and will represent you to the best of my ability.

Mrs. Raymond M. Yow
President 1970-'71

GRAM NEGATIVE SEPTICEMIA

Richard B. Hornick, MD
Assistant Professor of Medicine
Director, Division of Infectious Diseases
University of Maryland School of Medicine

Infectious diseases caused by gram-negative rods have been emerging as the most common type of hospital acquired infection, as well as the most difficult to treat. Previously, *E. coli* was the most common offender but in recent years, the incidence of this has dropped and has been replaced by Klebsiella species and less common organisms like *Serratia Marscius*. New sources of organisms like humidifiers have caused gram-negative rod respiratory infections. New trends in the management of these serious illnesses will be discussed.

Fast...long-lasting relief of aches and pains of colds and flu

with the unique timed-release aspirin

Double strength Measurin timed-release aspirin offers a new kind of control for your patients with cold and flu discomforts. In each 10-grain tablet are over 6,000 microscopic reservoirs that release aspirin at a controlled rate—some right away and some later on. This means fast relief of symptoms, followed by hours of comfort. Throughout the day, Measurin gives your patients freedom from a 4-hour aspirin schedule. During the night, its 8-hour dosage schedule holds the promise of sound sleep without awakening to take extra tablets.

MEASURI

TIMED-RELEASE ASPI

ECONOMICAL • EFFECTIVE • LONG LASTING PAIN R

Dosage: 2 tablets followed by 1 or 2 tablets every 8 hours as required, not to exceed 6 tablets in 24 hours. For maximum nighttime pain relief, 2 tablets at bedtime.

Available: Bottles of 12, 36 and 60 tablets.

IN G.U. THERAPY

Does not create problems...

SOLVES THEM

WITH FIRST DOSE PAIN RELIEF

Urised is a problem solver through its time tested record of minimal side effects. Unlike newer antibiotics or sulfonamides, Urised does not create problems. It brings patient comfort with first dose pain relief. For over 50 years, Urised has created physician and patient confidence by providing effective therapy when needed.

Clinically effective for G.U. Therapy[1-5]

URISED®

For G.U. Frequency – Urgency – Burning

- **CYSTITIS**
- **PYELITIS**
- **TRIGONITIS**
- **URETHRITIS**

Each blue-coated tablet contains active:

Atropine Sulfate	0.03 mg.	Methylene Blue	5.4 mg.
Hyoscyamine	0.03 mg.	Phenyl Salicylate	18.1 mg.
Methenamine	40.8 mg.	Benzoic Acid	4.5 mg.

Caution: Federal law prohibits dispensing without a prescription.

Action and Uses: Urised is effective in cystitis, pyelitis, trigonitis In pregnancy, urethritis, and other urinary tract infections where the invading organisms, such as E. coli, S. aureus and albus, are susceptible to methenamine and methylene blue in an acid medium.

URISED also is useful as a prophylactic measure prior to urinary tract instrumentation or operation. In acute fulminating infections, URISED may be used for symptomatic relief while awaiting specific laboratory diagnosis. May be combined with specific therapy where indicated.

Effects: Rapid relief of pain, relaxation of smooth muscle spasm through parasympatholytic action of atropine and hyoscyamine; pus cell content decreased.

Administration and Dosage:

Adults: Two tablets, orally, four times per day, followed by liberal fluid intake.

Children: One-half the adult dose.

Acute cases: Initially two tablets every hour for three doses, followed by the recommended daily administration.

Precautions: Administer with caution to persons with known idiosyncrasy to atropine and cardiac disease. While under this therapy the urine is blue; patients should be so advised to allay apprehension.

Side Effects: Neither irritation nor untoward reactions have been reported; however, if pronounced dryness of the mouth, flushing, or difficulty in initiating micturition occurs, decrease dosage. If rapid pulse, dizziness or blurring of vision occurs, discontinue use Immediately. Acute urinary retention may be precipitated In prostatic hypertrophy.

Contraindications: Glaucoma, urinary bladder neck or pyloric obstruction, duodenal obstruction and cardiospasm. Hypersensitivity to any of the ingredients.

How Supplied: Bottles of 100, 500 and 1,000 tablets.

Emergence of Gram-Negative Pharyngeal Flora in Hospitalized Patients

Rise in gram-negative flora in the pharynx correlated much more closely with severity of illness than with hospital exposure. Concomitant diminished clearance of bacteria among the critically ill suggests mechanism of pathogenic infiltration of the lungs.

Pneumonia due to gram-negative bacilli still poses a major threat to hospitalized patients. Numerous investigations into the spread of nosocomial bacterial pneumonia have failed to uncover a pathogenic flora unique to a hospital setting, or to identify common pathogens in the hospital environment. These findings suggest that the infecting agents are endogenous to the patient.

Most pathogens probably migrate from the oropharynx into the lungs. Mechanism of entry may be by aspiration of pharyngeal fluid into the lungs. This phenomenon is known to occur in healthy persons during sleep. Thus, gram-negative bacilli in the oropharynx could possibly serve as a harbinger of nosocomial pneumonia.

The present study was undertaken to ascertain the prevalence of gram-negative bacilli in the oropharynx of normal subjects and hospitalized patients with illnesses of varying severity.

Five groups of adult subjects were selected for study. These included 82 nonhospital-associated normal subjects (firemen), 47 hospital-associated normal subjects (physicians and hospital-ward personnel), and 20 physically normal hospitalized psychiatric patients. Also included were 81 moderately ill hospitalized patients on the orthopedic-surgery service and 23 critically ill patients on the medical service. None of the normal subjects had received antibiotics for two weeks before the culture period.

Oropharyngeal cultures were obtained with an area-sampling device, and the isolated pathogens identified by standard technics.

Colonization of Bacilli

On the first culture, prevalence of gram-negative bacilli was shown to be the same (2%) for the nonhospital and the hospital-associated subjects despite a gradation in exposure to the hospital environment from none to intermittent. No bacilli were isolated from the 20 hospitalized psychiatric patients.

At the same time, prevalence of gram-negative bacilli was striking for the moderately ill (16%) and for the severely ill (57%).

Repeated cultures, however, showed a cumulative percentage rise for all five groups, including a 6% rate of positive cultures for the psychiatric group. Throughout the study, a wide divergence prevailed between physically normal and sick subjects. Cumulative percentage of positive cultures rose to only 6% for normal subjects, in contrast to a high of 35% for the moderately ill and 73% for the moribund. Overall percentage of positive cultures in each group remained essentially the same.

This study showed some correlation between the rise in gram-negative bacilli and exposure time in the hospital environment. Much more pronounced, however, was a correlation between the prevalence of pathogens and severity of illness. Nineteen per

Waldemar G. Johanson, MD; Alan K. Pierce, MD; and Jay P. Sanford, MD. *The New England Journal of Medicine* (Vol. 281, No. 21), November 20, 1969.

cent of moderately ill and 55% of moribund patients had positive cultures within 96 hours of admission. Frequency of Serratia and Proteus genera of bacteria was much lower for the moderately ill than for the moribund. Serratia was isolated in one (1%) of the moderately ill and nine (26%) of the moribund; Proteus, in none of the moderately ill, but in eight (24%) of the moribund.

Bacilli on the Move

Several studies reveal that bacteria in the upper respiratory tract frequently migrate into the lung. Pneumococci instilled in the nose of nonanesthetized rabbits appeared in the lung within minutes. When tracheobronchial clearance is impaired in dogs after a bronchus has been occluded with a piece of sterile cotton, pharyngeal organisms can be readily recovered distal to the occlusion.

In human studies, bronchoscopic specimens taken from the bronchi of a normal person usually are sterile on culture, while specimens from a person with bronchopulmonary disease contain pharyngeal flora.

Furthermore, autopsies have established that bacterial flora in the pharynx may also be found in the lungs. Whereas this finding has been attributed to agonal aspiration of pharyngeal content, it can just as reasonably be attributed to terminal failure of the clearance mechanism.

Previous studies have revealed that gram-negative bacilli are not frequently found in the pharyngeal cultures from normal subjects. The present study has shown that to be the case while emphasizing that the prevalence of gram-negative bacilli among sick patients is strikingly increased.

Intense exposure of the respiratory tract to gram-negative bacilli may occur when contaminated aerosols are generated by inhalation therapy equipment. However, some studies show that even under these circumstances only a small percentage of persons exposed become colonized, and necrotizing pneumonia due to gram-negative bacilli is infrequent. Furthermore, massive exposure of normal subjects to these organisms does not result in colonization of the upper respiratory tract.

During the course of this study some aerosol medications were found to be contaminated with Serratia. Colonization did not occur in the ten moderately ill patients who received these medications, but did occur in six of 18 moribund patients who received the same medication. Environmental contamination with other bacilli was not demonstrated and the observed prevalence of bacilli in pharyngeal cultures could not be explained on this basis.

Some studies suggest that antibiotics remove a major barrier to gram-negative colonization by suppressing the normal pharyngeal flora, which may suppress the growth of nonresident species. In this study, however, antibiotic therapy appeared to have no significant effect.

Of all the factors examined, appearance of gram-negative flora correlated most closely with clinical severity of illness. These findings suggest that the ability of sick patients to remove or clear exogenous bacteria from the pharynx is impaired. Susceptibility to gram-negative bacterial pneumonia may be increased by such colonization of the pharynx alone. More likely, it is enhanced by a concomitant impairment in pulmonary clearance mechanisms as well.

I love my family.
I adore this house.
My in-laws are great.
The neighbors are wonderful.

Indications: For use in management of anxiety and tension occurring alone or as accompanying symptom complex to medical and surgical disorders and procedures. Though not a hypnotic, fosters normal sleep through antianxiety and related muscle-relaxant properties.

Contraindications: History of sensitivity to meprobamate.

Important Precautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use has been reported to result in dependence or habituation in susceptible persons, as alcoholics, ex-addicts, and other severe psychoneurotics. After prolonged excessive dosage, reduce dosage gradually to avoid possibly severe withdrawal reactions. Abrupt discontinuance of excessive doses has sometimes resulted in epileptiform seizures.

Warn patients of possible reduced alcohol tolerance, with resultant slowing of reaction time and impairment of judgment and coordination.

Reduce dose if drowsiness, ataxia or visual disturbance occurs; if persistent, patients should not operate vehicles or dangerous machinery.

Side Effects include drowsiness, usually transient; if persistent and associated with ataxia, usually responds to dose reduction; occasionally concomitant CNS stimulants (amphetamine, mephentermine sulfate) are desirable. Allergic or idiosyncratic reactions are rare, but such reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Previous history of allergy may or may not be related to incidence of reactions. Mild reactions are characterized by itchy urticarial or erythematous maculopapular rash, generalized or confined to groin. Acute nonthrombocytopenic purpura with cutaneous petechiae, ecchymoses, peripheral edema and fever have been reported. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically as with epinephrine, antihistamine and possibly hydrocortisone. Aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia have occurred rarely, almost always in presence of known toxic agents. A few cases of leukopenia, usually transient, have been reported on continuous administration.

Meprobamate may sometimes precipitate grand mal attacks in patients susceptible to both grand and petit mal. Extremely large doses can produce rhythmic fast activity in the cortical pattern. Impairment of accommodation and visual acuity has been reported rarely. After excessive dosage for weeks or months, withdraw gradually (1 or 2 weeks) to avoid recurrence of pretreatment symptoms (insomnia, severe anxiety, anorexia). Abrupt discontinuance of excessive doses has sometimes resulted in vomiting, ataxia, tremors, muscle twitching and epileptiform seizures. Prescribe very cautiously and in small amounts for patients with suicidal tendencies. Suicidal attempts have resulted in coma, shock, vasomotor and respiratory collapse and anuria. Excessive doses have resulted in prompt sleep, reduction of blood pressure, pulse and respiratory rates to basal levels, and occasionally hyperventilation. Treat with immediate gastric lavage and appropriate symptomatic therapy. (CNS stimulants and pressor amines as indicated). Doses above 2400 mg./day are not recommended.

Composition. Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. (All tablets also available in REDIPAK® (strip pack). Wyeth.) Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

The young homemaker: her underlying anxiety and tension can surface and intensify under the continuous stress of rearing a growing family. Especially when she's confined to the home and its environs so much.

You can help her over the rough spots with reassurance and counsel. Equanil can help relieve tension, ease anxiety—with little risk of serious side effects. Time and experience will probably do the rest.

Catalog Revisions

The spring meeting of the Medical and Chirurgical Faculty came early this year, unlike the season itself. And, as happens every year, the titles the physicians want seem frequently to just happen to be those in circulation, or those left at the library, or those that this library does not own. Try as we do, we cannot hit the nail on the head every time. Our greatest aspiration is that every Faculty member attending the annual meeting would visit the library booth to browse and get acquainted with the staff and the services the library offers.

* * * * * *

Since February, with the addition of Mrs. Judith Pochciol to the library staff, our card catalog has become a 'divided' catalog, with authors and titles in one section and subjects in the second section. The catalog has grown through years of varying systems of cataloging and classifications (now three —Noyes, LC, and NLM) and many discrepancies showed up during this process. Subject cards were typed as if titles and vice versa, adding immeasurable difficulty to the sorting procedure. Flagrant differences were corrected during the change-over, and notes were made to return to areas needing extensive revisions. This entire operation was a big step toward cleaning up the catalog, pointing up the lack of cross references, discovering the need for chronological arrangement of many subjects, and giving us a good overall look at the catalog as a library tool.

With this chore accomplished, we can now proceed with the normal tasks of book selecting, ordering, and cataloging which have been somewhat limited for the past five or six months. However, since there was no increase in budget this year, activities will be further restricted in a number of areas. The compiling of bibliographies will necessarily be curtailed greatly due to lack of adequate staff. This in turn will mean that physicians will have to use the library facilities personally to search Index Medicus, Excerpta Medica, and other literature sources. The alternative will be that the searching will be done by an outside paid literature searcher, the physician's secretary, or a library staff member for a fee (except at present there is no staff member available!).

History of Medicine

In the course of his extensive weeding of the stacks, our consultant, Lee Ash, recently drew our attention to two unusual volumes published in London in 1825. These are the *Collections From the Unpublished Medical Writings of the late Caleb Hillier Parry, MD, F.R.S.,&c.*

There are five entries for Parry's writings in Garrison and Morton's bibliography of the classic works of medicine (1954), and among them three references to this set: First (G/M2210), to the set itself, which is very scarce. Mr. Ash recalls having seen it very seldom in 30 years' experience (curiously, Welch Medical Library also has a set). Second (G/M3813), which is "a classical account of exophthalmic goitre. Although Graves and Basedow have both been credited with the first description of the condition, giving their names to it, Osler has called attention to the priority of Parry's claim . . ."; third (G/M4522), cites Parry's as the first to record cases of facial hemiatrophy. In 1816 Parry wrote on the causes and varieties of arterial pulse (G/M2742), and earlier, in 1799, had published his *Inquiry Into the Symptoms and Causes of the Syncope Anginosa, Commonly Called Angina Pectoris,* originally read as a paper in 1788, a truly remarkable scientific work (G/M2888), "concluding that disease of the coronary arteries is the responsible factor in angina pectoris. He was the first to observe the slowing of the heart rate following pressure on the carotid artery". The library does not have the book on arterial pulse, but the other volumes make fascinating reading for the clinician.

NEW ACCESSIONS—BOOKS

(Arranged by author and title)

Advances in biomedical engineering and medical physics. v. 1- 1968- . New York, Interscience Publishers.

Albert, Adrien
Selective toxicity and related topics. 4th ed. London, Methuen, 1968.

American Public Health Association. Program Area Committee on Child Health.
Services for children with communicative disorders; a guide for public health personnel. Prepared jointly by the Program Area Committee on Child Health of the American Public Health Association and the Children's Bureau, Social and Rehabilitation Service, Dept. of Health, Education, and Welfare. New York, 1967.

Baumrucker, George O.
TUR: transurethral prostatectomy; technique, hazards, and pitfalls. Baltimore, Williams & Wilkins, 1968.

Brazier, Mary A. B.
The electrical activity of the nervous system: a textbook for students. 3rd ed., Baltimore, Williams & Wilkins, 1968.

Burford, Thomas H.
Cardiovascular surgery; current practice. v. 1- . Ed. Thos. H. Burford and Thos. B. Ferguson. St. Louis, Mosby, 1969-.

Burian, Frantosek
The plastic surgery atlas. New York, Macmillan, 1968.

Cameron, Donald E.
Psychotherapy in action. New York, Grune & Stratton, 1968.

Clarke, E. G. C., ed.
Isolation and identification of drugs in pharmaceuticals, body fluids and postmortem material. London, Pharmaceutical Press, 1969.

Cureton, Thomas K.
The physiological effects of exercise programs on adults. Springfield, Ill., Thomas, 1969.

DeLand, Frank H.
Atlas of nuclear medicine. By Frank H. DeLand and Henry N. Wagner, Jr. With the assistance of Wendy A. North. Philadelphia, Saunders, 1969.

Donlon, Thomas F.
Development of the brief test of literacy; a description of the development of a new test of literacy capable of providing information concerning the prevalence of illiteracy in large sample populations. By Thos. F. Donlon, W. Miles McPeek, and Lois R. Chatham. Washington, U.S. Dept. of Health, Education, and Welfare, Public Health Service, 1968.

Douglas, Adrian P.
A short textbook of kidney disease. By Adrian P. Douglas and David N. S. Kerr. Philadelphia, Lippincott, 1968.

Drugs of choice, 1970. St. Louis, Mosby. W. Modell, Ed.

Early, Paul J.
Textbook of nuclear medicine technology. By Paul J. Early, Muhammad Abdel Razzak, and D. Bruce Sodec. St. Louis, Mosby, 1969.

Froelich, Robert E.
Medical interviewing; a programmed manual. By Robt. E. Froelich and F. Marian Bishop. St. Louis, Mosby, 1969.

Gastrointestinal radiation injury; report of a symposium held at Richland, Wash., Sept. 25-28, 1966. M. F. Sullivan, Ed. Amsterdam, Excerpta Medica Foundation, c1968.

Gasul, Benjamin M.
Heart disease in children; diagnosis and treatment. By Benjamin M. Gasul, René A. Arcilla, and Maurice Lev. Philadelphia, Lippincott, 1966.

Gradwohl, Rutherford B. H.
Gradwohl's legal medicine. 2d ed. Ed. Francis E. Camps, with assistance by members of the Dept. of Forensic Medicine, London Hospital Medical College. Bristol, Wright, 1968.

Haas-Posthuma, J. H. de
Infant loss in the Netherlands. By J. H. de Haas-Posthuma and J. H. de Haas, Washington, U.S. Public Health Service, 1968.

Hardin, James W.
Human poisoning from native and cultivated plants. By James W. Hardin and Jay M. Arena, Durham, N. C., Duke University Press, 1969.

Health Insurance Institute
Source book of health insurance data. New York, 1969- .

Holman, Emile
Abnormal arteriovenous communications; peripheral and intracardiac, acquired and congenital. 2nd ed. Springfield, Ill., Thomas, 1968.

International Conference on Malnutrition, Learning and Behavior, MIT, 1967. **Malnutrition, learning, and behavior; proceedings.** Ed. Nevin S. Scrimshaw and John E. Gordon. Cambridge, M.I.T. Press, 1968.

Dear Sir:

I want to compliment you upon the recent changes in the *Maryland State Medical Journal* under your editorship. The covers by local artists are most attractive. The Table of Contents is impressive in appearance as are the format and articles, as well as the content of the items of medical interest.

The Journal has come a long way in recent years, and I am pleased to see it continue to progress under your supervision.

Sincerely,
Sidney Schleris, MD

Newer Concepts in Bundle Branch Block

ROBERT R. MONTGOMERY, MD, FACC
Bethesda

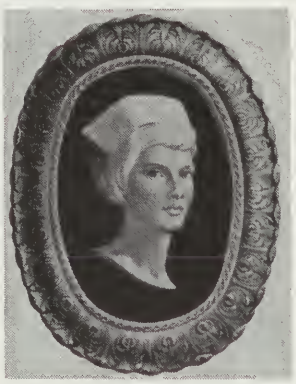
Recently, several investigators have demonstrated that there are actually three major branches of the bundle of His. These are the right bundle and two major divisions of the left—anterior and posterior. Conduction may be impaired or blocked along any of these fascicles and such abnormalities may be transient or permanent.

Complete block of all three fascicles (trifascicular block) closes all avenues of conduction between the atria and ventricles. This produces complete A-V block with the pacemaker driving the ventricles located distal to the bundle branches (idioventricular). This differs from complete A-V block due to disease in the A-V node or in the junction between the atria and A-V node in one major respect; namely, that nodal block allows escape of a nodal pacemaker to drive the ventricles, whereas trifascicular block demands that a lower, ventricular pacemaker drive the ventricles. The usual rate of nodal pacemakers is between 40 and 60, whereas the rate of ventricular pacemakers is often in the 20's or 30's. Hence, the heart rate is usually slower with trifascicular block. We now recognize that many cases of complete A-V block actually represent trifascicular block, especially those cases in which the ventricular rate is very slow with cerebral (syncope), renal, or cardiovascular (congestive failure) evidence of inadequate cardiac output. These cases are usually unresponsive to pharmacologic attempts at increasing the heart rate, and require pacing.

Trifascicular blocks present characteristic electrocardiographic changes. Complete block of the right bundle alone, for example, produces the well-known picture of right bundle branch block. Block of both divisions of the left branch gives classical left bundle branch block. Block of the anterior division of the left bundle (anterior hemiblock) produces abnormal left axis shift; block of the posterior division (posterior hemiblock), abnormal right axis shift. Combinations can also be recognized: Right bundle branch block with left axis shift signifies RBBB and left anterior hemiblock, right bundle branch block with right axis shift signifies RBBB and left posterior hemiblock. (In identifying these patterns, use the first 0.08 to 0.10 seconds of the QRS to determine the electrical axis.)

The PR interval must be considered, as well as the QRS, in full evaluation of trifascicular blocks, since it will reflect the status of conduction through the remaining fascicle if two are blocked. That fascicle will then represent the only communication between atria and ventricles. If conduction through it is normal, there should be no delay in atrioventricular conduction, and the PR interval will be normal (if there is no coexisting disease in the A-V node itself). If, however, conduction through this third fascicle is impaired, then there will be delayed conduction between the atria and ventricles, and the electrocardiogram will show a prolonged PR interval. As conduction through this remaining fascicle is progressively impaired, the PR interval will become progressively longer. If conduction becomes completely blocked, there will then be complete A-V block. Hence, in a patient with right bundle branch block, left axis shift, and first degree A-V block, we may conclude that there is block in the right bundle and in the anterior division of the left bundle along with impaired conduction in the posterior division of the left bundle or in the A-V node itself.

Recognition of these various types of trifascicular



block is of greatest importance in two classes of patients: first, those with acute myocardial infarction; and second, older patients with syncope. Both groups of patients tolerate low cardiac output very poorly. Output is a product of stroke volume and heart rate; hence, slower rate demands larger stroke volume to maintain constant output. These patients, however, often do not have the ability to increase stroke volume satisfactorily; so if rate falls enough, output may become inadequate. Such slow rates accompany complete trifascicular block. Hence, if we can foresee the development of complete block during the progress of trifascicular block, we can prevent the slow rate by instituting demand pacing. For instance, a patient with anterior myocardial infarction who develops right bundle branch block with left axis shift (left anterior hemiblock) is then conducting only through the left posterior fascicle. Any further septal damage might impair conduction there too, first producing PR prolongation, then complete A-V block with a slow ventricular rate. Hence, we would introduce demand pacing as a prophylactic measure. We have seen this progression occur in a matter of minutes in some patients, so we institute demand pacing as soon as we recognize involvement of two of the three fascicles. We have found that waiting for involvement of the third (PR prolongation) has occasionally turned a serious situation into an extremely dangerous emergency.

In older patients with syncope, evidence of block of two of the three fascicles implies that if conduction fails intermittently in the third, there will be a sudden drop in heart rate with a drop in cardiac output. This mechanism appears to be the cause of a progressively larger percentage of Stokes-Adams attacks as we learn more about recognizing it. In this situation, any prolongation of the PR interval is an indication for demand pacing. If vagal stimulation causes more change in the PR interval or produces a higher grade of A-V block, demand pacing should be undertaken promptly.

In summary, we are now armed with the knowledge that there are actually three major divisions of the bundle of His, that conduction may be blocked in any one, two, or all three, that conduction may be impaired as well as completely blocked, and that these conduction abnormalities may be (usually are) intermittent. Disturbances in the conduction through these three divisions is referred to in current medical literature as "trifascicular block". We are learning to recognize the electrocardiographic representation of various forms of trifascicular blocks, and are recognizing their clinical implications.

Summary of Reported Poisonings in Baltimore City, 1969 and 1968

The following tables summarize poisonings in Baltimore as reported by 22 accident rooms of Baltimore hospitals and pediatric clinics. This report is made possible through a poison control ledger system maintained by the Bureau of Food Control in the Baltimore City Health Department and cooperating medical units. The figures in the tables are exclusive of poisonings treated by physicians in home and office visits or those treated at home, or those that received no treatment at all.

Table 1: TOTAL POISONINGS 1969 AND 1968 AS REPORTED BY 22 BALTIMORE HOSPITALS AND CLINICS

	1969	1968	Change
Total Cases	4,285	3,775	+ 510
Total Deaths	67	43	+ 24
Cases by Categories of Substances			
Internal Medicines	2,787	2,555	+ 232
Household Preparations	983	840	+ 143
External Medicines	108	108	None
Plants	67	30	+ 37
Gases	37	18	+ 19
Veterinary Medicines	16	7	+ 9
Miscellaneous	287	217	+ 70

Table 2:

INTERNAL MEDICINE

POISONINGS 1969

Aspirin	852
Sedatives	849
Narcotics	178
Stimulants	22
Psychopharmaceuticals	20
All Others	666
TOTAL	2,587

Table 3: POISONINGS FROM HOUSEHOLD PREPARATIONS 1969

Cleaning Products (oven, drain, bowl cleaners)	201
Washing Products (soaps, detergents)	180
Pesticides (rodent, insect, weed killers)	170
Paints, Lacquer, Solvents (turpentine, thinners, paints)	146
Petroleum Products (lighter fluid, gasoline)	105
Cosmetics (lotions, creams, mascara)	111
Polishes (furniture, metal polishes)	70
TOTAL	983

Table 4:

POISONINGS BY AGE GROUPS 1969 AND 1968

Age Group	1969	1968	Change
Under 1 year	69	69	None
1-4 years	2,295	2,169	+ 126
5-14 years	272	205	+ 67
15-24 years	755	588	+ 167
25 and over	781	669	+ 112
Age unknown	113	75	
TOTAL	4,285	3,775	

As noted above, internal medicines are the major poisoners, and children are the chief victims. Aspirin is still the single chief offender. Cases of aspirin poisonings reported in 1969 totalled 852, or a total of 76 fewer cases than 1968.

Also noted is a rise of 174 cases in drug abuse poisonings—1,069 reported in 1969 compared with 895 in 1968. These poisonings include sedatives, narcotics, stimulants, and psychopharmaceuticals. While poisoning deaths for Baltimore city numbered 67, as noted in Table 1, a total of 59 persons died of overdoses of narcotics or sedatives. This represented 19 more deaths from these causes in 1969 than in 1968.

Poison prevention educational materials are available from the Bureau of Health Information, telephone 752-2000, extension 843. A city-wide educational effort, alerting the public to accidental poisonings and their prevention, was conducted in March during National Poison Prevention Week. The Poison Prevention Committee is comprised of representatives of the Baltimore City Medical Society, the Medical and Chirurgical Faculty, the Maryland Academy of Pediatrics, the Maryland Pharmaceutical Association, the Baltimore Safety Council, the U.S. Food and Drug Administration, the Baltimore City Health Department, and the Maryland State Department of Health.

The Pharmacological Approach To Alcoholism—*Part 2*

STANLEY E. GITLOW, MD
Associate Clinical Professor of Medicine
Mount Sinai Medical School
New York

Now let us consider the nature of addiction. Addiction is a circumstance in which a drug has been utilized and is now gone from the body, but has resulted in an organic, measurable, overt disease state, a condition which demands more of the drug in order to get relief. This does not necessarily mean the individual is habituated or emotionally dependent, but just that he is measurably sick after the drug is gone, and he requires more of it for relief. Alcoholism was for years mistakenly considered to be an habituation, but alcohol is a true addicting substance, as is every one of the aliphatic sedatives or soporifics. Now what is cross-addiction? This simply means that among this group of sedative drugs, I can replace one with any other at any time. I can replace alcohol with phenobarbital, phenobarbital with pentothal, pentothal with paraldehyde, paraldehyde with chloral hydrate, and if I adjust the dosage correctly and give it parenterally, the individual will probably not know which he is getting, because the effect upon the brain is almost identical. Hence, there is cross-addiction among the different members of this group of compounds, but there is not cross-addiction between these and narcotics. Both sedatives and narcotics are capable of addicting but these addictions are separate disease states. **Of course, one individual can become addicted to both groups of compounds, but this is rare. We don't know why, but it is unusual to find an alcoholic who is also a narcotic addict, or vice versa.**

The withdrawal state from narcotic drugs is less severe than withdrawal from sedatives. Addicted individuals rarely, if ever, die from narcotic withdrawal, whereas death from alcohol (or other sedatives) withdrawal is quite common. Secondly, an individual who is taking a new dose of sedative to control the psychomotor agitation caused by yesterday's intake is not a well-functioning human being. He is either close to sleep or he is very uncomfortable and functioning poorly. On the other hand, if narcotics are given to the narcotic addict to stop the withdrawal syndrome, he can function and he need not continue to increase psychomotor activity. A narcotic addict can be maintained on a stable amount of drug for years and can function all during that period of time. Thus, **the narcotic addict can maintain a plateau, whereas the alcoholic, due to the pharmacology of his drug, is compelled to reach beyond, losing functional capacity in the process.**

Now I would like to discuss tolerance. Suppose you take ten drinks and I take ten drinks, and within an hour I am lying asleep on the floor and you are walking around as though nothing happened. This

means that you are more tolerant of the pharmacologic effects of alcohol than I. Thus, tolerance accounts for variability of effect relative to a single dosage of a drug. There are individual differences in the rapidity with which alcohol is metabolized. In addition, if we look at one individual over his lifetime, we will find that his tolerance diminishes with age. For example, if an alcoholic is abstinent for ten years and then relapses, he will get much sicker, with less alcohol intake, than he used to. The difference is simply that his body and especially his brain are ten years older, and every year his tolerance for alcohol decreased, even though he wasn't drinking. From this point of view, **alcoholism is a self-limiting disease because with diminishing tolerance, the amount the alcoholic can drink eventually is very little and the amount of suffering he does for it is very great.** In most instances, sooner or later, the disease either kills or the alcoholic decides to stop drinking. Our job is to try to convince him to quit before it seriously disables him.

So far, we have discussed true tolerance, tolerance to both the sedative and the agitating effects of alcohol. There is another phenomenon often described as tolerance, which refers to current sedation being countermanded by agitation from past drinking, and which really is not tolerance at all. Take, for example, an alcoholic who is drinking a quart a day, and give him ten or twelve drinks. You or I would be lying on the floor, but he is not even sleeping. His psychomotor activity level from past drinking is very high and he can take a heavy load of sedation that will give him a relatively normal psychomotor level. He demonstrates the two opposite pharmacological effects of alcohol operating together, and such individuals will not infrequently be found walking around with blood alcohol levels above 0.5%, which is usually considered to be within the lethal range. These people may be driving a car, walking around, talking for hours on the telephone—but with one difference: Tomorrow they may be amnestic about the event. This is called a blackout, and people get these quite soon after they become alcoholics. Yet, there is already a considerable amount of dysfunction, of illness, in a brain which achieves a "blackout" state. It isn't that the individual forgets what he was doing; even when he was doing it, his consciousness was clouded and he did not consciously "know" what he was doing.

I want to distinguish between alcohol addiction and alcoholism, for they are not the same. One is a pharmacological term, the other a medical term for a disease state (and as indicated before, it really should be "sedativism" rather than "alcoholism"). I can produce alcohol addiction in any one of you by giving you ten drinks today, twenty tomorrow, twenty the next day and the next, and so on until I stop the alcohol and you start having seizures. You are in a withdrawal state, alcohol addicted, but that does not make you an alcoholic. The *sine qua non* of alcoholism is that the individual goes back and does it again and again, even though he suffers loss of job, loss of health, loss of family. **The definition of the disease includes not just addiction, but compulsivity.** Now why, when he suffers so much, does he do it again and again? Because he is compelled to, but not primarily because of the suffering that goes with it. He would like to find a way of avoiding the suffering and not infrequently will come to the physician asking for sedative medication that will prevent the suffering. The reasons for the compulsion to drink may be psychological. I used to think that, but now I am not so sure. These individuals may have a different psychomotor activity level on a biochemical basis. The norm for them may be higher than that for other people because of a biochemical defect within the brain, so that they do not feel like other people until their psychomotor level is artificially brought down by sedatives. This may or may not be so, but many people believe that such a biochemical defect will be shown to exist.

There is a clue in the frequent statement of alcoholics: "I had my first drink at 18, and I finally found out what it was like to feel normal. I had felt abnormal all my life until that first drink and then I felt like everybody else. If I could just maintain that level . . ." But of course an alcoholic can't. If his initial level of anxiety was already too uncomfortable, too agonizing to bear, how can he tolerate the increased anxiety from the agitating effect of the sedative? The only way he knows to relieve it is to take another drink. His decision to drink or not to drink has to be made before he takes the first one.

If you or I have a hangover after a party, it is unlikely that we are going to drink to relieve our temporarily elevated psychomotor activity level, unlikely that we are going to take a "hair of the dog", except perhaps one "Bloody Mary," and the majority of us won't even do that. Most of us will say: "I shouldn't have drunk so much and I won't do it again for a long time." We can tolerate this degree of psychomotor activity and after a few hours we begin to feel better. The alcoholic can't tolerate it and must drink again. **This is not volitional; he must drink again to relieve the discomfort which he couldn't tolerate even when it was less intense before.** It is relatively easy to understand continual drinking under these circumstances. But suppose we see this man after he has been sober six months or six years. He gets anxious, takes a drink, and in the majority of cases begins the cycle again. He can't plead ignorance and he did it while cold sober. Now when

you see this happening, there can be only two possible reasons. One is that alcoholism is a compulsive psychiatric syndrome of such a nature that his psyche is going to force him at knifepoint to drink throughout his life. The other possibility is that on a biochemical basis the alcoholic is truly uncomfortable without sedation. How much is psychological and how much is biochemical? Is the individual starting out with a normal anxiety level, or at a level higher than normal? If the psychomotor activity state can be markedly modified by drugs, as it can, how do we know it was "right" in the first place? We don't. It is quite possible that the individual has a biochemical defect to start with, which creates a fertile soil for the growth of alcoholism.

The treatment of this disease is to stop the use of the causative agent. When first seen by the physician, the alcoholic is a very agitated fellow and needs sedation, but if we sedate him, whatever we use will cause greater agitation later. The physician is in a circumstance where he's damned if he does and damned if he doesn't. Hence, Rule #1: **If you're going to have to relieve the symptoms of this alcoholic by giving him a sedative drug, you must rarely, if ever, give it outside the hospital.** Give it only in a situation where you have *complete* control of the patient and the dosage of medication. In a hospital, the physician can give some sedatives in association with phenothiazines, drugs such as chlorpromazine (Thorazine) or promazine (Sparine). These drugs will not usually prove addicting, but will increase the effects of the sedatives the physician is giving, and will enable him to relieve the patient without causing a marked increase in agitation. By the fourth or fifth day, the alcoholic will perhaps still be a little tremulous, but will usually feel well enough to go back to his job. But though the withdrawal state is at its worst for only a few days, its more subtle effects—psychological abnormality or character disorganization—may last for weeks.

Now the patient has been withdrawn from alcohol and is ready for long-term therapy for the recidivism or compulsivity that makes him start the whole cycle again, over and over again. You've got to help him build some sturdy walls before the wolf comes to blow again at his house. And you begin to appreciate the vigor and persistence necessary in therapy.

Obviously, the way to handle this individual in order to keep him from drinking again is *not* through the use of sedative drugs, because as soon as you give sedation of any sort, he begins to repeat the cycle. In fact, **the simple act of prescribing sedatives in order to relieve the anxiety symptoms of the alcoholic is the one thing that will guarantee failure almost 100% of the time.** There are, for the most part, no drugs of any great value in treating alcoholism. Chlordiazepoxide HCl (*Librium*), benzodiazepine derivative (*Valium*), meprobamate (*Miltown* and *Equanil*), and glutethimide (*Doriden*) are often used but share an undesirable propensity for being variably addicting. Remember, we noted at the outset that all of the sedative drugs are qualitatively identical and can replace one another: alcohol, barbiturates, chloral hydrate, paraldehyde. The individual develops a cross-tolerance, so that if, for example, he builds up a huge tolerance for alcohol, it will take a huge amount of ether to knock him out on the operating table, a fact which all anesthesiologists know. If you use other sedatives to treat the alcoholic, you go back and forth between the two and never solve anything—the individual remains addicted. Patients who take such drugs often get so jittery that they go back to alcohol for sedation.

The case of the phenothiazines is somewhat different. These drugs (Thorazine, etc.) work on a different part of the brain, and alcoholics usually don't like them, don't get the relief they want. Thorazine does not significantly increase the psychomotor activity level and hence is practically nonaddicting, but I believe that the person who takes it will more readily make a transfer back to alcohol than those who use no drugs. Since Thorazine doesn't give the alcoholic what he wants, he is almost bound to take something else in short order. I'm also convinced that if you give any sort of "oral magic" to an alcoholic, you are almost guaranteeing a relapse. If you give a pill (even if you fill it with sugar), you are in essence saying: "Yes, there is something wrong that is correctable by some magic taken by mouth." But the fact of the matter is, there are no sedatives or tranquilizers that do anything for this disease except cause trouble, and one should do everything possible to help patients realize that there is no magic.

Antabuse, on the other hand, has something to offer in the treatment of this disease. Antabuse is not a drug which works on the central nervous system: it does not relieve anxiety or change the psychomotor activity level of the brain. It has no effect whatever, unless the individual takes alcohol on top of it, in which case alcohol metabolism stops at the acetaldehyde stage. The acetaldehyde level builds up in the bloodstream, and it produces a toxic reaction which includes nausea, vomiting, flushing, vasomotor collapse and, in extreme cases, death. Most patients, even without trying it, will believe this. Antabuse is taken every day and gives four to five days protection against drinking.

Suggesting that a patient take Antabuse permits me to quickly gauge his degree of motivation. If he takes a negative attitude, I know the odds of

doing anything with this patient are poor. But if the patient is willing to take it, I know I have a more promising situation. Second, Antabuse stops impulsive drinking completely, because if the person on Antabuse drinks, he will be quite ill. If he comes in with a relapse, I have the opportunity to prove to him that he decided in advance to get drunk and so stopped taking the Antabuse several days ahead. I always have told him in advance that if he stops his Antabuse, it will be for one of these reasons: "I ran out and forgot to buy more"; "I forgot to take it"; "I went on a trip and forgot to pack it"; "I wanted to do it on my own and not use a crutch"; "I was so well, I thought I had no further need for it." Now, if he relapses, I have predicted these "reasons" in advance and so can help the patient see that he planned the drunk, and then we can get down to the real precipitating causes, not the phony ones.

The third thing Antabuse does is to assist patients in answering, once a day, the question of whether or not to drink. They are not preoccupied about drinking all day long, and they feel a tremendous relief, at least for a temporary period. Certainly, by itself, Antabuse is not the answer, but it is a helpful tool, and it gives the physician time to work with his patient. Some people take it for years to guarantee their sobriety, but it should be taken voluntarily and only because the individual wants to stop drinking.

In treatment, cessation of alcohol intake is the first goal. Education about the nature of the disease is essential, but most important is to bridge the alcoholic's isolation by the use of simple understanding and compassion. Usually the alcoholic has been trying to say right along (and no one in his environment has understood): "I'm strung up, I'm caught, and nobody seems to realize how violently ill, how terribly trapped I am. All people say is I just won't quit drinking or I bring it on myself." When the alcoholic becomes aware that you do understand, you may have a successful patient. With compassion and consistency, a great deal can be accomplished.

The long-term treatment of alcoholism must be directed toward increasing the abstinent alcoholic's capacity to tolerate anxiety without recourse to sedation. Obviously, he has to be given something to replace the "oral magic," and the only thing I know is a helping hand. The helping hand may be Alcoholics Anonymous or psychotherapy; it may be the clergyman, the social worker, or the physician. The alcoholic needs people who understand and are compassionate, who offer the ear, the time, and the hand to help him through his discomfort.

Maryland State department of mental hygiene

The Long-Term Patient

Nearly half of all beds in Maryland's mental hospitals are occupied by patients who have been under continuous care in the same facility for five or more years. As shown in the following table, 62% of these 3,581 individuals were reported to be psychotic. Of the other 1,359, 29.4% were retarded, 13.8% had convulsive disorders, and 16.2% were admitted for conditions related to old age. Their average (median) age at the time of admission was 35.6 years and is now 56.6 years.

CURRENT AGE AND DIAGNOSIS	AGE AT ADMISSION TOTAL	LESS THAN 25	25-44	45-64	65 AND OVER
TOTAL	3,581	853	1,761	741	226
PSYCHOTIC	2,222	514	1,264	405	39
LESS THAN 45	373	209	164	—	—
45-64	1,078	247	686	145	—
65 AND OVER	771	58	414	260	39
NONPSYCHOTIC	1,359	339	497	336	187
LESS THAN 45	263	197	66	—	—
45-64	565	126	307	132	—
65 AND OVER	531	16	124	204	187

The reported median length of hospitalization of these patients is 21.0 years. Based on available expenditure figures for this period, this is equivalent to an average cost per person in excess of $35,000. That is, $125 million has already been spent for their care and maintenance. Currently, 7% of long-term patients are released each year with the discharge rate decreasing with increasing age and length of hospitalization. If this pattern remains unchanged, most of these individuals can be expected to remain hospitalized 15 to 20 more years until their ultimate death. On the basis of current cost trends, this represents an additional expenditure per patient exceeding $35,000.

In recent years, approximately 250 long-term patients were discharged annually, 200 died, and 300 became chronic in the hospital. As a result, the number of these patients has declined 150 per year to the lowest level in a decade, with a further decrease anticipated. In 1960, for example, there were 5,016 such patients. Efforts to accelerate this trend are dependent on the development and expansion of closely coordinated and centrally directed programs to:

1. Counter symptoms and conditions leading to long-term hospital stay. Many patients admitted for acute disturbances eventually become chronic and custodial unless continuing efforts are made to channel these individuals into a functioning, community setting.

2. Release and habilitate inpatients who have been hospitalized for extended periods. Many of these could be discharged if adequate supportive community programs such as nursing homes, day and night centers, and sheltered workshops were available in conjunction with continuing psychiatric services.

State School Health Council Elects Officers

John M. Krager, MD, Assistant Health Officer in the Baltimore County Health Department, has been elected to a three-year term as Chairman of the Maryland State School Health Council, an advisory group to the State Department of Education and State Department of Health. Dr. Krager, a pediatrician, has represented the Maryland Conference of Health Officers on the Council for two years.

Other officers elected to the Council are Mr. Oscar Jensen, an Associate in Higher Education with the Maryland State Teachers Association, Vice Chairman; and Miss Joan M. Wolle, Chief, Division of Health Education, State Department of Health and Mental Hygiene, Secretary.

Other members of the Executive Board and the organizations they represent are as follows:

Gladyce Bradley, PhD, Morgan State College (representing Maryland State Teachers Association Higher Education Council)

Mr. James G. Busick, Superintendent of Schools, Dorchester County Board of Education (representing school superintendents)

Robert J. Dawson, MD, a pediatrician from Cumberland (representing General Body)

Mr. Francis J. Dickson, Administrative Assistant, Department of Education, Archdiocese of Baltimore (representing Dept. of Education, Archdiocese of Baltimore)

Mrs. Robert Gaskins, MCPT Health Chairman (representing Maryland Congress of Parents and Teachers)

Mr. Richard Hartt, Specialist, Division of Child Welfare Services, State Department of Social Services (representing State Department of Social Services)

Fred J. Heldrich, MD, Director of Continuing Medical Education, State Department of Health (representing Maryland Chapter of American Academy of Pediatrics)

Frederick R. Keyton, PhD, Coordinator of Pupil Services, State Department of Education (representing State Board of Education)

Miss Pauline V. Kummer, RN, Public Health Nursing Consultant in Pediatrics, Division of Nursing, State Department of Health (representing State Department of Health)

John B. Saratsiotis, MD, Director of School Hygiene, Baltimore City Health Department (representing General Body)

Robert E. Schneider, PhD, Supervisor of Health Education and Service, Montgomery County Public Schools (representing General Body)

Mr. Frederick Sheeley, Supervisor of Special Education, State Department of Education (representing State Department of Education)

Margaret L. Sherrard, MD, Deputy Director, Baltimore County Health Department (representing the Medical and Chirurgical Faculty of Maryland)

Miss Doris E. Terry, Supervisor of Health Education, State Department of Education (ex officio)

Alice B. Tobler, MD, Director of Mental Health Planning, State Department of Mental Hygiene (representing State Department of Mental Hygiene)

Mrs. Beatrice L. Wolcott, RN, Supervisor of Nurses, Secondary Schools (representing Maryland State Nurses Association)

Formed approximately 20 years ago, the Council assists in the development of school health programs

which afford maximum health benefits to every school-age child in Maryland.

Dr. Krager stated that the Council promotes effective and comprehensive school health programs designed to provide a safe, healthful school environment; instruction in sound health and safety practices; and appropriate school health services.

The new Chairman cited some of the Council's past contributions to school health in Maryland: achievement of better communication and coordination between the State Departments of Education and Health; recommendations for revisions in the State School Health Laws; advice to the State Health Department on certain legislative proposals; development of a health appraisal form for use in schools in Maryland; and sponsorship of a statewide health education conference in 1962.

Currently, the Council is working on preparation of a school health manual for use in schools throughout the state, suggested revisions of the bylaws of the Board of Education relating to required immunizations, and plans for another health education conference to follow-up the 1962 meeting.

Chairmen and the standing committees to which they have been appointed include:

Health Services—Julius Loebl, MD, Director, Division of Maternal and Child Health, Anne Arundel County Health Department

Health Education—Herbert L. Jones, HSD, Head of Health Education, Department of Physical Education, Recreation and Health, University of Maryland

Healthful Environment—Mr. James G. Busick, Superintendent of Schools, Dorchester County Board of Education

In addition to the Executive Board, the Council includes two representatives from Baltimore city and each of the 23 counties, one of whom is appointed by the Health Officer and the other by the Superintendent of Education.

rehabilitation notes

Illustrations of Patients With Spinal Cord Injuries

The purpose of this communication is to illustrate different problems in the management of patients with spinal cord injuries.

Unexpected Good Adjustment to Disability in a Patient with Sociopathic Personality

B.C.H. # 24 68 65, a 19-year-old boy, was shot through the spine on June 16, 1958, resulting in a complete paraplegia at T6. There was a hemopneumothorax. An emergency laminectomy revealed a frayed, blue-black cord. A catheter was placed in the bladder, and the patient was transferred to the Baltimore City Hospitals on July 15, 1958. The hemopneumothorax had disappeared. The patient had a complete physiological cord transection at T6. Over the next several months, the patient was mobilized with long leg braces. He developed a spastic bladder and was able to use condom-type drainage with a urinal bag. There was no evidence of urinary tract infection or distortion, and no reflux into the ureters on X-ray.

A remarkable change took place in this patient during treatment. Prior to the injury, he had been an irresponsible child involved with a gang of street rovers. The patient came from a lower-middle-class family and had been the "black sheep" of his family, relating poorly to his siblings. Prior to his injury, he led a semiviolent, nomadic existence and had difficulty with legal authorities. One psychologist characterized him as the "soldier of fortune" type. His parents died on the same day when he was 19 years old, his father of a heart attack and his mother of a carcinoma of the stomach. He had a ninth grade education.

After several weeks in the hospital, the patient began working very hard, was conscientious, overcame tremendous difficulties, and finally accomplished ambulation with crutches with long leg braces, despite his high lesion.

Late in 1959, the patient was accepted at the Bulova Watch Repair School on Long Island, where he completed the training course. While there, he was a member of the Wheelchair Basketball Team and participated in the Paraplegic Olympics in England. Following graduation he opened a watch repair shop. Subsequently he married, and remains self-supporting 11 years following discharge.

Comment: This patient's life style was completely changed by his spinal cord injury. Following the injury he underwent a complete personality change, fighting his disability with stubborn courage, going on to achieve complete financial independence, as well as a stable marriage, with none of the usual complications of spinal cord injury.

Partial Paraplegia in a Patient with a Sociopathic Personality With Recovery

B.C.H. # 26 21 66, a 19-year-old man, was admitted on May 4, 1959 with a crushed fracture and cord injury at L_2 to L_3. The patient was completely paralyzed in the legs when first seen in the hospital. He was unable to void. A catheter was introduced and a laminectomy performed. The cord was intact, but bruised. Thereafter, the patient was very uncooperative and hostile. The psychologist felt that he had a low frustration tolerance, poor control of his impulses, little motivation to work, and a self-defeating attitude with impulsive hostilities. It was felt that he would not benefit from any type of vocational training program and doubtful that he could maintain himself in a responsible work situation. The patient stated that if he did not get well he would kill himself. He felt that the medical procedures had injured him so that he would not recover. In April 1960, the patient lapsed into periods of unresponsiveness on a number of occasions, and no apparent cause could be found. Long leg caliber braces were obtained, and it was finally possible to get the patient

up on his feet with the help of crutches.

He was discharged in May 1960, one year after his injury, with braces, crutches, and a wheelchair.

He returned on April 13, 1961 asking for help in finding a job. Because of the psychological report, it was felt that no more could be done for him. He was registered at the State Employment Office.

In the spring of 1968, he returned, and was still using his braces and crutches. He reported that he had been holding a job at the Social Security Administration for the last two years. He had been married happily for a number of years.

Comment: It took this patient a number of years to accept his disability and try to make the most of it. Acceptance of a disability is a peculiarly personal process, and the efforts of medical personnel to help him may be spectacularly unsuccessful.

Housewife With Ten-Year Survival, Skin and Renal Complications

B.C.H. # 21 97 66, a 41-year-old married woman, was brought to the hospital on October 13, 1956 after being shot through T7 by her husband. The husband had thought she was dead and had shot and killed himself. A left pneumothorax was treated with tube suction. Laminectomy showed complete severance of the cord at T7. The patient was treated with tidal drainage and was rapidly mobilized. Over the next few months, she was able to transfer from bed to wheelchair and back; long leg braces were obtained, and the patient learned to use them well. She developed some small ulcers which healed rapidly. She was discharged and sent home, where her daughter was able to do the shopping, laundry, and cooking. Otherwise, the patient was independent.

At the end of two years, the patient was socially independent at home but was having occasional urinary tract infections. She had a small sacral ulcer which never healed completely. She had two hospital admissions for treatment of pyelonephritis in 1958. Late in 1958, she had a three-week hospital stay for closure of the ulcer. Because of an atonic bladder, a transurethral resection was attempted on September 9, 1959 to allow the patient to empty her bladder with abdominal pressure. This was unsuccessful, and on November 4, 1959 an uretero-ileo-cutaneous fistula was created. Intravenous pyelograms prior to surgery had been normal but, following operation, enlarged bilateral ureteral dilation with hydronephrosis developed. This cleared when the stoma was enlarged. The right ureter became obstructed at the anastomotic site to the ileum. Eventually the right kidney became nonfunctioning. On April 29, 1964 a revision of the right uretero-ileostomy anastomosis was performed. Following surgery there was a fecal fistula (January 8, 1965). Intravenous pyelograms thereafter showed that the right kidney remained inactive. The patient gradually lapsed into uremia and died on January 4, 1966 of uremia.

Comment: This patient made a satisfactory functional recovery, but had persistent urinary tract infections and pyelonephritis, not improved by uretero-ileo-cutaneous fistula. Attempts at revision of the uretero-ileostomy anastomosis were unsuccessful. Although the uretero-ileo-cutaneous fistula cannot be clearly identified as the cause of death, it was unsuccessful in delaying deterioration of renal function.

Septicemia, Contractures, Pyelonephritis, and Death in a Quadriplegic

B.C.H. # 35 71 65, a 49-year-old man, had a severe fall on September 24, 1962 resulting in subluxation C5 on C6 with quadriplegia. He was placed in traction at another hospital and transferred to Baltimore City Hospitals on November 21, 1962. There was no useful function in the legs or arms. The patient was seen daily on the ward in an attempt to maintain range of motion in the arms. Despite this, he developed a flexion contracture of the right elbow which was worked on daily with heat and stretching. On December 15, 1962, he developed phlebitis in the left arm secondary to repeated intravenous infusions followed by septicemia. There were intermittent febrile episodes, cystitis, and pyelonephritis. Within three months of injury the patient was thin and wasted, and had severe recurrent renal infections, decubitis ulcers, and contractures. He was unable to maintain nutrition. On February 24, 1963 the patient died, probably of septicemia.

Comment: One small complication (phlebitis) may lead to other more serious episodes (septicemia, contractures, pyelonephritis) tipping the very precarious balance of the quadriplegic, and resulting in early death.

Recovery in an Aged Patient With Multiple Diseases

B.C.H. # 32 31 10, an 85-year-old woman, fell on January 29, 1962 and suffered a dislocation of C1, secondary to a flexion-type injury. Crutchfield tongs were inserted and the dislocation was corrected. The patient had marked weakness of both upper and lower extremities on admission. She was incontinent of urine and feces. She was confused and had difficulty with language.

There was a past history of arteriosclerotic heart disease in compensation with digitalis and diuretics and an old left-hip fracture. Two months after admission, the patient was started on mobilization at which time she had an ADL score of 23 and a MSCL score of 12. The question of whether ambulation should be considered was raised since the patient had already had one fall. However, she was started in parallel bar work and over the next three

months was able to master walking with supervision. She was kept in a neck brace, taken to a walkerette, and was discharged with her neck brace, and was independent in a walker three months after her discharge.

Comment: Despite age and other disabilities, recovery of function may occur if complications can be prevented.

Quadriplegia in a Patient with Ankylosing Spondylitis

B.C.H. # 44 96 86, a 48-year-old man, was admitted on April 4, 1966 complaining of an inability to walk for 24 hours.

The patient had a long history of rheumatoid spondylitis which was treated in the past with steroids. The rheumatoid spondylitis had been slowly progressive, involving the spine from the pelvis to the skull.

Two days before admission, the patient had been involved in an automobile accident. He came to the emergency room on April 2 where a laceration of the upper lip was sutured. He remained overnight in the emergency ward and had some soreness of his neck and arm, but claimed that he had previously had these symptoms associated with his rheumatoid spondylitis. He was discharged, walked to his car, and drove home. Three hours after his arrival at home his legs gave way, and he was unable to walk. Thereafter he noted progressive paresthesias and returned to the emergency room the following day.

The patient had been able to work as a crate maker until the time of his automobile accident.

Examination showed a temperature of 102°F, P 132, R 24 and BP 130/70. The neck was flexed to 90° with pain on extension or flexion. There was very little motion present in the neck. The chest expanded poorly, and he used his abdominal muscles mainly for respiration. A few rales were noted over the left lower lung fields and tubular breathing was heard at the right base posteriorly. The bladder was grossly distended to the umbilicus. There were no bowel sounds. The patient had good biceps and triceps strength on the right, but had poor muscle strength in these muscles on the left. The left lower extremity could not be moved. The right lower extremity could be moved, but all muscles were weak. Below the umbilicus on the left, pin-prick and touch sensations were reduced. Position and vibratory sensation were intact. There was hyperflexia of the left knee and ankle. There was no clonus. The Babinski sign was positive on the left; there was no ataxia or tremor.

Chest X-rays showed a pneumonic infiltration of the left lower lobe. The lumbar puncture was normal. The blood leukocyte count was 16,250.

The patient was catheterized and a residual urine output was 900 cc. An emergency myelogram showed complete block of C5 to C6 level. He was started on intravenous penicillin and fluids.

On April 5 the patient underwent a cervical exploration, and it was found that the lamina of C5 spine was broken. There was an epidural hematoma at the C5 level. The laminectomy was extended from C4 to T1. The patient had to have a tracheostomy prior to surgery to allow proper administration of anesthesia.

The patient's weakness disappeared in the week following surgery. On April 11, over a period of several minutes, the patient noted that he could not move his right leg. He was unable to move his fingers on his right hand and his left arm became weak. Cervical X-rays showed there was a dislocation fracture of C7 on T1. Crutchfield tongs were applied, and the spinal column became realigned by April 14. He continued to improve. By April 18 the tracheal tube was removed. Further X-rays, however, showed that the alignment of the spine was not ideal. Crutchfield traction was continued and over the next month there was gradual improvement in strength. By June 16 the patient had the Crutchfield tongs removed and replaced by a neck brace. It was then possible to mobilize the patient, and he was able to be discharged ambulatory on June 17, 1966. At this time he had weakness and atrophy of the left triceps and the fingers of the left hand.

Comment: Mild neck trauma in patients with ankylosing spondylitis, as well as cervical osteoar thritis, is frequently associated with paraplegia.[1]

Quadriparesis With Cervical Osteoarthritis

B.C.H. # 37 35 25, a 53-year-old man, fell down the steps on May 10, 1963, hurt his neck, and was unable to walk. He was taken to an emergency room in an ambulance and was sent home after observation. He was admitted on May 18, 1963 with weakness in his arms and legs. He had severe cervical osteoarthritis. A myelogram showed impingement of osteoarthritic spurs on the cervical cord from C4 to C6. No fracture or dislocation was clearly identified. A laminectomy, C4 to C6, was performed with foraminectomies and stabilization of the cervical spine. The MSCL score initially was 25 and the ADL score 30. Over the next six months there was gradual return of function in the legs and bowel and bladder, and he reached an ADL score of 90 by November 1, 1963. He was able to do everything except button small buttons, wash his back, or tie his shoes. He was given elastic shoe laces. The patient was thought to have cervical spondylosis with a traumatic injury in the neck area resulting in pressure on the cord involving the lower extremities and pressure on the nerve roots of the upper extremities.

Comment: Patients with cervical osteoarthritis are particularly likely to suffer root and cord injury with moderate twisting of the neck and without fracture of vertebrae. We have seen a very similar patient, also sent out from an emergency room, who developed severe quadriparesis. One other patient developed quadriplegia following surgery, presumably secondary to hyperextension of the neck during anesthesia.

Partial Paraplegia With Improvement After X-ray and Surgery in Hodgkin's Disease

B.C.H. # 47 78 56, a 33-year-old man, was admitted on September 6, 1966 because of weakness in his legs. A diagnosis of Hodgkin's disease had been made in 1960. Since that time, he had had all available types of treatment for Hodgkin's disease. In December 1960, he had developed weakness of both upper extremities, presumably caused by cord pressure by a granuloma of Hodgkin's disease. X-radiation had completely relieved the weakness.

In March 1962, recurrence of weakness in the upper extremities and compression of the cord was demonstrated by myelograms. X-radiation again relieved the weakness of the upper extremities. In 1962, treatment with nitrogen mustard and X-ray resulted in complete disappearance of demonstrable Hodgkin's disease. He was able to return to work.

In July 1965, leg weakness, numbness, and bladder incontinence occurred and a diagnosis of lower cord compression was made. A laminectomy was performed from T5 to T8 with decompression of the dura mater. There was complete reversal of weakness, bladder symptoms, and numbness. In September 1966, there was rapid recurrence of the leg weakness, and he was readmitted. A second laminectomy from T6 to T7 with excision of a 6 x 2 cm tumor was performed on September 28, 1966. Following the operation, the strength of the legs again returned, and he was referred to the Physical Therapy Department on November 7, 1966. Over the next few weeks, he regained strength in the legs, but because of persistent mild weakness in the legs, he was discharged on crutches.

Comment: We have now seen several patients with paraplegia associated with Hodgkin's disease who have regained strength with X-radiation, drug therapy, and laminectomy.

Iatrogenic Paraplegia With Complications

B.C.H. # 42 66 06 was 16 years old in July 1959 when she delivered her first child under spinal anesthesia. Postpartem she had paresthesias in her left leg, and two weeks after delivery she developed severe thrombophlebitis in this leg which gradually became completely paralyzed. There was gradual increase in the weakness of her lower legs with development of complete paraplegia which appeared to be at T8. There was recurrent thrombophlebitis with pulmonary emboli. An inferior vena caval ligation was performed for clear-cut pulmonary emboli. At surgery, a clot was removed from the inferior vena cava. The procedure was done under continuous spinal anesthesia. Following this procedure the paraplegia became complete and stable.

In 1960, she came to Baltimore and was seen in a local hospital, where she weighed 80 lb and had severe decubitus ulcers. There was a complete paraplegia at T8. Spinal exploration in 1960 resulted in a diagnosis of adhesive arachnoiditis. She spent 15 months at a rehabilitation hospital where she was able to perform all activities of daily living from a wheelchair but, despite extensive surgery, her decubitus ulcers never completely healed. She had excision of the greater trochanter on the left, removal of the left ischial tuberosity and inferior ischial ramus for osteomyelitis. The inferior ischial and pubic rami on the right were removed. She suffered a fracture of the right trochanter thought to be secondary to mild trauma in a demineralized bone. On October 23, 1963, the patient felt her left hip snap, and X-rays showed a complete transverse fracture of the upper femur. A disarticulation of the left lower extremity with hemipelvectomy was recommended because of osteomyelitis, but the patient had a severe emotional reaction and refused surgery. In 1963, a ureteral-ilio-cutaneous fistula was performed which functioned fairly well thereafter.

In 1963, she developed severe migraine headaches and was treated with ergotamine. Shortly after this she began to have signs of vascular insufficiency in the legs and required an amputation of the left leg. Thereafter her emotional anxiety and depression increased greatly.

The patient was first admitted to Baltimore City Hospitals on January 22, 1965 because of premature labor. The baby was delivered dead. Because of a severe anemia, the patient was transferred to the medical service. She had an elaborate work-up resulting in a diagnosis of folic acid deficiency. There were decubitus ulcers over the sacral area and heels. The paraplegia below T8 was clear-cut and symmetrical.

At home she sat in a wheelchair, and was able to clean house and take care of her children. She continued to have open decubitus ulcers.

Her second admission to BCH on May 25, 1966 was for an acute pulmonary embolus.

On June 26, 1967 she was admitted for acute thrombophlebitis of the left thigh.

On September 9, 1967 she was admitted for a suicide attempt with coumarin.

Her fifth admission to BCH was on October 5-10, 1967 for recurrent pulmonary emboli. The patient was discharged to her local physician.

Comment: This patient developed most of the

complications of paraplegia and several which may not be associated with it. She had severe thrombophlebitis, recurrent osteomyelitis, decubitus ulcers (which could not be completely controlled), and depressive reaction with a suicide attempt. In addition, she had what appeared to be a folic acid deficiency and peripheral vascular insufficiency of uncertain cause, resulting in a necessary amputation.

Summary: Patients with spinal cord injuries challenge nearly every aspect of medical care. In the acute stage they may require the intervention and exquisite coordination of a number of specialists working together as a team. Nursing care is always stretched to the limit in the prevention of decubitus ulcers.

During the stage of recovery, psychiatric problems may arise: Depression may set in at a time when the cooperation of the patient in self-care is essential.

Even if the acute and recovery hurdles have been passed successfully, the long-term problems of these patients increase and frequently result in multiple hospital admissions. Nowhere is the physician's long-term interest required more; nowhere is the patient's motivation and cooperation more important; in few situations are preventive measures more essential.

Withdrawal or No Withdrawal, 400 MD Volunteers Needed in Viet Nam

Despite the impressive success of the Volunteer Physicians for Viet Nam program, 400 more MDs are needed to meet the AMA commitment to the U. S. Agency for International Development for administering the program until June 1971.

Medical societies have been requested to encourage members to volunteer for a tour of duty, and the program is making available a "recruitment" film, "Bac Si My" (Vietnamese for American physician). The 13-minute color-sound film depicts the activities of physicians serving a 60-day tour, and it is designed for use by former volunteers, by medical societies, service clubs and lay groups, and for television. Prints are available on loan from: Program Director, Volunteer Physicians for Viet Nam, AMA, 535 North Dearborn Street, Chicago, Ill. 60610.

Travelers Insurance Companies Highway Statistics for 1968

Crossing between intersections was responsible for 40% of the pedestrian deaths in 1968, according to annual figures compiled by The Travelers Insurance Companies. More than 9,600 pedestrians were blamed for their own deaths last year.

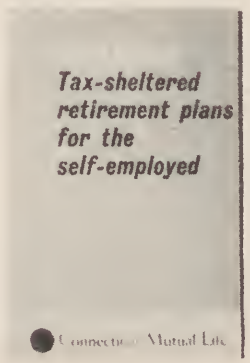
Drivers under 25 years of age account for only one fifth of America's drivers, but were involved in one-third of all fatal highway crashes in 1968, according to an annual report from The Travelers In surance Companies.

Almost 70,000 motor vehicles were involved in fatal highway crashes in 1968. Of these, more than 55,200 were private passenger cars, according to The Travelers Insurance Companies annual statistics.

Should You Incorporate?

Maybe Yes.

The present I.R.S. position boils own to this: When you become an em- oyee of your own professional corpo- tion or association, a lot of good things n happen. For one thing, you may cut our income tax. For another, you can beef up your retirement investments with more tax-sheltered dollars.



After reading our booklet, "Professional Corporation Tax Benefits," you may well decide to explore the atter further with your attorney or tax ccountant.

Maybe No.

There could be several reasons why the idea of incorporation doesn't fit your current picture. If so, all the more reason for you not to miss out on Keogh Plan advantages.

This plan gives you several tax benefits. Like tax-deductible contributions.

And tax-sheltered accumulations of your retirement nest-egg. The full story is waiting for you in our booklet, "Good News."

Send now for a copy of either informative booklet. Explore these opportunities for saving money. But remember, you won't get the tax benefits unless you do *something*. The coupon below is your first step.

from the discord of anxiety...

to emotional harmony

Before prescribing, please consult complete product information, a summary of which follows:

INDICATIONS: Indicated when anxiety, tension and apprehension are significant components of the clinical profile.
CONTRAINDICATIONS: Patients with known hypersensitivity ta the drug.
WARNINGS: Cautian patients about possible combined effects with alcahol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Though physical and psychalagical dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals ar those wha might increase dasage; withdrawal symptoms (including convulsions), fallawing discantinuation af the drug and similar to thase seen with barbiturates, have been reported. Use af any drug in pregnancy, lactation, or in women af childbearing age requires that its potential benefits be weighed against its possible hazards.
PRECAUTIONS: In the elderly and debilitated, and in children aver six, limit to smallest effective dasage (initially 10 mg or less per day) to preclude ataxia or oversedatian, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally nat recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use af patentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence af impaired renal ar hepatic function. Paradaxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulatian have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relatianship has not been established clinically.
ADVERSE REACTIONS: Drawsiness, ataxia and confusian may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally abserved at the lower dasage ranges. In a few instances syncope has been reparted. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido--all infrequent and generally contralled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulacytasis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

with the aid of antianxiety

Librium®
(chlordiazepoxide HCl)
5-mg, 10-mg and 25-mg capsules

In an age of swift change and challenge, susceptible individuals may experience varying degrees of excessive anxiety. The resulting emotional stress may precipitate significant functional disorders or complicate existing arganic disease. In properly individualized maintenance dosage, Librium (chlordiazepoxide HCl) quickly helps relieve anxiety and apprehension, provides useful adjunctive therapy in psychophysialogic disorders. In long clinical experience, Librium has demonstrated a wide margin of safety.

Our completely new 100-bed facility is NOW OPEN

We are Baltimore's most centrally located nursing home. Minutes from Towson, Roland Park, Homeland, and all of northern Baltimore's hospitals.

The right attitude

. . . has earned us an enviable reputation in Baltimore's wide spectrum of health care establishments. We feel that our approach to the problems of elderly, chronically ill, and convalescent patients makes us different. Our people give of themselves beyond the call of duty to our guests with more than the amount of service expected.

If the RIGHT ATTITUDE is what you're looking for . . . . . with day and night vigil by professional nurses . . . individually programmed meals under the control of a staff dietician . . . physical, occupational and recreational therapy . . . a pleasant, home-away-from-home atmosphere . . . . . Edgewood Nursing Home should be your first preference.

EDGEWOOD
NURSING & CONVALESCENT HOME
6000 Bellona Avenue, 323-4223

LACTINEX®

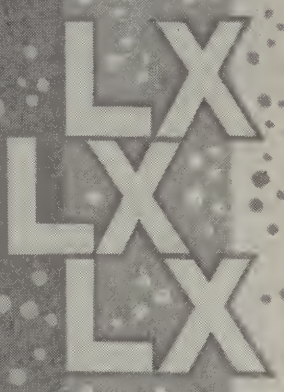
TABLETS & GRANULES

■ **to help restore and stabilize the intestinal flora**

■ **for fever blisters and canker sores of herpetic origin**

Lactinex contains both *Lactobacillus acidophilus* and *L. bulgaricus* in a standardized viable culture, with the naturally occurring metabolic products produced by these organisms.

Lactinex has been shown to be useful in the treatment of gastrointestinal disturbances, and for relieving the painful oral lesions of fever blisters and canker sores of herpetic origin.[1,2,3,4,5,6,7,8]



No untoward side effects have been reported to date.

Literature on indications and dosage available on request.

A urinary tract infection was eliminated last week

Intestinal monilial overgrowth has appeared this week

For women who are diabetic or debilitated, oral antibiotic therapy often sets the stage for monilial overgrowth in the intestine.

When you anticipate such a problem, take action with DECLOSTATIN 300. It combines the broad-spectrum potency of demethylchlortetracycline with the antifungal effectiveness of nystatin—it helps avoid monilial take-over. Experience has shown DECLOSTATIN to be highly useful for many women patients; individual culture studies will show exactly where this usefulness may best be applied.

It doesn't let monilia begin where bacteria end. Declostatin® 300

Demethylchlortetracycline HCl 300 mg and
Nystatin 500,000 units Capsule-Shaped Tablets Lederle

Effectiveness: Because its antibacterial component is DECLOMYCIN® Demethylchlortetracycline, DECLOSTATIN should be equally or more effective therapeutically than other tetracyclines in infections caused by tetracycline-sensitive organisms. The antifungal component, nystatin, protects against superinfection by antibiotic-resistant fungal overgrowth (particularly monilia) in the intestinal tract.

Contraindication: History of hypersensitivity to demethylchlortetracycline or nystatin.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose-related. Transient, reversible, nephrogenic diabetes insipidus with excessive thirst and polyuria (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: One tablet b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

Editorial—Reach to Recovery—A Program of the American Cancer Society, Edward A. Sawada, MD; Albert C. W. Montague, MD; Mrs. Sonia K. Lowitz 5

A Survey of Heritable Disorders in Maryland, Patrick F. Maloney, MD, MPH; Margaret H. Abbott, RN, MPH; Helen Abbey, ScD; Benjamin D. White, MD, MPH 43

"A rapid increase in research discoveries and an awareness of the value of genetic counseling have heightened interest in medical genetics. As a result of this trend, at least 15 state health departments have started programs in genetics. The present study was undertaken in collaboration with the Maryland State Department of Health as a preliminary step in expanding health services in genetics."

The Number of Children and the Supply of Physicians in Maryland Since 1940, Oscar C. Stine, MD, DrPH 51

"In January 1968 we found that present educational facilities and present patterns of recruitment or of practice would not satisfy the increasing demand for physicians to provide medical care for children in private offices.

"The Committee on Medical Care of the Maryland State Planning Commission had at that time received reports of shortages of physicians which are understood to be problems in distribution. To study patterns of distribution we reviewed population changes for each county in Maryland and compared them with the number of pediatricians and general practitioners in the same counties."

REACH TO RECOVERY

EDWARD A. SAWADA, MD
Chairman, Service Committee
American Cancer Society
Maryland Division, Inc.

ALBERT C. W. MONTAGUE, MD
Maryland State Medical Advisor
Reach to Recovery Program

MRS. SONIA K. LOWITZ
Maryland State Co-ordinator
Reach to Recovery Program

A Program of the American Cancer Society

The number of patients with mastectomies has increased faster than the available supply of surgeons, placing an added burden on physicians, nurses, and other hospital personnel. It is difficult for them to cope with all the time-consuming habilitative activities which are essential to the recovery of the mastectomy patient.

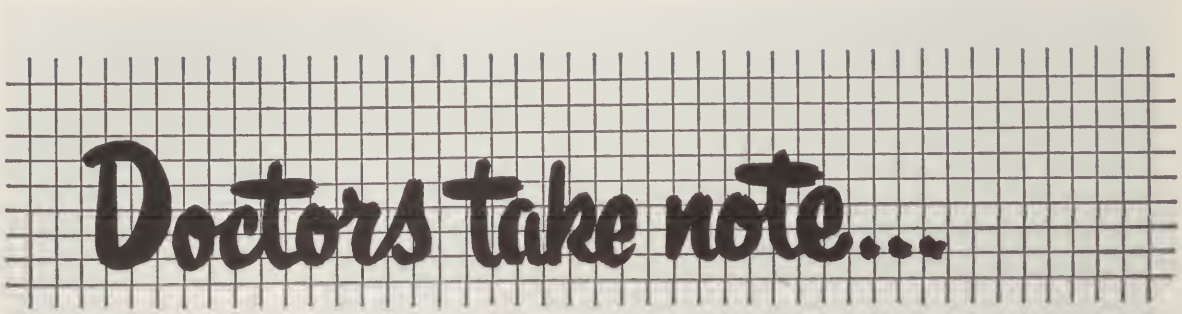
The *Reach to Recovery Program* of the American Cancer Society, Maryland Division, is designed to help the medical personnel meet this enormous need.

Reach to Recovery's main function is a woman-to-woman program, whose sole purpose is to provide physical, emotional, and cosmetic information and support to the hospitalized mastectomy patient. The patient is able to see and talk to another woman who has had similar surgery.

This free service is a segment of the Patient Service Program of the American Cancer Society. It is *not a club.*

Carefully screened and trained *Reach to Recovery* volunteers visit patients in the hospital three to six days following surgery for the purpose of giving general reassurance for more immediate comfort. The volunteers are taught strict medical ethics. They do not discuss the medical aspects of the operation. All medical questions are referred to the patient's surgeon. Volunteers may visit a patient only with the surgeon's permission and exercises are demonstrated only with the surgeon's permission.

When the volunteer visits, she gives the patient a kit which contains a manual, a ball and a length of rope for exercises, a temporary prosthesis made of washable dacron fluff, a letter to husbands and teenagers, as indicated, and a list of commercial establishments selling permanent prostheses.



The goal of *Reach to Recovery* is to provide:

1. **Assistance for emotional stability at a time of crisis.**
2. **A mechanism for the patient to relate to another woman who has had the same surgery—living visual proof that it is possible for her to look normal and to resume her normal activities.**
3. **Free, specialized, practical help to the mastectomy patient without interfering with the physician-patient relationship.**

Another important aspect of *Reach to Recovery* is an educational plan for health professionals and personnel responsible for the comfort of the mastectomy patient. This is conducted in the form of lectures and demonstrations to nurses, students, and other hospital personnel.

Reach to Recovery has been enthusiastically accepted in many of the Baltimore metropolitan area hospitals and other hospitals throughout the state.

Further information about *Reach to Recovery* may be obtained by calling the local unit of the American Cancer Society.

Baltimore County Medical Association
April Meeting Notes

The regular monthly meeting of the association was held at the Sheppard Pratt Hospital on Wednesday, April 15, 1970. The Vice-President, John Krager, MD, presided. The new members were first introduced and given a warm welcome. The minutes of the previous meeting were approved as read. Herbert Levickas, MD, the Secretary-Treasurer, reported approximately $24,500.00 in the treasury. Dr. Levickas read a letter from Martin Middleton, MD, Chairman of the Legislative Committee of the Faculty, thanking the members for their aid in Annapolis.

Dr. Krager announced that there are 403 members in the Baltimore County Medical Association. The next meeting will be held at the Eudowood Plaza on May 22, 1970, starting at 6:30 PM with cocktails, followed by dinner at 7:30 PM. This will be a joint meeting with the Woman's Auxiliary. The June meeting will be at St. Agnes Hospital with Neil Solomon, MD, PhD, as the speaker.

A report of the House of Delegates meeting was read by Edward Krieg, MD, one of the delegates.

A motion was passed to donate $100 to the new Franklin Square Hospital.

Three new members were unanimously approved.

Dr. Krager introduced Robert Gibson, MD, Medical Director of the Sheppard Pratt Hospital, who gave an introductory talk concerning an emergency psychiatric service to be started at the Hospital on June 1. He then introduced Samuel Blumenfeld, MD, who will head this new program. Dr. Blumenfeld reported that a grant has been received from the State Department of Health for this emergency service. The patients will be seen by a medical resident at the Greater Baltimore Medical Center who would then contact a psychiatric resident at the Sheppard Pratt Hospital. One of the purposes of this "crisis intervention clinic" is to see patients as soon as possible and perhaps avoid an admission to a state mental hospital.

Dr. Krager thanked Dr. Gibson and Dr. Blumenfeld. There being no further business, the meeting was adjourned.

B. B. Velez, MD, FACS, Chairman, Public Relations

"Mommy,
I don't feel
so good..."

Young heads and stomachs often can't manage the pace of hurry-up-and-stop for the light... or going up hill, down hill, and around the curve. All too quickly a pleasant drive can become an upsetting trip. *Motion sickness makes children—and their parents—absolutely miserable.*

You can help make young patients better passengers with

BONINE®

(MECLIZINE HCl)

Bonine protects most patients—young or old—against nausea and vomiting up to 24 hours with a single dose. Pleasant-tasting Bonine tablets are chewable. They can be taken anytime, anywhere, without water. In difficult cases, multiple daily doses may be necessary for maximum response.

Precautions: Although the incidence of drowsiness and atropine-like side effects such as dry mouth and blurring of vision is low, the physician should alert the patient to the need for due precautions when engaging in activities where alertness is mandatory. *Use in women of childbearing age:* In weighing potential benefits vs. risk in women of childbearing age, consider the fact that a review of available animal data reveals that meclizine exerts a teratogenic response in the rat. In one study a dose of 50 mg./kg./day (50 times the maximum recommended human dose) produced cleft palate in 2 of 87 fetuses when administered to the rat at critical times during the first 15 days of gestation. At doses of 125 mg./kg./day, meclizine will produce 100% incidence of cleft palate in the rat. At doses of 25 mg./kg./day, decreased calcification of the vertebrae and relative shortening of the limbs were also produced in the rat, but experts disagree as to whether this is a teratogenic response. While available clinical data are inconclusive, scientific experts are of the opinion that this drug may possess a potential for adverse effects on the human fetus. Consequently, consideration should be given to initial use of a nonphenothiazine agent that is not suspected of having a teratogenic potential. In any case, the dosage and duration of treatment should be kept to a minimum.

Supply: 25 mg. scored tablets.

Synthroid®

(sodium levothyroxine)

Indications: SYNTHROID (sodium levothyroxine) is specific replacement therapy for diminished or absent thyroid function resulting from primary or secondary atrophy of the gland, congenital defect, surgery, excessive radiation, or antithyroid drugs. Indications for SYNTHROID (sodium levothyroxine) **Tablets** include myxedema, hypothyroidism without myxedema, hypothyroidism in pregnancy, pediatric and geriatric hypothyroidism, hypopituitary hypothyroidism, simple (non-toxic) goiter, and reproductive disorders associated with hypothyroidism. SYNTHROID (sodium levothyroxine) **Injection** is indicated in myxedematous coma and other thyroid dysfunctions where rapid replacement of the hormone is required. When a patient does not respond to oral therapy, SYNTHROID (sodium levothyroxine) injection may be administered intravenously to avoid any question of poor absorption by either the oral or the intramuscular route.

Precautions: As with other thyroid preparations, an overdosage may cause diarrhea or cramps, nervousness, tremors, tachycardia, vomiting and continued weight loss. These effects may begin after four or five days or may not become apparent for one to three weeks. Patients receiving the drug should be observed closely for signs of thyrotoxicosis. If indications of overdosage appear, discontinue medication for 2-6 days, then resume at a lower dosage level. In patients with diabetes mellitus, careful observations should be made for changes in insulin or other antidiabetic drug dosage requirements. If hypothyroidism is accompanied by adrenal insufficiency, as Addison's Disease (chronic subcortical insufficiency), Simmonds's Disease (panhypopituitarism) or Cushing's syndrome (hyperadrenalism), these dysfunctions must be corrected prior to and during SYNTHROID (sodium levothyroxine) administration. The drug should be administered with caution to patients with cardiovascular disease; development of chest pains or other aggravations of cardiovascular disease requires a reduction in dosage.

Contraindications: Thyrotoxicosis, acute myocardial infarction.

Side effects: The effects of SYNTHROID (sodium levothyroxine) therapy are slow in being manifested. Side effects, when they do occur, are secondary to increased rates of body metabolism: sweating, heart palpitations with or without pain, leg cramps, and weight loss. Diarrhea, vomiting, and nervousness have also been observed. Myxedematous patients with heart disease have died from abrupt increases in dosage of thyroid drugs. Careful observation of the patient during the beginning of any thyroid therapy will alert the physician to any untoward effects.

In most cases with side effects, a reduction in dosage followed by a more gradual adjustment upward will result in a more accurate indication of the patient's dosage requirements without the appearance of side effects.

Dosage and Administration: The activity of a 0.1 mg. SYNTHROID (sodium levothyroxine) TABLET is equivalent to approximately one grain thyroid, U.S.P. Administer SYNTHROID tablets as a single daily dose, preferably after breakfast. In hypothyroidism without myxedema, the usual initial adult dose is 0.1 mg. daily, and may be increased by 0.1 mg. every 30 days until proper metabolic balance is attained. Clinical evaluation should be made monthly and PBI measurements about every 90 days. Final maintenance dosage will usually range from 0.2-0.4 mg. daily. In adult myxedema, starting dose should be 0.025 mg. daily. The dose may be increased to 0.05 mg. after two weeks and to 0.1 mg. at the end of a second two weeks. The daily dose may be further increased at two-month intervals by 0.1 mg. until the optimum maintenance dose is reached (0.1-1.0 mg. daily).

Supplied: Tablets: 0.025 mg., 0.05 mg., 0.1 mg., 0.15 mg., 0.2 mg., 0.3 mg., 0.5 mg., scored and color-coded, in bottles of 100 and 500. Injection: 500 mcg. lyophilized active ingredient and 10 mg. of Mannitol, N.F., in 10 ml. single-dose vial, with 5 ml. vial of Sodium Chloride Injection, U.S.P., as a diluent.

SYNTHROID (sodium levothyroxine) INJECTION may be administered intravenously utilizing 200-400 mcg. of a solution containing 100 mcg. per ml. If significant improvement is not shown the following day, a repeat injection of 100-200 mcg. may be given.

Morton Grove, Illinois 60053

Doctor Watson exposes a double agent

og on the Embankment. Two figures emerge into silhouette against a aloed street lamp. The flare of a match reveals the profile of Sherlock olmes. As he lights his calabash, his companion speaks:

By Jove, Holmes, that amazing intuition of yours has proved right gain. What we're looking for is a single entity. I thought we were caling with several others—even twins. But now—I'd say we've ncovered a double agent."

Tell me more, Watson, and be quick about it!"

Watson withdraws a folded paper from inside his greatcoat, and ads aloud from it):

The key to the whole cypher is SYNTHROID (sodium levothy-xine)"...

Shhh! Watson, not so loud! You'll alert our quarry."

Watson continues): "A single entity that serves two functions."

A master stroke, Watson."

Follow along, Holmes. In the neighborhood of 95% of the circulat-g thyroid hormone is levothyroxine—T_4 as you call it. T_4 is bound thyroxine-binding proteins in the serum. It becomes available only adually to tissue cells—as free thyroxine."

"Is that why there's such a smooth, predictable response, Watson?"

"Quite! With agent T_4, SYNTHROID, the chances of a precipitous rise in metabolic rate are lessened."

"But how does 'free' thyroxine fit into the picture?"

"Well, Holmes, you might call it the tissue thyroid hormone—because 'free' thyroxine (that is, thyroxine not bound to protein) is active at the tissue level. It is gradually released from thyroxine-binding proteins. Each daily dose of SYNTHROID is mostly bound to thyroid-binding proteins, and slowly released as 'free' thyroxine—the form in which it is metabolically active."

"Magnificent, Watson! So protein-bound thyroxine is the major form of circulating thyroid hormone, and it is released as 'free' thyroxine. And that's why SYNTHROID is able to simulate the normal process so artfully. Q.E.D."

"Not so fast, Holmes. SYNTHROID works for the *physician*, too. Because its dosage is more precisely controllable, and because response is so smooth and predictable, the *doctor* gets fewer phone calls in the wee hours from agitated patients. Both parties get more sleep!"

"Comforting, my dear doctor, to know that SYNTHROID, the 'single agent,' cleverly does the job of two."

Synthroid® (sodium levothyroxine)

Frederick County Medical Society

Meeting Notes

Ernest A. Dettbarn, MD, Journal Representative

Reactivation of the county medical society scholarship fund; endorsement of the goals of the Frederick County Ambulance and Rescue Service with an urgent appeal to the county commissioners to give financial support to this service; and a vote of support FOR the proposed liberalization of the abortion laws by the society highlighted the actions taken at the March dinner-meeting of the Frederick County Medical Society.

Guest speaker for the evening's meeting, held this month at the Francis Scott Key Hotel, was Mr. Richard F. Crombie, Director of the Frederick County Planning and Zoning Commission. In reviewing the "Future of Frederick County", he made it quite clear that projected population increases would require increased public services, especially medical services. His predictions were based on the fact that between 1950-1960 there was a 15.5% increase in the county population, and as it stands now, there will probably be a 27% increase for the decade 1960-1970. Considering the increasing number of industries interested in Frederick County, with its outstanding desirability for living and working, and the fact that already there are plans for vast developments, Mr. Crombie urged that the county medical society conduct a careful survey of presently existing medical facilities as a basis for future planning.

The advice of the speaker was well received by the large number of members in attendance. Mr. Crombie was pleased to learn that the society had already established a Physician Procurement Committee led by George Smith, MD, and a committee to study the delivery of health services of the county headed by John Harvey, MD.

The society was informed by Robert Roberts, MD, of his committee's work with the directors of the Frederick County Ambulance and Rescue Service. He reported that only one unit in the county received any financial support from the county. Recognizing the increasing cost of operating the many volunteer services and the difficulty in raising sufficient funds by dinners, carnivals, etc., the society urged that funds be included in the next county budget to help support these volunteer units whose services were so valuable to the people of the county.

The society president, A. M. Powell, MD, called upon B. O. Thomas, Jr., MD, chairman of the medical scholarship committee, to present his committee's plans for reactivation of the scholarship fund. Dr. Thomas' committee recommended that a grant of $1,000 be made available each year for a Frederick County resident who needs financial help with his medical school expenses. The society would make this amount available from its funds and it would not have to be paid back provided the person receiving the grant would practice for at least two years in Frederick County. The society endorsed this proposal.

Charles Spicknall, MD, local health officer, informed the members of the increased number of cases of rubeola in a nearby community and the efforts his department was making to contain these cases, including a mass immunization program in the immediate area and surrounding areas for those who were not previously protected. The members present were also alerted to the side effects being seen in some youngsters who received the rubella vaccine. These included aches and pains in the arms and legs somewhat resembling the symptoms of rheumatic fever. These side effects, reported by Edward Koenigsburg, MD, were not serious or long-lasting, but until their cause had been determined, they were of some concern to some local physicians and parents.

President Powell expressed the feeling of mourning of the society on the passing of member emeritus, J. G. F. Smith, MD, of Brunswick. It was just last year that the Med-Chi had honored him with a plaque for 54 years of medical practice.

The remainder of the meeting was devoted to a discussion of the termination of pregnancy. The society passed a motion, with but one dissenting vote, in support of a liberalization of the abortion laws and instructed its president to send a telegram to the Governor expressing our support of the abortion bill before the legislature.

Schering

After only one year:

Administered to more people than live in Dundalk, Annapolis, and Bethesda.*

Injectable
Garamycin®
brand of gentamicin sulfate injection

*An estimated 208,000 patients have received GARAMYCIN Injectable to date. The combined population of Dundalk, Annapolis, and Bethesda is 193,500. (Estimated 1969 figures from The New York Times Encyclopedic Almanac 1970.)

See Clinical Considerations section on last page...

Mounting acceptance in the hospital...

Proven clinical effectiveness

Respiratory Infections

Outstanding results in serious gram-negative respiratory infections[1,2]

GARAMYCIN Injectable may prove successful where other antibiotics have failed.

Urinary Tract Infections

Strikingly effective in selected urinary tract infections[3]

With relatively low intramuscular doses, the promptly attained levels of GARAMYCIN achieved in the urine are considerably higher than the concentrations required for effectiveness against virtually all susceptible gram-negative pathogens. (Appropriate precautions are indicated in patients with impaired renal function; consult Package Insert for full details.)

Septicemia

May be lifesaving[4-6]

Numerous investigators have drawn attention to the value of GARAMYCIN Injectable in the treatment of gram-negative septicemias, often complicated by shock. Many hospital strains of *Serratia* are susceptible.[6]

Wounds and Burns

Response may be dramatic in wounds and burns complicated by sepsis[7]

The established efficacy of GARAMYCIN Injectable against *Pseudomonas*—as well as most other gram-negative pathogens—makes it an especially useful agent in the treatment of infected wounds and burns.

Important Precautionary Note Patients receiving treatment with GARAMYCIN Injectable (gentamicin sulfate injection) should be under close clinical observation because of the toxicity associated with the use of the drug. Ototoxicity, vestibular and auditory, can occur in patients, primarily those with preexisting renal damage, treated with GARAMYCIN Injectable for longer periods or with higher doses than recommended.

GARAMYCIN Injectable is potentially nephrotoxic, and this should be kept in mind when it is used in patients with preexisting renal damage.

This drug should be limited to the treatment of serious infections caused by susceptible gram-negative bacteria, with due regard for relative antibiotic toxicity. (See Clinical Considerations section.)

Mounting evidence in the laboratory...

Schering

Over 95% gram-negative pathogens sensitive.*

No other antibiotic performed comparably *in vitro* against gram-negative pathogens.
In a nationwide culture audit of antibiotic sensitivity patterns, sensitivity reports from 106 hospitals, geographically representative by census tract and of varying sizes, were analyzed. During the three-month period, ***every*** gram-negative culture slip from ***every*** hospital was surveyed. The total number of cultures involved in the audit was 97,091. The total number of sensitivity determinations was 643,503.

Pathogens	Percentage of sensitive strains Number of strains tested Antibiotics*							
	Garamycin	Kanamycin	Cephalothin	Cephaloridine	Ampicillin	Colistimethate	Chloramphenicol	Tetracycline
Klebsiella pneumoniae	99.5% 962	84.7% 992	86.2% 995	76.1% 67	32.7% 1,020	96.3% 640	82.9% 1,028	77.1% 1,026

Paracolobactrum, all	93.4% 303	88.9% 325	62.0% 305	74.2% 62	43.8% 340	80.9% 215	87.1% 350	72.6% 340
Coliform bacteria	99.0% 593	91.2% 649	81.5% 637	66.7% 21	52.7% 624	95.6% 607	91.6% 678	76.1% 637
Totals	95.1% 30,830	80.5% 31,606	65.3% 31,229	68.1% 10,083	50.3% 31,496	75.8% 25,829	79.7% 32,606	56.5% 31,070
Gram-positive (included for consistency with Package Insert, not an approved indication)								
Staph—*S. aureus*, coagulase-positive	97.4% 1,548	88.8% 1,458	97.7% 2,050	98.7% 636	61.1% 1,559	20.4% 628	94.4% 2,123	83.7% 1,966
Staph—*S. aureus*, unspecified	99.3% 993	92.8% 902	98.1% 1,289	95.3% 213	45.8% 1,153	29.3% 116	96.4% 1,427	82.3% 1,360

*Adapted from a three-month, nationwide hospital audit by R. A. Gosselin and Co., Inc., Dedham, Massachusetts (mid-May to mid-August,1969).[8]
Antibiotics with significant gram-negative spectra are included. Organisms are listed as reported by laboratory.
Sensitivity testing was done by the disc method, a generally reliable test in the hospital setting. It should be noted, however, that the results with GARAMYCIN were somewhat higher than the results reported where the tube dilution technique was used. (See Clinical Considerations section which follows.) The concentration of the GARAMYCIN disc was 10 mcg.
Whereas standard testing methods were used by all hospitals, it is acknowledged that in a survey of this kind considerations such as differences in methodology are possible sources of error. The comparative percentage-sensitivity results derived from a survey of this kind are, therefore, not absolute. One should keep in mind also that the proper selection of an antibiotic is based not only on susceptibility testing but on relative toxicity and other clinical considerations as well.
It is felt, nonetheless, that the broad scope of the survey and the extreme care in data collection and tabulation permit a conclusion that the results are *generally* representative of current nationwide antibiotic sensitivity patterns.

Injectable Garamycin®
brand of gentamicin sulfate injection

See Clinical Considerations section on last page...

Injectable Garamycin®

brand of gentamicin sulfate injection

ADULT DOSAGE GUIDELINES

See definitive prescribing information in Package Insert.

Patients with Normal Renal Function

Total Daily Dose (administered in two, three, or four divided doses)			
	Less Severe	Resistant/ Moderately Severe	Serious/Life-Threatening
Urinary Tract Infections (due to susceptible strains of gram-negative bacteria)†	0.8-1.2 mg./kg. for 7-10 days	Larger doses or additional antibacterial therapy should be considered in severe urinary tract infections or in resistant cases involving the renal parenchyma or anatomic anomaly.	up to 5 mg./kg.
Other Infections including bacteremia, infected surgical wounds, severe soft tissue infections, and respiratory tract infections (due to susceptible strains of gram-negative bacteria)	3 mg./kg. for 7-10 days		

†Alkalinization of the urine may be a useful therapeutic adjunct.

Patients with Impaired Renal Function

To minimize the risk of ototoxicity in patients with impaired kidney function, only the first dose should be that normally recommended. Each subsequent dose should be half or less of that recommended for patients with normal renal function, depending upon the degree of renal impairment.

In patients with renal failure who are undergoing 14-hour hemodialysis twice weekly, administration of 1 mg./kg. GARAMYCIN Injectable at the end of each dialysis period has been suggested.

Clinical Considerations

Indications: GARAMYCIN Injectable is clinically effective in infections due to susceptible strains of gram-negative bacteria, including *Pseudomonas aeruginosa,* and species of indole-positive and indole-negative *Proteus, Escherichia coli,* and *Klebsiella-Aerobacter.* Bacteriologic studies should be conducted to identify the causative organism and to determine its sensitivity to gentamicin sulfate. Sensitivity discs of the drug are available for this purpose. If the susceptibility tests indicate that the causative organism is resistant to gentamicin sulfate, other appropriate antibiotic therapy should be instituted.

IN VITRO INHIBITION OF CLINICALLY IMPORTANT BACTERIA BY GENTAMICIN SULFATE (TUBE DILUTION STUDIES)

BACTERIA	No. of Strains Tested	No. of Strains (%) Inhibited by: 4 mcg./cc. or less		8 mcg./cc. or less*		No. of *In Vitro* Studies
Staphylococcus aureus	1,210	1,200	(99%)	1,206	(99%)	11
Pseudomonas aeruginosa	885	771	(87%)	828	(93%)	16
Escherichia coli	836	736	(88%)	779	(93%)	11
Indole-positive and indole-negative *Proteus* species	477	210	(44%)	358	(75%)	12
Klebsiella-Aerobacter species	292	205	(70%)	231	(79%)	10

*Number of strains (%) of gram-negative bacteria inhibited by 10 mcg./cc. or less are as follows: *Pseudomonas aeruginosa,* 828 (93%); *Escherichia coli,* 792 (95%); *Proteus* species, 393 (82%); *Klebsiella-Aerobacter* species, 284 (97%). From same studies as above.
Source: Package Insert

This drug should be limited to the treatment of serious infections caused by gram-negative bacteria, particularly *Pseudomonas aeruginosa, Proteus* and other susceptible organisms, with due regard for relative antibiotic toxicity. Therefore, the drug should be considered for use against gram-negative: 1. Bacteremia; 2. Infected surgical wounds; 3. Severe soft tissue infections, including burns complicated by sepsis; 4. Respiratory tract infections; and 5. Selected cases of urinary tract infection.

Contraindications: GARAMYCIN Injectable is contraindicated in individuals with a history of hypersensitivity or toxic reactions to gentamicin.

Warnings: Patients receiving treatment with GARAMYCIN should be under close clinical observation because of the toxicity associated with the use of this drug. Ototoxicity, vestibular and auditory, can occur in patients, primarily those wit pre-existing renal damage, treated with GARAMYCIN Injectabl usually for longer periods or with higher doses than recommende

GARAMYCIN Injectable is potentially nephrotoxic, and thi should be kept in mind when it is used in patients with pre-existin renal impairment. Kidney function diminished by infection of th upper urinary tract may, however, improve during effective trea ment with GARAMYCIN Injectable.

Concurrent administration of potentially ototoxic drugs such a streptomycin and kanamycin or of potentially nephrotoxic dru such as polymyxin, colistin, and kanamycin with gentamicin sulfat has not been shown to afford any clinical advantages and, moreov may result in additive toxicity. Monitoring of vestibular, cochlea and renal function will provide guidance for therapy in such case

Precautions: In patients with impaired renal function in whor serious infection develops, serum concentrations of the drug ma rise, with consequently increased risk of ototoxicity. In these pa tients or in those in whom recommended dosage or duration o therapy must be exceeded as a life-saving measure, routine studi of kidney function should be performed when possible. These ma be supplemented by evaluation of the vestibular and auditory fun tion and measurement of serum concentration of the drug whe feasible. Serum concentrations of gentamicin should be maintaine below the range of 10-12 mcg./ml. to reduce risk of ototoxicity.

Ordinarily, treatment should not be given for more than 7 to 1 days or be repeated unless required for serious infection not r sponsive to other agents.

As with other antibiotics, treatment with GARAMYCIN Injectab may occasionally result in overgrowth of nonsensitive organisms. superinfection occurs, appropriate therapy is indicated.

Safety for use in pregnancy or the potential for fetal ototoxicity nephrotoxicity have not been established. Studies in pregnant an mals have not revealed teratogenic or ototoxic effects in the fetu GARAMYCIN Injectable should not be used in pregnant patients in women of childbearing age unless its use is deemed advisab by the physician.

Adverse Reactions: The overall incidence of ototoxicity considere related to treatment with GARAMYCIN Injectable was 2.8 per ce (16 of 565 patients). Contributory factors (two or more factors we relevant to most patients) were as follows: 10 had azotemia, received a total of 1 gram or more of the drug, 7 had recently r ceived other potentially ototoxic antibiotics (streptomycin or kan mycin), and 5 were over 60 years of age. Six also had decreas high-tone hearing acuity, which returned to or toward normal the 4 patients retested.

Analysis of BUN data indicated that 4 (2%) of 172 patients show increases in BUN that were probably related to treatment wi GARAMYCIN Injectable. Of 20 increases probably or possibly relat to treatment, 7 were reversible, 9 occurred in terminal patients, a 4 had no follow-up.

Other adverse reactions associated with treatment were one instar each of urticaria, decreased hematocrit, and reversible depressi of granulocytes with normal bone marrow. Other rarely report and possibly treatment-related adverse reactions were anemia, creased reticulocyte count, rash, purpura, drug fever, hypotensi convulsions, twitching, salivation, nausea, vomiting, increased tra aminase activity (SGOT or SGPT), increased serum bilirubin, creased serum calcium, and joint pain.

Packaging: GARAMYCIN Injectable, 40 mg./cc., 2-cc. multiple-d vials, for intramuscular administration.

Book Reviews

DRUGS OF CHOICE, 1970-71, Walter Modell, MD, ed.; The C. V. Mosby Company, St. Louis, Missouri, 1969.

Many well-known authorities have contributed to this book, which helps the physician to select the best drug for a specific therapeutic problem. It combines knowledge from all the various specialities which, if published previously, has been published separately. The opinions of experts provide the physician with a comprehensive source of clear, concise, authoritative, and practical answers when faced at a critical moment with choosing the right drug.

It is a well-documented publication, adequately indexed and cross-referenced for quick and easy use.

EMPHYSEMA, A Doctor's Advice for Patients and Their Families, Fred A. Obley, MD; Beacon Press, Boston, Massachusetts, 1970.

This book is written in the language that a physician would use in explaining this chronic respiratory disease to his patient. It contains practical, detailed information and helpful exercises for the patient to be used in full cooperation with his physician.

Anyone who smokes or who coughs chronically should read this book. The diagnosed emphysemic should read it a second time and keep it on his shelf for ready reference.

DISEASES OF BONE AND JOINTS, Louis Lichenstein, MD; The C. V. Mosby Company, St. Louis, Missouri, 1970.

This book serves as a companion volume to *Bone Tumors* by the same author. It deals with skeletal disease in general, apart from neoplasms, and provides a concise yet informative comprehensive survey for basic orientation. As such, it meets the needs of orthopedists, general surgeons, radiologists, pathologists, pediatricians, internists and almost any physician, whatever his specialty.

It is a volume that should at least be skimmed by any physician who wishes to keep up to date in his knowledge in this area.

DROWNPROOFING

Teach your child drownproofing.

Drownproofing, according to the Health Insurance Institute, consists of a series of arm and leg movements that help a person move up and down instead of forward.

Detailed instructions for teaching this technique to youngsters are now being provided on a new wallet-sized card published free of charge by the U.S. Public Health Service.

If performed correctly, reports the PHS, it will allow a child to survive in the water for hours, even if it is rough.

The PHS card, "Safety Tips In-Out-and-Around the Water" may be obtained free in quantities up to 100 by writing to the Injury Control Program, National Center for Urban and Industrial Health, 222 East Central Parkway, Cincinnati, Ohio 45202.

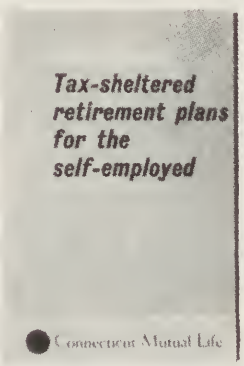
Should You Incorporate?

Maybe Yes.

The present I.R.S. position boils down to this: When you become an employee of your own professional corporation or association, a lot of good things can happen. For one thing, you may cut your income tax. For another, you can beef up your retirement investments with more tax-sheltered dollars.



After reading our booklet, "Professional Corporation Tax Benefits," you may well decide to explore the matter further with your attorney or tax accountant.

Maybe No.

There could be several reasons why the idea of incorporation doesn't fit your current picture. If so, all the more reason for you not to miss out on Keogh Plan advantages.

This plan gives you several tax benefits. Like tax-deductible contributions. And tax-sheltered accumulations of your retirement nest-egg. The full story is waiting for you in our booklet, "Good News."

Send now for a copy of either informative booklet. Explore these opportunities for saving money. But remember, you won't get the tax benefits unless you do *something*. The coupon below is your first step.

MINUTES

First Meeting, 172nd Annual Session, House of Delegates
(268th Meeting)
Medical and Chirurgical Faculty of the State of Maryland
Wednesday, April 1, 1970
The Alcazar, Baltimore, Maryland

The 268th meeting, first of the 172nd Annual Session, of the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland was called to order at 9:40 AM, Wednesday, April 1, 1970, at The Alcazar, Baltimore, Maryland, the President and Secretary being present.

The following delegates (or alternates) were registered as being in attendance; an asterisk indicates an alternate delegate.

Doctors: Robert T. Adkins, Wicomico County; Manning W. Alden, Council; Robert G. Angle, Montgomery County; Charles Bagley, III, Wicomico County; Timothy D. Baker, Baltimore city; John G. Ball, Council; James W. Banks, Washington County; George S. Banning, Prince George's County; Richard D. Bauer, Past President; Wilbur N. Baumann, Dorchester County; Emidio A. Bianco, Baltimore city; * Norman K. Bohrer, Prince George's County; Francis J. Borges, Baltimore city; * Katherine H. Borkovich, Baltimore city; M. McKendree Boyer, Past President; Douglas G. Carroll, Baltimore city; Katharine A. Chapman, Montgomery County; John T. Chissell, Council; John N. Classen, Baltimore city; Archie R. Cohen, Washington County; * Joseph R. Cowen, Baltimore city; Kenneth Cruze, Montgomery County; William B. Culwell, Carroll County; Worth B. Daniels, Jr., Baltimore city; H. Vincent Davis, Cecil County; John B. De Hoff, Baltimore city; DeWitt E. DeLawter, Montgomery County; J. Sheldon Eastland, Past President; William Carl Ebeling, Council; Wolcott L. Etienne, Council; George G. Finney, Jr., Baltimore city; Vincent J. Fiocco, Carroll County; Whitmer B. Firor, Past President; * Ronald H. Fishbein, Baltimore city; Elliott R. Fishel, Baltimore city; Russell S. Fisher, President; * Abraham Genecin, Baltimore city; Robert B. Goldstein, Baltimore city; E. Gordon Grau, Baltimore County; George H. Greenstein, Baltimore city; Paul F. Guerin, Council; William B. Hagan, Council; John C. Harvey, Council; William G. Helfrich, Baltimore city; Thomas F. Herbert, Howard County; Philip W. Heuman, Harford County; * Edward O. Hunt. Jr., Baltimore city; Ferd E. Kadan, Baltimore city; Arthur T. Keefe, Jr., Council; Robert C. Kimberly, Council; Seruch T. Kimble, Council; Edward L. J. Krieg, Baltimore County; Henry P. Laughlin, Council; C. Rodney Layton, Queen Anne's County; Charles H. Ligon, Montgomery County; Elmer G. Linhardt, Board of Medical Examiners; Deonis M. Lupo, Baltimore city; Charles B. Marek, Baltimore city; Francis C. Mayle, Jr., Montgomery County; Wm. E. McGrath, Baltimore County; Karl F. Mech, Council; B. Martin Middleton, Council; Donald W. Mintzer, Baltimore city; Andrew C. Mitchell, Wicomico County; Marvin I. Mones, Council; Samuel Morrison, Council; C. Herbert Mueller, Jr., Baltimore County; * Neil Novin, Baltimore city; Charles F. O'Donnell, Past President; * Malcolm D. Phillips, Harford County; William A. Pillsbury, Jr., Council; Thaddeus E. Prout, Baltimore city; * Belden R. Reap, Montgomery County; J. Morris Reese, Past President; William F. Renner, Baltimore city; Donald J. Roop, Council; Harry Paul Ross, Kent County; John F. Schaefer, Council; * Marvin M. Schuster, Baltimore city; Margaret L. Sherrard, Baltimore County; Arthur G. Siwinski, Past President; R. Kennedy Skipton, Prince George's County; Gordon M. Smith, Montgomery County; Roland T. Smoot, Baltimore city; Aaron C. Sollod, Baltimore city; William G. Speed, III, Council; George R. Spence, Montgomery County; Robert J. Thomas, Council; Chris P. Tountas, Baltimore city; Francis J. Townsend, Jr., Worcester County; John B. Umhau, Montgomery County; Thomas E. Van Metre, Jr., Baltimore city; * Baltasar B. Velez, Baltimore County; Emerson C. Walden, Baltimore city; Hugh W. Ward, Calvert County; J. Arthur Weinberg, Council; Lawrence R. Wharton, Jr., Baltimore city; Charles E. Wright, Frederick County; * N. Louise Young, Baltimore city; Raymond M. Yow, Council. Present also were staff members.

INVOCATION

Karl F. Mech, MD, delivered the invocation.

ANNOUNCEMENTS

The President made certain announcements with regard to the conduct of business at the session.

MINUTES

The minutes of the House of Delegates Semi-annual Session, Hershey, Pa., on September 5, 1969; and the Special Session, held at Baltimore, Md., on December 13, 1969, having been distributed to members and having been approved by the Executive Committee, were presented to the House for information.

INTRODUCTION OF GUESTS

Maynard P. Pride, MD, president of the West Virginia Medical Association; and William A. Barrett, MD, president of the Pennsylvania Medical Society, were introduced to the House and spoke briefly.

NECROLOGY

After the Secretary read the following names of deceased members, the members of the House of Delegates rose in observance of a moment's silence in respect for their deceased colleagues:

SPECIAL RECOGNITION OF DECEASED MEMBERS

John F. Schaefer, MD, Council Chairman, offered the following resolution in memory of a distinguished member who had died during the previous year, which was adopted unanimously:

ROBERT W. JOHNSON, JR., MD, 1891-1969

Whereas, Robert W. Johnson, Jr., MD, died on August 24, 1969; and

Whereas, As the initiator of many progressive reforms in the area of biomedical research, he gave courage and support to developing competent physician-scientists before their creative abilities were hindered by academic responsibilities; and

Whereas, His foresight enabled institutions to recognize and direct their efforts toward postdoctoral training programs; and

Whereas, As an interested member of more than fifty years of the Medical and Chirurgical Faculty and the Baltimore City Medical Society, and an avid supporter of their activities; and

Whereas, As the father of two distinguished Maryland physicians; and

Whereas, His generosity, gentleness, and forthrightness in dealing with the challenges presented to him during his lifetime were truly exemplary qualities; and

Whereas, His distinguished record of accomplishments and his devotion to the profession endeared him to all, be it therefore

Resolved, That a copy of this resolution be sent to the relatives of Robert W. Johnson, Jr., MD, with the notation that this recognition of his efforts on behalf of the Faculty are in this small way hereby acknowledged.

HONORARY MEMBERSHIP

John F. Schaefer, MD, escorted W. B. Kouwenhoven, Dr.Ingr., MD (Hon.) to the podium and read the following certificate of Honorary Membership in the Faculty:

FOR HIS OUTSTANDING CONTRIBUTIONS TO THE PRACTICE OF MEDICINE AND THE GENERAL WELL-BEING OF HUMANITY

PRESENTATION OF FIFTY-YEAR PINS

The President awarded Fifty-year pins to the following members who were present for the meeting:

Baltimore City:	Leslie N. Gay, MD Louis F. Krumrein, MD F. Fred Ruzicka, MD Austin H. Wood, MD
Allegany County:	Howard L. Tolson, MD

Other physicians completing fifty years of Faculty membership but who could not be present were:

Baltimore City:	Zachariah R. Morgan, MD John G. Murray, MD
Baltimore County:	Lee K. Fargo, MD
Carroll County:	Charles L. Billingslea, MD

EMERITUS MEMBERSHIP

On motion of the Chairman of the Council, Dr. Schaefer, the following members who had received the recommendation of their respective societies and the Council, were elected to Emeritus Membership in the Faculty:

Baltimore City Medical Society:
Melvin H. Crocker, MD
Walter E. Fleischer, MD
Ralph S. Penner, MD
Alexander J. Schaffer, MD
Joseph Sindler, MD
Harry B. Smith, MD
William S. Stone, MD

Baltimore County Medical Association:
William E. Martin, MD, Harrisonville
William H. F. Warthen, MD, Baltimore

Carroll County Medical Society:
Charles L. Billingslea, MD, Westminster

Montgomery County Medical Society:
Paul N. Fleming, MD, Silver Spring
Paul V. Starr, MD, Takoma Park

COMMENTS OF THE PRESIDENT

Dr. Fisher, as President, then made extemporaneous remarks on various problems facing the profession today, involving Medicare and Medicaid matters; the importance of Peer Review activities; and the professional liability insurance problem.

ACTION DEFERRED ON RESOLUTIONS

Action was postponed by unanimous consent until the Friday meeting on the following two resolutions referred to the House of Delegates by the Council, which had received them from the Prince George's County Medical Society:

Part I That the Faculty be requested to work for legislative changes through the General Assembly of the State of Maryland by virtue of which the defendant in torts would be permitted to have the final option as to whether he would be tried before a Judge or a Jury

Part II That the Faculty be requested to work for legislative changes through the General Assembly of the State of Maryland seeking to have the *contingent* fee method of payment between attorney and client made illegal.

MARYLAND MEDICAL POLITICAL ACTION COMMITTEE

George G. Finney, Jr., MD, Chairman of the Maryland Medical Political Action Committee, spoke briefly on the activities of that group during the past year. *(For a complete report of this committee's activities see page 67.)*

TREASURER'S REPORT AND 1970 BUDGET

Karl F. Mech, MD, Treasurer, presented the 1970 budget for the information of the House, this having been adopted by the Council. The Treasurer advised that the Faculty's finances had been audited and that the printed audit would be available for the Semiannual session. *(See pages 81-95)*

MEDIC NETWORK 1970/71

Fred Heldrich, MD, subcommittee chairman, presented the following motion, which after amendment was adopted as follows:

> That the MEDIC Network be continued and that such funds to the extent of $16,000 be appropriated to finance the operation of the system for a one-year period, in order to produce stability and enable proper planning of programs of desired quality.

An additional motion was offered and adopted as follows:

> That a formal evaluation of the MEDIC program be made available when this item is up for consideration again.

BYLAWS COMMITTEE REPORT

Charles F. O'Donnell, MD, Chairman of the Bylaws Committee, on its behalf, moved the adoption of certain Bylaw amendments which, after debate, were adopted in each case by more than the required two-thirds vote. *(See pages 58-62 for the complete report.)*

MEDICOLEGAL CODE OF COOPERATION AMENDMENT

Belden R. Reap, MD, on behalf of the Medicolegal Committee offered the following amendment to the Medicolegal Code of Cooperation, which was adopted:

> "Upon engaging a physician for consultation, evaluation and/or testimony, the attorney should make it clear whether the patient or the attorney will be responsible for payment of the fee."

The addition will be made to the paragraph entitled "Payment for Medical Services Rendered."

MEDIATION COMMITTEE REPORT DEFERRED

Action on the Mediation Committee Report was postponed by general consent to the Friday House of Delegates meeting.

NOMINATING COMMITTEE REPORT

Arthur G. Siwinski, MD, Nominating Committee Chairman, presented the committee's slate. *(See page 73 for details.)*

The floor was opened to further nominations for these offices and there being none, nominations were closed by general consent, the election to be held at the second meeting of the session, Friday, April 3, 1970, at the Faculty Building. The nominees for the Board of Medical Examiners are to be elected at the General Session, Thursday, Noon, April 2, 1970, at The Alcazar.

The Chair announced that technical problems prevented the printing of the Annual Reports in sufficient time for consideration at the Annual Meeting. These will be made available at the Semiannual Session. *(See pages 56-97 for Annual Reports.)*

LEGISLATIVE COMMITTEE REPORT

B. Martin Middleton, MD, was asked to speak briefly on the recently adjourned legislative session. He mentioned various bills adopted or rejected by the General Assembly.

The House of Delegates gave a rising vote of thanks to Dr. Middleton for his efforts in this regard.

There being no further business, at Noon the President made certain announcements and declared the House adjourned until 2:00 PM Friday, April 3, 1970 at the Faculty building.

WILLIAM A. PILLSBURY, MD, *Secretary*

Second Meeting, 172nd Annual Session, House of Delegates
(269th Meeting)
Medical and Chirurgical Faculty of the State of Maryland
Friday, April 3, 1970
Faculty Building, Baltimore, Maryland

The 269th meeting, second of the 172nd Annual Session, of the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland was held at the Faculty Building, 1211 Cathedral St., Baltimore, Maryland, at 2:00 PM on Friday, April 3, 1970, the President and Secretary being present.

The following delegates (or alternates) were registered as being in attendance; an asterisk indicates an alternate delegate:

Doctors:

Robert T. Adkins, Wicomico County; Manning W. Alden, Council; Robert G. Angle, Montgomery County; Charles Bagley, III, Wicomico County; John G. Ball, Council; George S. Banning, Prince George's County; Richard D. Bauer, Past President; Wilbur N. Baumann, Dorchester County; Emidio A. Bianco, Baltimore city; Francis J. Borges, Baltimore city; *Katherine H. Borkovich, Baltimore city; Samuel Borssuck, Anne Arundel County; M. McKendree Boyer, Past President; Henry A. Briele, Council; Douglas G. Carroll, Baltimore city; John N. Classen, Baltimore city; Archie R. Cohen, Washington County; *Joseph R. Cowen, Baltimore city; William B. Culwell, Carroll County; Worth B. Daniels, Jr., Baltimore city; John B. De Hoff, Baltimore city; DeWitt E. DeLawter, Montgomery County; J. Sheldon Eastland, Past President; *John F. Eyring, Baltimore city; George G. Finney, Jr., Baltimore city; Vincent J. Fiocco, Carroll County; Elliott R. Fishel, Baltimore city; Russell S. Fisher, President; Gina M. Glick, Allegany County; Marvin Goldstein, Baltimore city; Robert B. Goldstein, Baltimore city; George H. Greenstein, Baltimore city; William B. Hagan, Council; John C. Harvey, Council; William G. Helfrich, Baltimore city; Philip W. Heuman, Harford County; *A. Clark Holmes, Prince George's County; Ferd E. Kadan, Baltimore city; William H. Kammer, Jr., Baltimore city; Seruch T. Kimble, Council; Edward L. J. Krieg, Baltimore County; Herbert H. Leighton, Garrett County; Charles H. Ligon, Montgomery County; Elmer G. Linhardt, Board of Medical Examiners; Francis C. Mayle, Jr., Montgomery County; Wm. E. McGrath, Baltimore County; Karl F. Mech, Council; B. Martin Middleton, Council; Donald W. Mintzer, Baltimore city; Andrew C. Mitchell, Wicomico County; Marvin I. Mones, Council; Samuel Morrison, Council; Charles F. O'Donnell, Past President; Hilary T. O'Herlihy, Anne Arundel County; William A. Pillsbury, Jr., Council; *Richard H. Pollen, Montgomery County; Thaddeus E. Prout, Baltimore city; J. Morris Reese, Past President; Guy M. Reeser, Jr., Council; William F. Renner, Baltimore city; Donald J. Roop, Council; Harry Paul Ross, Kent County; Peter Santucci, Montgomery County; John F. Schaefer, Council; Margaret L. Sherrard, Baltimore County; Arthur G. Siwinski, Past President; R. Kennedy Skipton, Prince George's County; Gordon M. Smith, Montgomery County; Roland T. Smoot, Baltimore city; Aaron C. Sollod, Baltimore city; George R. Spence, Montgomery County; Francis J. Townsend, Jr., Worcester County; John B. Umhau, Montgomery County; Thomas E. Van Metre, Jr., Baltimore city; *Baltasar B. Velez, Baltimore County; Philip F. Wagley, Baltimore city; Hugh W. Ward, Calvert County; Wm. C. Weintraub, Prince George's County; Lawrence R. Wharton, Jr., Baltimore city; John G. Wiswell, Baltimore city; Raymond M. Yow, Council. Staff personnel were also present.

ELECTION OF OFFICERS

There being no candidates from the floor and there being only one candidate for each of the positions to be filled, by unanimous consent the ballot was dispensed with. The entire Nominating Committee's slate was then elected by voice vote.

ADDITIONAL ELECTION

Arthur G. Siwinski, MD, Nominating Committee Chairman, offered the name of Emmanuel A. Schimunek, MD, to fill the post of first vice-president, effective with the conclusion of the Annual Meeting, 1970, through the Annual Meeting, 1971. The vacancy in this post was created by the election of John F. Schaefer, MD, as President-elect.

There being no other nominations from the floor, the President declared the election of Dr. Schimunek unanimous.

BOARD OF MEDICAL EXAMINERS ELECTION

The President advised the House that members of the Board of Medical Examiners had been elected in a General Session held on Thursday, April 2, 1970, as follows:

William G. Stewart, MD, Westminster
Elmer G. Linhardt,, MD, Annapolis

COMMISSION ON MEDICAL DISCIPLINE

The President advised the House that the Chairman of the Commission on Medical Discipline had asked him to make a brief report to the House, regarding activities of the Commission to date.

PRINCE GEORGE'S COUNTY RESOLUTIONS

The President asked for a vote on consideration of the following motion received from the Prince George's County Medical Society too late to be considered by the Reference Committee. Lacking a two thirds vote for consideration of these motions, they were dismissed.

Part I That the Faculty be requested to work for legislative changes through the General Assembly of the State of Maryland by virtue of which the defendant in torts would be permitted to have the final option as to whether he would be tried before a Judge or a Jury.

Part II That the Faculty be requested to work for legislative changes through the General Assembly of the State of Maryland seeking to have the *contingent* fee method of payment between attorney and client made illegal.

MEDIATION COMMITTEE REPORTS

Louis J. Kolodner, MD, on behalf of the Mediation Committee, moved to rescind the action of the House of Delegates taken in 1962 which read as follows, and which was adopted after debate:

> "Podiatrists should not be on hospital staffs nor engaged in open surgery."

Dr. Kolodner, on behalf of the Mediation Committee, moved to adopt the following motion, which after debate and amendment, was adopted as follows:

That the Faculty adopt the same standards as

of January 1, 1970 with respect to Podiatrists as the Joint Commission on Accreditation of Hospitals.

STAFF RECOGNITION

Anna Wynde Leake, who attained forty years of service in the Faculty employ in 1969, was honored with the presentation of a gold chain and locket.

WOMAN'S AUXILIARY PRESIDENT

Mrs. Wallace H. Sadowsky, president of the Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland, requested permission of the House to speak. There being no objection, permission was granted.

Mrs. Sadowsky then read a report of Auxiliary activities during the past year.

REFERENCE COMMITTEE REPORT

Herbert H. Leighton, MD, on behalf of the Reference Committee, recommended that Resolution 1A/70 be adopted. The House adopted this Resolution.

Dr. Leighton, on behalf of the Reference Committee, moved adoption of Resolution 2A/70. The House adopted Resolution 2A/70.

Dr. Leighton, on behalf of the Reference Committee, moved adoption of Resolution 3A/70. The House adopted Resolution 3A/70. *(See Annual Reports pages 79-80 for Resolutions 1A/70, 2A/70, and 3A/70.)*

FUTURE POLICY ON PODIATRY

B. Martin Middleton, MD, Legislative Chairman, offered the following motion which was adopted after debate:

> That the House urges the Legislative Committee to use every effort to attempt to retain the present legal limits of Podiatric practices.

MEDIC PROGRAMS

Robert T. Adkins, MD, of Wicomico County, moved

> That the President of the Faculty appoint an Ad Hoc Committee to investigate all facets of the MEDIC network and render a report to the House of Delegates at the 1970 Semiannual Meeting, with such report being distributed to all House members in advance of such meeting.

This motion was adopted, after debate.

MEDICARE LIMITATIONS

Donald W. Mintzer, MD, Baltimore city, brought to the attention of the House that a recent communication from Blue Shield places a limitation on the number of house calls, nursing home visits, etc., that a physician can make for a Medicare patient and moved for adoption of the following motion which, after discussion, was referred to the Council:

> That the Faculty direct its members on the Blue Shield Board to work towards elimination of arbitrary restrictions on the number of visits a physician may make in treating his patients.

PROGRAM COMMITTEE INSTRUCTIONS

The House, by a two thirds vote, agreed to consider the following motion which, on consideration, the House adopted as follows:

> Whereas, The Program and Arrangements Committee of the Faculty works long and hard to obtain speakers of national prominence for Annual and Semiannual meetings, both current and past; and
>
> Whereas, The attendance at some of the meetings of the current Annual Session was embarrassingly small, and
>
> Whereas, The quality of the various endowed lectureships is endangered; and
>
> Whereas, The Alcazar's future is somewhat in doubt and its facilities are not what could be considered the most modern and attractive; therefore, be it
>
> *Resolved,* That the Program and Arrangements Committee be instructed by the House of Delegates to:
>
> (1) Explore the possibility of finding a more attractive facility for the location of the Annual Meetings, and
>
> (2) Explore any necessary methods to increase physical attendance of members and guests commensurate with the quality of the speakers.

RATIFY COUNCIL ACTION ON REPEAL OF ABORTION LAWS

Dr. Schaefer, on behalf of the Council, offered the following motion which was adopted after amendment by more than a two thirds vote:

> That the action of the Council be ratified in supporting repeal of all abortion laws in the State of Maryland and that the Faculty be represented at the public hearing in this regard scheduled by the Governor for *Wednesday, April 22, 1970, at 2:00 PM.

ANNOUNCEMENTS AND NEW PRESIDENT

The Chair then made certain announcements, following which the new President was introduced to the House.

The President, by general consent, declared the House adjourned SINE DIE at 3:30 PM.

** later changed to Thursday, April 23, 1970, at 9:00 AM.*

WILLIAM A. PILLSBURY, MD, *Secretary*

MEDICAL NEWS

Simeon B. Alvaran, MD, and **Karim F. Rashad, MD,** of Baltimore, and **John Cordozo Payne, MD,** of Seat Pleasant, members of the American Society of Anesthesiologists, were recently named Fellows of the College.

* * *

The newly elected chairman of the Maryland State School Health Council is **John M. Krager, MD,** a pediatrician and assistant health officer in the Baltimore County Health Department. Dr. Krager will serve a three-year term.

Other officers elected to the Council, an advisory group to the state departments of education and health, include Oscar Jensen, vice-chairman, an associate in higher education with the Maryland State Teachers Association; and Miss Joan M. Wolle, secretary, chief of the Division of Health Education with the State Department of Health and Mental Hygiene.

* * *

One in every 16 persons in Maryland has now completed the **Medical Self-Help Training** program, according to O. Eugene Trivits, chief of the Division of Emergency Health Services of the Maryland State Department of Health. In 1969, 56,468 Marylanders completed the program, bringing to 212,733 the total number of graduates since the program began in 1963.

Medical Self-Help is a program designed to provide information and training that will help prepare people for survival in time of a natural or national crisis when the services of a physician or other trained personnel are not available. The course covers techniques of artificial respiration, treatment of shock, and healthful living under emergency environmental conditions.

* * *

An Information Center for Handicapped Children, funded by the U. S. Office of Education, **Bureau of Education for the** handicapped, has opened in Washington, D. C. The new information, referral, and follow-up service provides a central source of information on facilities for the handicapped in the city and its suburbs. Such facilities include diagnostic clinics, special classes, recreation programs, parent organizations, and services for children who have mental, physical, or emotional handicaps.

Among the Center's services will be the revision and distribution of the *Directories of Services for Handicapping Conditions.* For a copy, write: Information Center for Handicapped Children, 1619 M Street, NW, Washington, D.C. 20036.

* * *

Under the leadership of **Emerson R. Julian, MD,** an intensive drive began April 1 to reduce the incidence of tuberculosis in Baltimore city.

Dr. Julian accepted chairmanship of the task force test program, which will run for six weeks. Two mobile chest X-ray units have been supplied by the City Health Department. The test program will concentrate on the inner city, spreading out from the Model Cities area and operating from 15 locations.

As chairman of the City Council's Health Committee, Dr. Julian said that despite advances in treatment, Baltimore still ranks third in the nation in new, active cases of tuberculosis.

* * *

Maryland's rubella immunization program is now in its sixth month, and over 200,000 of the estimated 630,000 eligible school children in the state have received the vaccine. Almost all Maryland counties are involved in the program, which will end with the current school year. According to Howard J. Garber, MD, Chief of the Division of Communicable Diseases, Maryland State Department of Health, over 70% of the children in the schools where programs have been conducted have received the rubella vaccine.

The campaign to vaccinate school children against the disease is an effort to forestall an epidemic of German measles that could occur as early as 1970-1971.

* * *

Beginning in July, the American Academy of Pediatrics will operate a permanent office in Washington, D. C. The Washington office is an extension of the AAP's Department of Government Liaison, which was established and approved by the Academy's Executive Board in April. It will work closely with major federal agencies and congressional committees to encourage the development of comprehensive child health programs.

Mr. George Degnon has been named director of the Department of Government Liaison.

* * *

After 57 years of practicing medicine, **Norbert C. Nitsch, MD,** has decided to retire for a second time.

Several years ago, at the mandatory retirement age of 70, Dr. Nitsch left his position as coroner for the Western District of Baltimore city and physician for the Baltimore City Police De-

partment and moved to Rock Hall to enjoy his retirement. However, he found such a critical need for the services of a physician in lower Kent County that he reluctantly resumed his practice.

Dr. Nitsch is a member of the Medical and Chirurgical Faculty, the AMA, the Maryland Academy of General Practice, and the Kent County Medical Society.

* * *

Among the guest speakers at the first meeting ever held for university hospital emergency department directors at the University of Alabama Medical Center in March was **Robert Rutherford, MD,** of The Johns Hopkins University in Baltimore.

* * *

David T. Crawford, MD, has been named to serve on the Advisory Council on Hospital Licensing.

Dr. Crawford, of the Franklin Square Hospital in Baltimore, will fill the remainder of a five-year term left vacant by Ross Z. Pierpont, MD, who recently resigned.

* * *

J. Alex Haller, MD, of Baltimore, will participate in the Ciné Clinic at the 1970 Clinical Congress of the American College of Surgeons to be held in Chicago in October. The topic of his motion picture will be pectus excavatum.

* * *

The cancer programs at several Maryland hospitals were recently surveyed. Approval of these hospital programs was based on the level of excellence in relation to the established standards of approval stated in the American College of Surgeons' *Manual for Cancer Programs.*

The goal of the approvals program is a coordinated cancer activities program anchored to a systematized cancer registry in each hospital. The following hospital programs received approval for three years, when they will be surveyed again: **Baltimore City Hospitals, Greater Baltimore Medical Center, The Johns Hopkins Hospital** (provisional), **Sinai Hospital of Baltimore, Union Memorial Hospital, U.S. Public Health Service Hospital,** and **University of Maryland Hospital,** all of Baltimore, and the **United States Naval Hospital** in Bethesda.

* * *

A poll taken during the recent Congressional hearing into oral contraceptives showed that 18% of the women surveyed had abandoned taking oral contraceptives. A more recent survey, however, shows that only 13% of those surveyed gave up the pill during the previous two months, and 69% intended to continue taking it. Moreover, 17% of the "dropouts" had already decided to go back on the pill within a year, while another 26% are undecided about returning. Of those who gave up oral contraceptives, 87% changed to some other birth control method.

* * *

Neil Solomon, MD, PhD, Secretary of Health and Mental Hygiene, has announced the approval of a plan by Bethlehem Steel to reduce the air pollution at its Sparrows Point plant. By updating and adding to existing environmental quality control facilities, all operations will be brought within the requirements of the state air pollution control regulations. The plan will be completed in 1973.

The Bethlehem plan for compliance is the eighth plan to be approved by the Department. Others include: Baltimore Gas and Electric Company, Potomac Electric Power Company, and the Western Electric Company.

* * *

A new 26-page handbook, *Tips on Athletic Training VIII,* is now available for team physicians working with young athletes in both high schools and colleges. The handbook is published under the auspices of the Committee on the Medical Aspects of Sports of the AMA.

It covers topics such as the health examination for athletic participation, physical readiness for football, hot weather hints, and a first-aid chart for athletic injuries.

For a copy of the handbook, write the AMA Order Department, 535 North Dearborn Street, Chicago, Ill. 61610. Single copies are 15 cents each.

* * *

Although the results of the Faculty's questionnaire are still being tabulated, the latest figures reveal that 1,160 questionnaires were returned—a little better than a 25% participation. Out of this total, 895 members indicated they read the *Maryland State Medical Journal,* 632 read *JAMA,* 937 read specialty journals (usually more than one), 610 read *Medical World News, Medical Times* is read by 364 members, 733 read *Medical Economics.* The low scorer on the poll is the *New England Journal of Medicine* which is read by only 287.

The tabulated results on the use of library facilities indicate that 97 members frequently use the facilities, 573 rarely utilize the facilities, and 457 never use them.

One thing to keep in mind about these results is that they are not necessarily a reflection of how the membership *feels* about a particular aspect of Faculty services. For example, if the library were more accessible to a greater percentage of the membership, both geographically and in hours open, the poll would have revealed a different picture.

A number of members indicated they use hospital libraries

—some of which in turn use our facilities in order to obtain the desired information and the physician member is never apprised of this situation.

The Faculty library is competently staffed and offers a number of services of which the membership may not be totally aware. Next time you want a bibliography, or some other information, call the library at 539-0872.

* * *

In a recent issue of FOCUS, the University of Maryland at Baltimore's bulletin, **John H. Moxley, III, MD,** Dean of the School of Medicine, was quoted as saying: "During the 70's medicine in general, and the University of Maryland in particular, will continue to focus on medicine's relationship to the quality of life. The organization and delivery of care will retain the center stage throughout the end of the 70's and on to the end of the century.

"Some pieces of the puzzle which will receive the focus of this medical school are: ambulatory care and its relationship to medical education; new networks of care involving affiliated hospitals; further increases in class size (probably to 200); physical expansion with completion of at least two new buildings (North Hospital and Howard Hall addition) and probably a third (a VA Hospital); continued curricular reform with increasing emphasis on individual curriculum for each student; and completion of the Community Mental Health and Retardation Center, which will represent a unique combination of community-university-state interests.

"The hallmark of medicine in the 70's will be change—hopefully occurring in a more manageable order than in the 60's."

The Director of the Hospital, **George H. Yeager, MD,** stated: "We may expect a number of trends observed in the 60's to continue and intensify during the 70's. These trends can be grouped in categories: 1) More patients with more severe illnesses will require more elaborate treatment facilities and specialized talents of physicians and supporting personnel. 2) Increasing numbers of nonemergency patients will seek care in our emergency facilities. We must plan facilities to handle the needs of these patients apart from emergency patients. 3) The hospital may be asked to provide preliminary and follow-up care to a defined geographic population. This, too, will require planning for facilities different from the traditional specialty clinics. 4) As the number of students increases, greater demands will be placed on the hospital for supportive facilities, including faculty offices and conference rooms.

"In addition, we must develop living quarters for house staff and nurses, and arrange for such needs as a local bank, post office, and restaurants."

* * *

The Maryland Association for Mental Health is again recruiting high school students for the Student Careers Program conducted in the state mental hospitals.

The purpose of the program, to be held from July 6 through August 21, is to encourage students to consider a career in the mental health field and to give them a more informed attitude toward mental illness. Students will work with mentally ill and retarded patients at Eastern Shore, Crownsville, Spring Grove, Springfield, Henryton, and Rosewood state hospitals as well as at the Sheppard and Enoch Pratt Hospital. Many of the students working at the state hospitals will live on the hospital grounds.

Under supervision at all times, the students will work as assistants in most treatment wards. The program will begin with an orientation at each hospital and will include lectures by the professional staff. Each student will receive a $175 stipend for the seven-week program.

The Johns Hopkins University School of Medicine has been awarded $389,754 by the John A. Hartford Foundation, Inc., of New York, to support mapping studies of human chromosomes.

Victor A. McKusick, MD, principal investigator for the project, stated, "It is our expectation that studies of this type will increase our understanding of hereditary diseases and improve our treatment for them."

Dr. McKusick is chief of the Division of Medical Genetics and director of the Moore Clinic at Hopkins.

* * *

Slight changes in blood cells may help physicians confirm kidney diseases early in the life of a child, reports a pediatrician from Georgetown University's School of Medicine.

Philip L. Calcagno, MD, professor and chairman of the Department of Pediatrics, said that a study of hereditary nephritis indicates that a particular combination of minute changes in the cells may be found frequently in early stages of the disease.

The changes noted were fetal-like glomeruli; a mild abnormal increase in the number of cells present; large numbers of tubules filled with red blood cells; foam cells in the gaps between fibers of the kidney, and identical findings in brothers and sisters of the patient. The researchers used unusual factors in the family history of the patients, clinical findings, functional data and studies of actual kidney specimens to reach their conclusions.

In one case, they were able to trace hereditary nephritis through four generations of the family.

The study by the Georgetown

Hospital researchers is believed to be one of the first reports on early symptoms noted in connection with the kidney disease.

* * *

Julius Loebl, MD, director of the Division of Maternal and Child Health Services of Anne Arundel County, during a panel discussion held in March of this year, said that adults are sticking their heads in the sand in failing to provide birth control information to teen-agers because withholding information will not prevent illegitimate births.

Stressing that he was speaking "unofficially", Dr. Loebl indicated that legislation is needed to change the law that physicians cannot treat minors without parental consent. He stated the "climate is not right" to initiate the change and urged the audience to spread the word and get the "climate right".

Dr. Loebl stated that 474 pregnant Anne Arundel County girls between 12 and 18 were reported to his department last year. The girls need help and counseling, he said, and the county Department of Education has been receptive to a proposal to establish a special school for the pregnant teen-ager.

The Executive Board of the American College of Obstetricians and Gynecologists has approved the following recommendations of the Committee on Obstetric-Gynecologic Practice:

—That Fellows of the College should be members of teams negotiating for the delivery of obstetric-gynecologic services, and that the AMA and state medical societies be advised of this.

—That insurance companies be urged to provide proportionately the same coverage for obstetric care as is provided for other medical and surgical procedures.

—That the College publicize the role of obstetrician-gynecologists in maternity care.

—That the AMA be asked to include obstetric-gynecologic representatives on present and proposed committees concerned with the delivery of health care.

—That problems of professional practice be discussed and seminars held on these subjects at national and district meetings.

The Johns Hopkins University has received a $975,000 grant from the Ford Foundation to partially support research and training in the Division of Population Dynamics. The grant will provide for staff, fellowships, and laboratory equipment for family-planning administration, demography and related social sciences, and the Laboratory of Reproductive Physiology.

The division is headed by Dr. Paul Harper, a principal architect of Pakistan's family-planning program. The reproductive physiology laboratory was established in 1966 under the direction of Dr. John Biggers, a distinguished developmental biologist.

Faculty research has centered on maturation of ova and sperm, fertilization, growth of fertilized ova before implantation, and the early stages of pregnancy.

* * *

"A Look at Sex Education in the School" is a new film available to medical societies and woman's auxiliaries. The 16 mm color film is a panel discussion of the AMA's resolution endorsing family life and sex education programs in the nation's schools.

Prints are available without charge, on loan, from the AMA Radio and TV Department, 535 North Dearborn Street, Chicago, Ill. 60610.

THE MONTH IN WASHINGTON

The House Ways and Means Committee approved legislation that would change the Medicare program to permit prepaid closed-panel group practice care and would set ceilings on physicians' fees under Medicare and Medicaid.

The committee did not consider national health insurance proposals for legislative action this year.

A proposal for inclusion of chiropractic under Medicare was rejected. However, a compromise provision would direct the Health, Education and Welfare Department to conduct a "very limited" study of chiropractic under Medicare, utilizing the experiences under Medicaid. Chiropractic now is a Medicaid service in 15 states, being authorized for federal funds to the extent that it is legal in the state. Representatives of chiropractors lobbied intensively with committee members for the same treatment under Medicare.

The committee also decided against inclusion of social security disabled beneficiaries under Medicare. Instead, the proposal was referred to the Health Insurance Benefits Advisory Council for further study.

The House was expected to approve the committee's bill, which included a 5% increase in cash social security benefits, without change. However, changes were expected in the Senate.

Provisions of the committee bill of major importance to physicians included:

● **Health Maintenance Organization Option:** Individuals eligible for both Part A and Part B Medicare coverage would be able to choose to have their care provided by a health maintenance organization (a prepaid group health or other capitation plan). The government would pay for such coverage on a capitation basis not to exceed 95% of the cost of Medicare benefits provided to beneficiaries in the area not covered under the health maintenance organization.) ● **Experiments and Projects in Prospective Reimbursement and Incentives for Economy:** The secretary of HEW would be required to develop experiments and demonstration projects designed to test various methods of making payment to providers of services on a prospective basis under Medicare, Medicaid and maternal and child health. In addition, the secretary would be authorized to conduct experiments with methods of payment or reimbursement designed to increase efficiency and economy, and with community-wide utilization review mechanisms. ● **Limitation on Recognition of Physician Fee Increases:** Charges determined to be reasonable under the present criteria in Medicare, Medicaid, and maternal and child health law would be limited by providing: (a) that for fiscal year 1971 medical charge levels, recognized as prevailing, may not be increased beyond the 75th percentile of actual charges in a locality during calendar year 1969; (b) that for fiscal year 1972 and thereafter the prevailing charge levels, recognized for a locality, may be increased, on the average, only to the extent justified by increases in the cost of production of medical services, levels of living and the earnings of other professional, managerial and technical personnel; and (c) that for medical supplies, equipment and services that, in the judgment of the secretary, generally do not vary significantly in quality from one supplier to another, charges allowed as reasonable may not exceed the lowest levels at which such supplies, equipment and services are widely available in a locality. ● **Payments for Services of Teaching Physicians:** Medicare and Medicaid would not pay for the services of teaching physicians unless other patients who have insurance or are able to pay are also charged for such services and the Medicare deductibles and coinsurance amounts are regularly collected. Medicare attached payment would be authorized for services to hospital patients by staff of certain medical schools that now furnish these services without charge to the hospital. ● **Termination of Payments to Providers Who Abuse the Medicare Program:** The secretary of HEW would be given authority to terminate or suspend payment for services rendered by a supplier of health and medical services found to be guilty of program abuses. Program review teams would be established to furnish the secretary professional advice in carrying out this authority. ● **Repeal of Medicaid Provision Requiring Expanded Programs:** The requirement in present law that States have comprehensive medicaid programs by 1977 would be repealed. ● **Prohibition of Reassignments:** Medicare and Medicaid payments to anyone other than a patient or his physician would be prohibited, unless the physician is required as a condition of his employment to turn over his fees to his employer or unless there is a contractual arrangement between the physician and the facility in which the services were provided under which the facility bills for all such services. ● **Utilization Review in Medicaid:** Require hospitals and skilled nursing homes participating in the Medicaid and maternal and child health programs to have the same utilization review committee with the same functions as in the Medicare program. ● **Role of State Health Agencies in Medicaid:** State health agencies would be required to perform certain functions under the Medicaid and maternal and child health programs relating to the quality of the health care furnished to recipients. ● **Physical Therapy Services Under Medicare:** Under Medicare's supplementary medical insurance program, beneficiaries would be covered for up to $100 per calendar year of physical therapy services furnished by a licensed physical therapist in his office or the patient's home under a physician's prescription. Hospitals and extended-care facilities could continue to provide covered physical therapy services to patients who have exhausted their days of hospital insurance coverage. ● **Chiropractors' Services:** HEW would conduct a study on covering chiropractors' fees (on a very limited basis) under Medicare, utilizing the experimental authority under the Medicaid program. A report on the study, including the experience of other programs paying for chiropractors' services would be submitted to the Congress within two years.

* * *

The American Medical Association expressed opposition to a proposed oral contraceptive package insert addressed to users.

The Food and Drug Adminis-

tration first proposed a package insert of about 700 words dealing with possible side effects and potential dangers of taking birth control pills. When this raised widespread opposition, the FDA drastically revised the original draft, cutting it down to about 100 words. Main objections to the first draft were that it was too long and detailed to be addressed to a patient and that it raised a serious question about the relationship between physician and patient.

After the FDA invited comments on the revised draft from interested parties, Ernest B. Howard, MD, executive vice president of the AMA, responded that the AMA opposes any oral contraceptive package insert. He said that, "in the best interests of the patient and the practice of quality medicine," there should be no package insert addressed to users.

". . . The requirement that information on the side effects of a prescription drug be supplied directly to the patient is a dangerous departure from present practice," he said in a letter to the Health, Education and Welfare Department, of which FDA is a part. "It intrudes upon the patient-physician relationship and compromises individual medical evaluation. The proposed statement would lead to confusion and alarm among many patients and could result in harm to some.

"For these reasons, the American Medical Association is opposed to a package insert directed to patients for any prescription drug.

"The oral contraceptive is a prescription drug. It is the responsibility of the physician to inform his patients of the potential hazards of drugs he prescribes. In counseling on family planning, the physician has a further responsibility. He should provide information that will enable the patient to make an intelligent decision regarding the use of oral and other contraceptive methods.

"The proposed statement, in its simplistic approach to a complex situation, would confuse the patient who has already been informed of possible side effects by her physician and who has received her physician's recommendation as to a desirable method of contraception for her. . . .

"A stated purpose of the insert is to reinforce the efforts of the physician to inform the patient in a balanced fashion of the risks. The physician has a duty to weigh the benefits against the possible risk in prescribing any drug for a patient, and the physician's advice to the patient in connection with the drug prescribed must be individualized for each patient. The balanced fashion theory cannot be a part of good therapeutic practice, which requires an individual judgment for each patient. Standardized information could harm some patients by limiting the value of the specific information given to them by physicians.

"A package insert is an inappropriate and ineffective means of providing a patient with information regarding any prescription drug. The best way to inform patients effectively is through the physician. The best way to reinforce the physician's efforts to inform the patient is to provide him with unbiased, authoritative and up-to-date information. Our Council on Drugs has used the *Journal of the American Medical Association* for this purpose. Further, in a forthcoming book titled *AMA Drug Evaluations*, we will supply the physician with comprehensive information on oral contraceptives, as well as on other drugs. We would be pleased to join with the Food and Drug Administration and other concerned medical and scientific organizations in the preparation of any additional information, and to provide a means of placing it in the hands of all physicians. . . ."

* * *

The American Medical Association supported two Senate bills (S. 3297 and S. 3652) that would require labeling of prescription drug containers except where the prescribing physician indicated otherwise.

"We would emphasize very strongly, however," John J. Curry, MD, a member of the AMA Council on Drugs, testified at a Senate Health Subcommittee hearing, ". . . that both bills fall short of the recommendation of the American Medical Association. In urging your support of labeling legislation, we strongly recommend that the legislative requirement provide that the label contain the established name or trade name of the drug as written by the physician, or, in the case of a combination drug, the established name of the active ingredients of the drug or its trade name as written by the physician, and the quantity and strength of the drug. Provision should, of course, be made that the label would not contain any or all of the foregoing information where the physician so indicates."

The AMA also supported S. 3096 and another provision of S. 3297 that would require a coding identification on each tablet, capsule or other final form of a medication.

The AMA did not take a position on a fourth bill (S. 3651) that would require inspection of drug manufacturing firms every six months, instead of the present two years. Dr. Curry said that he was concerned that medications he prescribed "are of maximum purity and manufactured under proper controls," but that he was not qualified to speak on the length of time between inspections.

PROTEIN CONTENT / 7 oz. Serving*

Bean with Bacon	6.8	Green Pea with Ham (Frozen)	7.6
Beef	8.0	Hot Dog Bean	8.4

You Can't Blame a Girl...

(when her husband's at fault)

Flagyl® brand of metronidazole

Cures Trichomoniasis in Both Women and Men

About half of all husbands of infected women harbor *Trichomonas vaginalis.**

Few of these men have symptoms. Even so, all are capable of perpetuating the infection and rendering treatment of a woman alone futile.

Only a systemically active medication like Flagyl is capable of reaching the hidden reservoirs of infection in the genitourinary tracts of both men and women.

Only Flagyl has been able to achieve rates of cure consistently above 90 per cent and often up to 100 per cent in trichomonal infections in both men and women.

Indications: For the treatment of trichomoniasis in both male and female patients and the sexual partners of patients with a recurrence of the infection provided trichomonads have been demonstrated by wet smear or culture.

Contraindications: Evidence of or a history of blood dyscrasia, active organic disease of the central nervous system and the first trimester of pregnancy.

Warnings: Use with discretion during the second and third trimesters of pregnancy and restrict to patients not cured by topical measures. Flagyl (metronidazole) is secreted in the breast milk of nursing mothers. It is not known whether this can be injurious to the newborn.

Precautions: Mild leukopenia has been reported during Flagyl use; total and differential leukocyte counts are recommended before and after treatment with the drug, especially if a second course is necessary. Avoid alcoholic beverages during Flagyl therapy because abdominal cramps, vomiting and flushing may occur. Discontinue Flagyl promptly if abnormal neurologic signs occur. There is no accepted proof that Flagyl is effective against other organisms and it should not be used in the treatment of other conditions. Exacerbation of moniliasis may occur.

Adverse Reactions: Nausea, headache, anorexia, vomiting, diarrhea, epigastric distress, abdominal cramping, constipation, a metallic, sharp and unpleasant taste, furry or sore tongue, glossitis and stomatitis possibly associated with a sudden overgrowth of *Monilia,* exacerbation of vaginal moniliasis, an occasional reversible moderate leukopenia, dizziness, vertigo, drowsiness, incoordination and ataxia, numbness or paresthesia of an extremity, fleeting joint pains, confusion, irritability, depression, insomnia, mild erythematous eruptions, "weakness," urticaria, flushing, dryness of the mouth, vagina or vulva, vaginal burning, pruritus, dysuria, cystitis, a sense of pelvic pressure, dyspareunia, fever, polyuria, incontinence, decrease of libido, nasal congestion, proctitis, pyuria and darkened urine have occurred in patients receiving the drug. Patients receiving Flagyl may experience abdominal distress, nausea, vomiting or headache if alcoholic beverages are consumed. The taste of alcoholic beverages may also be modified.

Dosage and Administration: *In the Female.* One 250-mg. tablet orally three times daily for ten days. Courses may be repeated if required in especially stubborn cases; in such patients an interval of four to six weeks between courses and total and differential leukocyte counts before, during and after treatment are recommended. Vaginal inserts of 500 mg. are available for use, particularly in stubborn cases. *When the vaginal inserts are used* one 500-mg. insert is placed high in the vaginal vault each day for ten days and the oral dosage is reduced to two 250-mg. tablets daily during the ten-day course of treatment. Do not use the vaginal inserts as the sole form of therapy. *In the Male.* Prescribe Flagyl only when trichomonads are demonstrated in the urogenital tract, one 250-mg. tablet two times daily for ten days. Flagyl should be taken by both partners over the same ten-day period when it is prescribed for the male in conjunction with the treatment of his female partner.

Dosage Forms: Oral tablets . . . 250 mg.
Vaginal inserts . . 500 mg.

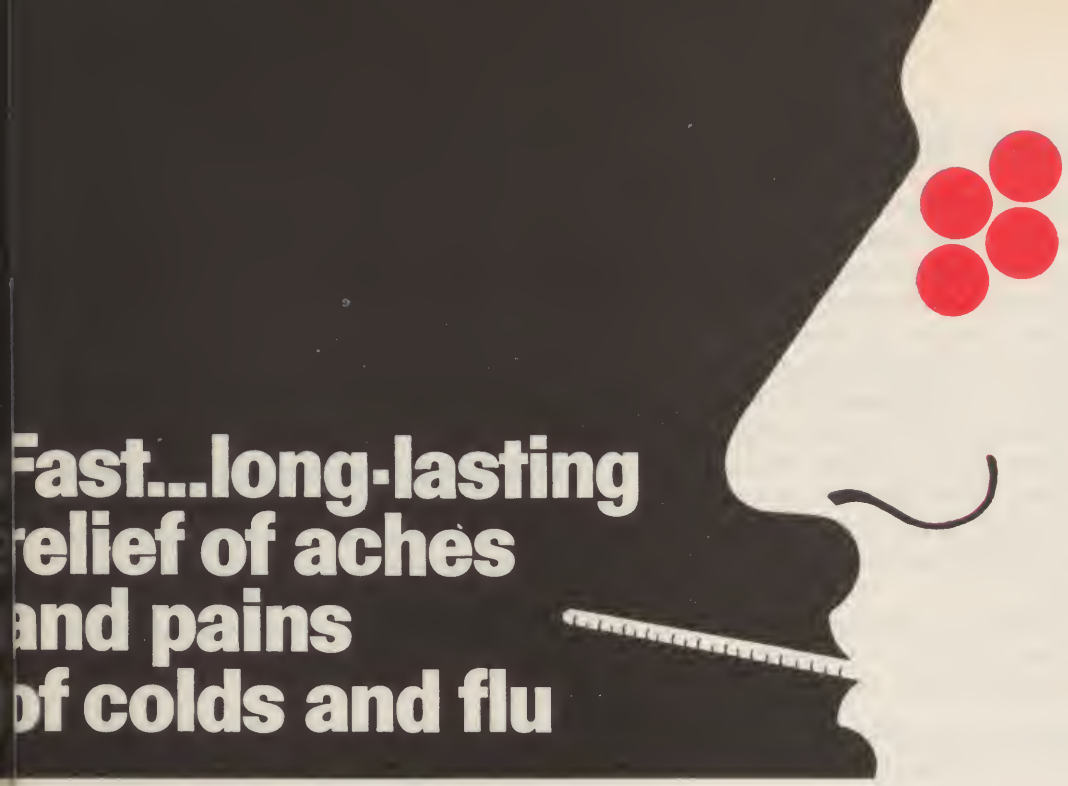
Owner Breaks Arm When Yacht Runs Agroun

Schuyler, Oct. 31. Harry Waters of Covesville incurred a fractured arm tially capsized. The fire depar had to rescue Waters by smal Damage to the yacht is estima

Hasn't the skipper had enough excitement for one day?

For the patient who has been through an accident, the worry and anxiety following the mishap may actually heighten the perception of pain. This is why there's a classic ¼ grain *sedative* dose of phenobarbital in Phenaphen with Codeine—to take the nervous "edge" off, so the rest of the formula can control the pain more effectively.

A.H. Robins Company, Richmond, Va. 23220 A·H·ROBINS



Phenaphen® with Codeine

Phenaphen with Codeine Nos. 2, 3, or 4 contains: Phenobarbital (¼ gr.), 16.2 mg. (warning: may be habit forming); Aspirin (2½ gr.), 162.0 mg.; Phenacetin (3 gr.), 194.0 mg.; Hyoscyamine sulfate, 0.031 mg.; Codeine Phosphate, ¼ gr. (No. 2), ½ gr. (No. 3), or 1 gr. (No. 4) (warning: may be habit forming).

The compound analgesic that calms instead of caffeinates

Indications: Phenaphen with Codeine provides relief in severer grades of pain, on low codeine dosage, with minimal possibility of side effects. Its use frequently makes unnecessary the use of addicting narcotics. **Contraindications:** Hypersensitivity to any of the components. **Precautions:** As with all phenacetin-containing products excessive or prolonged use should be avoided. **Side effects:** Side effects are uncommon, although nausea, constipation and drowsiness may occur. **Dosage:** Phenaphen No. 2 and No. 3—1 or 2 capsules every 3 to 4 hours as needed; Phenaphen No. 4—1 capsule every 3 to 4 hours as needed. For further details see product literature.

Fast...long-lasting relief of aches and pains of colds and flu

with the unique timed-release aspirin

Double strength Measurin timed-release aspirin offers a new kind of control for your patients with cold and flu discomforts. In each 10-grain tablet are over 1,000 microscopic reservoirs that release aspirin at a controlled rate—some right away and some later on. This means fast relief of symptoms, followed by hours of comfort. Throughout the day, Measurin gives your patients freedom from a 4-hour aspirin schedule. During the night, its 8-hour dosage schedule holds the promise of sound sleep without awakening to take extra tablets.

ECONOMICAL • EFFECTIVE • LONG LASTING PAIN RELIEF
Dosage: 2 tablets followed by 1 or 2 tablets every 8 hours as required, not to exceed 6 tablets in 24 hours. For maximum nighttime pain relief, 2 tablets at bedtime.
Available: Bottles of 12, 36 and 60 tablets.

Information for Authors

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published, and are contributed solely to the Maryland State Medical Journal.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the Journal and are not returned. The Journal is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to: Editor, Maryland State Medical Journal, 1211 Cathedral St., Baltimore, Md. 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (Including text, case reports, legends, tables and references) with margins of at least 1½ inches. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations, and any institutional or other credits. Please include a complete address where the author may receive proofs of his article for his approval and corrections.

All manuscripts should be accompanied by a carbon or Xerox copy and the author should retain another copy for his records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title, and its position in the text should be indicated.

Be sure that statistics are consistent in both tables and text.

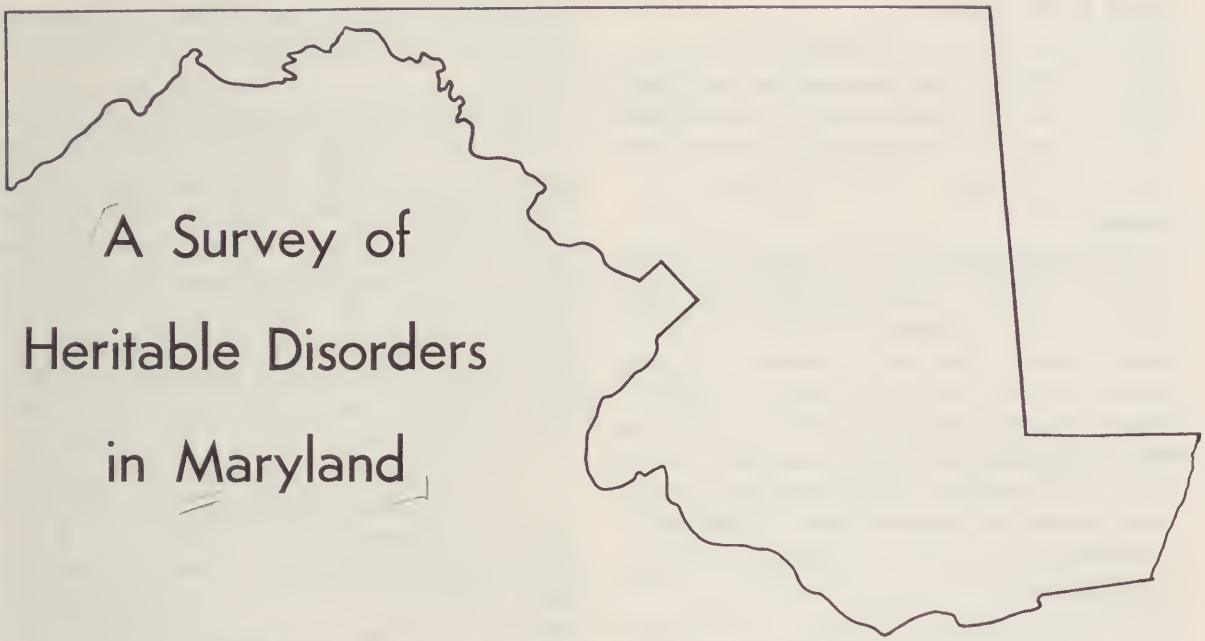
REFERENCES: References should be limited to those citations noted in the text, and kept to a minimum of 18. (A complete review of the literature is rarely desirable.) The references must be typed, doublespaced, and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and/or editor(s) with initials, title of book, edition, location, publisher, year, volume (if given), and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book), and the title of the chapter, if any.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Magnifications will be modified in proportion to the amount of reduction necessary to fit the pages of the Journal. Please do not deface an illustration by writing on the front or the back, nor should it be taped or pasted to paper. The illustration may be pasted onto a piece of cardboard. Attached to the back of each illustration, chart or photograph should be the figure number, the author's name and the title of the article.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings.



Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with Journal style.

Statements made or opinions expressed by any contributor in any article or feature published in the Journal are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the Maryland State Medical Journal is protected by copyright and may not be reproduced without the written permission of both the author and the Journal.

A Survey of Heritable Disorders in Maryland

Chronic diseases are recognized as a major challenge in the United States today. A rapid increase in research discoveries and an awareness of the value of genetic counseling have heightened interest in medical genetics. As a result of this trend, at least 15 state health departments have started programs in genetics.[1] The present study was undertaken in collaboration with the Maryland State Department of Health as a preliminary step in expanding health services in genetics. It is concerned primarily with disorders inherited in a Mendelian manner or with chromosomal aberrations. Some data are available for the incidence of congenital malformations[2,3,4,5,6] and for the more common conditions with genetic components,[2,7,8] but there are few statistics for the prevalence of rare disorders which follow simple Mendelian inheritance.[9] The proportion of congenital malformations so far described which "mendelize" is also unknown.

Object of the Survey

The purpose of the investigation has been to assess the minimal dimension of the health problem due to genetic disorders and to explore facilities in the state for investigation, treatment, counseling, and follow-up of affected persons.

Method

Selection techniques for rare traits were recently reviewed by Kish.[10] Methods used in this survey resemble those designated by Kish as most effective, namely, the use of special lists which contain one rare class, supplemental samples to locate the units which are missing from the lists, and the separation of special strata which contain most of a rare class. The following resources were screened for selected genetic disorders:

1. Rosewood and Henryton State Hospitals, institutions for the mentally deficient
2. Children's Hospital, dealing particularly with musculoskeletal abnormalities
3. Specialty clinics in Baltimore hospitals: muscular dystrophy, cystic fibrosis, diagnostic and evaluation and birth defects clinics
4. Cytogenetic laboratories
5. The Maryland State Department of Health: phenylketonuria registry, diagnostic and advisory team, the 23 county health departments and Baltimore City Health Department
6. The Bureau of Vocational Rehabilitation registry of the blind
7. Maryland School for the Deaf
8. Baltimore League for Crippled Children and Adults

Data on selected heritable disorders were collected from August through November, 1967. Name, birth date, race, and sex of patients were recorded when official policy permitted. Nonspecific diagnostic categories or lack of diagnostic indexing and computerized data and retrieval systems imposed limitations to the collection. Diagnoses from cooperating facilities which had usable record systems were converted to the coding of the INTERNATIONAL CLASSIFICATION OF DISEASES, ADAPTED (I C D A [11]) and MENDELIAN INHERITANCE IN MAN (M I N [12]). Approximately 6,000 hospital, clinic, laboratory, and agency records were examined.

In addition, several agencies provided counts or estimates of the prevalence of specified conditions although the individual records were not made available to the investigator. A description of the data available from each of the facilities follows.

Rosewood and Henryton Hospitals are the two institutions designated by the state for custodial care of the mentally retarded. Rosewood had 2,852 patients of whom almost three quarters were in the age group 5 to 24 years. Henryton had 405 patients 18 years of age and over. The records of these two facilities were searched for patients with genetic disorders who were in resident, foster, or convalescent care in 1967. Identifying information was available for cross-checking with lists from other facilities.

Children's Hospital data are based on 24,999 orthopedic admissions between 1955 and 1967, indexed by diagnosis. The names of the individuals were not available so there may be multiple ascertainment of some persons. This will result in overcounts of some conditions, as estimated from this facility.

Among the specialty clinics, the Diagnostic and Evaluation (D and E) Clinic at The Johns Hopkins Hospital and at the University of Maryland are referral clinics for children with multiple handicaps. A major portion of the children are mentally retarded. The Diagnostic and Advisory (D and A) team of the State Health Department is involved with problems similar to those of the hospital D and E clinics. The team travels to eight Maryland counties reviewing diagnostic problems for referral to medical centers. The records were extracted from these clinics and the names of those with genetic conditions were checked with those of other facilities.

It is estimated that about 75% of Maryland patients with muscular dystrophy and cystic fibrosis attend the two specialty clinics for these diseases at The Johns Hopkins Hospital. Between 1960 and 1967, 150 muscular dystrophy cases were in follow-up at the muscle clinic. The cystic fibrosis clinic had 128 patients registered between 1959-1967 of whom 60% were in follow-up at the date of the study. These counts were obtained from unpublished reports from the clinics.

Patients needing treatment for congenital defects are eligible to attend the National Foundation-March of Dimes birth defects treatment center at The Johns Hopkins Hospital. The names of these persons were extracted, and also checked against those of other facilities. The State Department of Health phenylketonuria registry reported 79 resident cases of phenylketonuria.

A review of the work of the cytogenetics laboratories in the state revealed that much of the work is research rather than service-oriented and therefore not suitable for obtaining estimates of frequency of genetic disorders.

County public health officers and nurses were asked to fill out the form presented in Figure 1. These forms provided estimates of the number of persons known to be affected with the specified heritable disorders. The Baltimore City Health Department provided counts of the number of cases according to the selected diagnoses from their Handicapped Children's Program in 1966 and 1967.

Figure 1: THE MOORE CLINIC
THE JOHNS HOPKINS HOSPITAL
Baltimore, Maryland 21205

Have you observed any of these hereditary disorders in .....County?	No. of Cases
1. Albinism	
2. Anemia of hereditary type	
3. Blindness, congenital or early in onset, partial or complete	
4. Cataract, congenital or juvenile	
5. "Cerebral palsy"	
6. Cretinism	
7. Cystic fibrosis of the pancreas	
8. Deaf-mutism	
9. Dwarfism, any type	
10. Goiter with childhood onset	
11. Hand malformations	
12. Heart malformation, any type	
13. Hemophilia and other bleeding disorders	
14. Hydrocephalus	
15. Jaundice with or without hemolytic anemia	
16. Mental retardation, any type	
17. Mongolism	
18. Muscular dystrophy, any type	
19. Nephritis	
20. Neurologic disorders, such as Friedreich's ataxia	
21. Phenylketonuria	
22. Polydactyly	
23. Retinitis pigmentosa	
24. Sex disorders	
25. Skin ailments, congenital, any type	
TOTAL	

Have you observed other types of hereditary disorders? Any disorder which seems to "run in the family" will be of interest to us.

The Bureau of Vocational Rehabilitation reported a current register of 1,483 blind persons. Registration of the blind by the Bureau of Vocational Rehabilitation was established as a Federal project in September 1966 and is maintained up-to-date. Cases are ascertained throughout the State from hospital records, ophthalmologists, optometrists, the Maryland School for the Blind, and the Workshop for the Blind.

The Maryland School for the Deaf provided statistics on the number of children enrolled in the school in September 1967 who had a family history of deafness or diagnosis of a condition known to be genetic.

The registry of the Baltimore League for Crippled Children and Adults was reviewed for genetic conditions and screened for duplication of names on the other study lists. Most of the registrants were adults.

Results

Table I gives the results of review of 6,182 records from seven facilities. Heritable conditions are grouped according to the genetics of the abnormalities: established Mendelian disorders, possible Mendelian disorders, mongolism, and other chromosomal aberrations. The genetics are not clear for unclassified congenital malformations, unclassified congenital deafness, microcephaly without other malformations and familial mental retardation.

Tables II-A, B, and C present frequency distributions for established Mendelian disorders by mode of inheritance. The data are from Children's Hospital and the seven selected health facilities of Table I. Children's Hospital data are examined separately because of the chance of multiple listing of an affected person when identifying information is used as diagnosis alone.

There were 27 autosomal dominant conditions reported in 81 persons of which tuberous sclerosis with 24 cases and neurofibromatosis with 13 cases were the most common. A total of 28 autosomal recessive conditions were reported in 102 persons of whom 48 had phenylketonuria. Among the seven X-linked conditions reported in 12 persons, six were muscular dystrophy (Duchenne type).

In addition, 12 autosomal dominant conditions in 75 diagnoses, 12 autosomal recessive in 50, and three X-linked conditions in 23 were reported from the Children's Hospital. These are somewhat different conditions than those reported by the other facilities as might be expected from the nature of the facilities. The most prevalent diagnoses of dominant conditions were Charcot-Marie-Tooth disease with 20 diagnoses and osteogenesis imperfecta with 17. Among the recessive conditions, limb girdle muscular dystrophy was the most common, occurring 14 times. Of the 23 diagnoses of X-linked conditions, 18 were hemophilia A or B.

TABLE IV

Baltimore City Health Department

Number of children newly registered in the Handicapped Children's Program (HCP) according to primary diagnosis of genetic condition, July 1, 1965-June 30, 1967.

Diagnostic Code, HCP	Primary diagnosis of genetic condition	No. of Cases
019	Other endocrine diseases	24
020	Other metabolic and nutritional disease	07
021	Sickle cell anemia	22
022	Hemophilia	01
023	Other disease of blood and blood-forming organs	11
024	Mongolism	30
033	Other disease of nervous system	44
056	Cystic fibrosis	10
062	Disease of skin and cellular tissue	21
069	Certain disease of bones and joints	06
071	Progressive muscular dystrophy	04
079	Other disease of musculo-skeletal system	60
082	Congenital cataract	10
083	Congenital ptosis of eyelid	07
101	Chondrodystrophy	02
102	Osteogenesis imperfecta	102
104	Other congenital malformations of bone and joint	20
105	Webbed fingers and/or toes	04
106	Other congenital malformations	93
	TOTAL	478

Table III summarizes the County Health Departments' estimates of prevalence of genetic disease. Sixteen out of 23 counties, exclusive of Baltimore city, reported 4,464 cases. Baltimore City Health Department data were primary diagnoses of newly registered children from the Handicapped Children's Program July 1965 through June 1967 (Table IV). Almost 11% of these 3,475 newly registered children had diagnoses attributable to genetic etiology. Comparable figures for all children in the program were not available.

Table V shows the number of cases of blindness of probable or possible hereditary origin listed on the Vocational Rehabilitation's Registry of the Blind by diagnosis and by whether the condition was one in which other cases were reported in blood relatives. For 37 cases familial occurrences were reported. There was no other case in the family in 31 cases and for 224 of the cases it was not known whether familial cases were present or not.

TABLE V

Number of Cases by Diagnosis On the Vocational Rehabilitation's Registry of the Blind, 1967

Abnormality	Family History		
	Positive for other cases	Negative for other cases	Unknown
Achromatasia (Congenital Cone defect)	0	0	2
Albinism	3	0	17
Cataracts, congenital	2	0	20
Cataracts, congenital with nystagmus	0	0	12
Glaucoma, infantile: with cataracts	0	0	3
without cataracts	0	0	20
Macular degeneration	3	0	8
Microphthalmos	0	0	3
Myopia, high: with degeneration	2	0	0
without degeneration	0	0	3
Nystagmus, congenital	2	0	10
Ocular anomalies, multiple congenital	0	13	10
Optic atrophy	3	7	10
Retinitis pigmentosa: typical	10	0	55
atypical	3	0	0
All other conditions	9	11	51
TOTAL NUMBER OF CASES	37	31	224

Table VI and Figure 2 show the classification of 102 children with known hereditary deafness and probable hereditary deafness reported from a total enrollment of 295 deaf children in 260 families from age 5 in kindergarten to age 17 to 19 years in the 12th grade.

TABLE VI

Classification of children with known hereditary deafness and probable hereditary deafness, enrolled in the Maryland School for the Deaf, 1967.

Heredity	Number of Children	Number of Families
Known genetic syndrome (Waardenburg's syndrome Laurence-Moon-Biedl, etc.)	9	9
More than 1 generation of affected individuals	62	38
Parents normal, but affected sibs	31	21
TOTAL	102	68

Table VII presents counts of cases of three conditions, phenylketonuria, cystic fibrosis and muscular dystrophy, reported by the State Health Department and The Johns Hopkins Hospital specialty clinics for cystic fibrosis and muscular dystrophy, respectively. These represent frequency of diagnosis over the periods of time specified in the table.

Figure 2. Pedigree of familial deafness among pupils at the Maryland School for the Deaf.

TABLE VII

Number of cases of phenylketonuria (PKU), muscular dystrophy and cystic fibrosis of the pancreas from special files.

	Number of cases	Period of time covered
PKU Registry, MSDH	79	1967
Cystic fibrosis clinic J.H.H.	128	1959-1967
Muscular dystrophy clinic J.H.H.	150	1960-1967

Discussion

The data presented represent the total number of reports of persons with heritable disorders or, for Children's Hospital, the total number of diagnoses when the known duplications have been removed. For some of the reporting agencies the numbers clearly are measures of prevalence, ie, the number of cases existing at the time of the study. The data from the two State mental institutions, the Bureau of Vocational Rehabilitation (B.V.R.), the Maryland School for the Deaf, and the Baltimore League for Crippled Children and Adults are of this type. However, the prevalence in mental institutions must be supplemented by counts from the noninstitutionalized population if estimates for the entire state are to be obtained.

The registry of the blind maintained by the B.V.R. may be assumed to contain a reasonably accurate list, at least of the genetically determined types of blindness, except that the registry may not have been in operation long enough to have completed the ascertainment of all cases in the community.

The Maryland School for the Deaf records are limited (1) to school-age children, and (2) to children attending this school. Deaf children who may be in other schools or institutions have not been counted.

Reports from the remainder of the facilities (except for Children's Hospital) constitute incidence, ie, number of diagnosed new cases occurring during a period of time. The period of time varies from one to nine years. The age span covered by these facilities is childhood for the D and E, and D and A clinics, and all ages for the others. Furthermore, Children's Hospital data give incidence of diagnoses rather than incidence of prevalence of persons with the conditions. The age span covered is childhood.

Also, the City Health Department's counts represent incidence of the reported conditions. They are counts of children newly registered in the Handicapped Children's program and do not include all children in the program. Furthermore, the children in the program represent an unknown proportion of all children with the conditions. On the other hand, the reports from the counties are probably prevalence plus some previously known cases who are now dead or are no longer in the area. These are deficient because (1) only 16 of the 23 counties are represented, and (2) they represent only cases known to the health departments.

It is obvious that some persons may have been counted in both incidence and prevalence figures, for example, at a diagnostic clinic and at a mental hospital, but these cannot be sorted out without the name and identifying information for each individual, which were not available. There are some conditions for which this duplication may be great, such as mental retardation, ataxia, and chromosomal abnormalities, and some, such as muscular dystrophy, for which it may be minor.

The data do provide minimum estimates of incidence and of prevalence, although even without duplication it would be difficult to put such figures together into a single measure of the frequency of such conditions. The variability in diagnosis, in ascertainment probability, in availability of facilites, in eligibility for use, and in willingness to use the facilities in addition to the measurement problems discussed above all make it impossible to pool the counts into summary figures. It is more useful, perhaps, to consider the data as providing measures of the demand on these facilities by persons with genetic conditions.

Recommendations

It is recommended that the State Department of Health through its local subdivisions take fuller advantage of available services in medical genetics at the University Hospital, Sinai Hospital and The Johns Hopkins Hospital by direct referral of persons with genetic disease. In addition, a state registry of reportable genetic disorders is advocated as an adjunct to epidemiological methodology for study of control and prevention of heritable disorders.

Summary

The results of the survey provide minimal prevalence and incidence information on heritable disorders in Maryland. The University Hospital, Sinai Hospital and The Johns Hopkins Hospital have facilities for the study of genetic disease with diagnosis, management, genetic counseling and long-term follow-up of patients and families. A fuller utilization of these university and hospital centered medical genetic clinics by local Health Departments is urged and a registry of reportable genetic diseases is recommended as a method for compiling epidemiologic data applicable to the long-range goal of control and prevention of heritable disorders.

The Number of Children and the Supply of Physicians in Maryland Since 1940

In an earlier review (January 1968 pp 66-69) we found that one half of the general practitioners in the State of Maryland were 57 years of age or over. Pediatricians comprised only 19% of the physicians in the state giving primary care to children. The number of pediatricians entering practice in large metropolitan areas in the most recent cohort fell below previous age cohorts. From this kind of information we concluded that present educational facilities and present patterns of recruitment or of practice would not satisfy the increasing demand for physicians to provide medical care for children in private offices.[1]

The Committee on Medical Care of the Maryland State Planning Commission had at that time received reports of shortages of physicians which are understood to be problems in distribution. To study patterns of distribution we reviewed population changes for each county in Maryland and compared them with the number of pediatricians and general practitioners in the same counties.

OSCAR C. STINE, MD, DrPH
Associate Professor of Pediatrics
University of Maryland School of Medicine

ACKNOWLEDGEMENT

Mrs. Rose Powdermaker carried out the counting of physicians by their community of practice and their specialty. Many of these physicians were known to her as students at the University of Maryland, where she has been a secretary since 1945.

Population Growth in Maryland

Inspection of the United States census data for the counties of Maryland reveal that population growth has been unevenly distributed among the counties. Eight counties in Maryland more than doubled their population of children in the 20 years between 1940 and 1960.[2] They were, in order of size of increase: Charles, Howard, St. Mary's, Harford, Anne Arundel, Baltimore, Prince George's, and Montgomery counties. The latter quadrupled its child population. Figure I shows how these counties are grouped around Baltimore, Annapolis and Washington, D.C. Since their rate of population increase is greater than the national average we may assume that much of their growth is due to immigration of persons rather than simply due to birth of children. They are counties in transition from agricultural to industrial and suburban economic patterns. They participate in the creation of the "megalopolis" of the middle eastern United States.

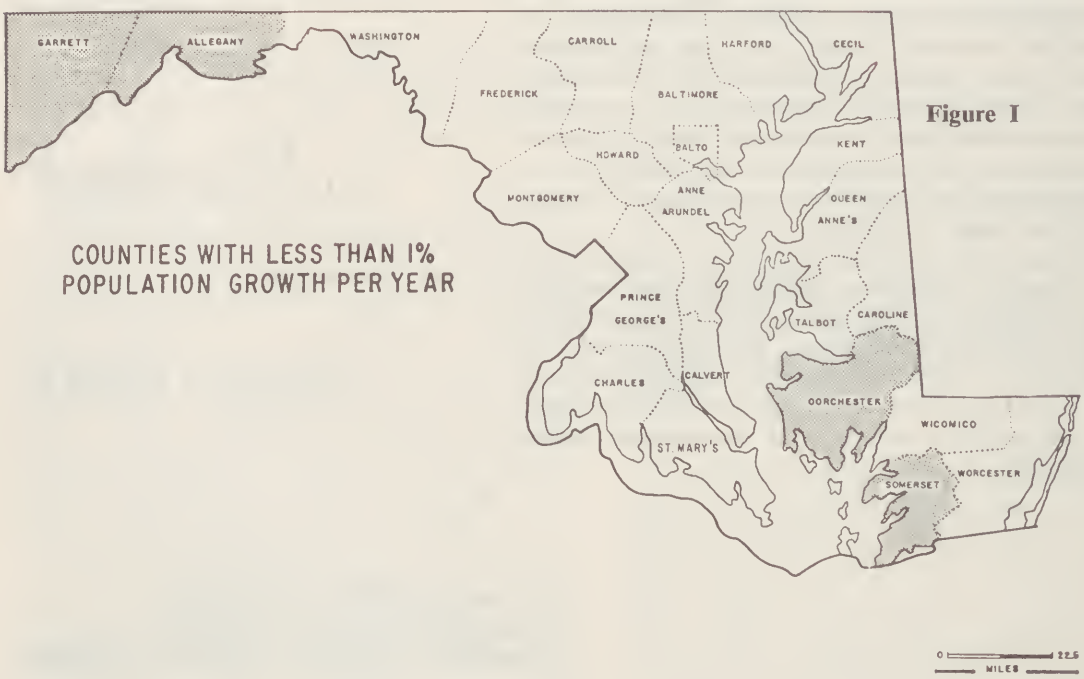

Figure I

In Figure II we can look at the counties in which the population of children less than 18 years of age increased at less than 1% per year over the past 20 years. They are the two mountainous western counties and two rural counties along the Chesapeake Bay. The population actually decreased in Garrett and Somerset counties. This suggests that Maryland's population pattern in this period of time has been one of movement of families from rural areas into industrial, urban, and suburban communities.

The Number of Physicians for Primary Care of Children

Primary medical care may be defined as the initial source of care for a majority of health and medical problems. Secondary medical care usually refers to care given by medical specialists upon referral from a source of primary medical care. General practitioners and pediatricians are the usual providers of primary medical care for children. In the past two decades pediatricians have provided primary medical care for about 20% of the children in the nation.[3] A number of trends are related to the reduced availability of general practitioners for the remainder of the children.[1,4] Outpatient Departments, Emergency Rooms, and Well Baby Clinics have assumed an increasing proportion of the primary care functions for children. Alternatives available to the community in the absence of general practitioners as a source of primary care include: 1) increased availability of pediatricians, 2) increased use of specialty services by families with

children without referral, 3) increased use of Outpatient Departments and Emergency Rooms for general pediatric care, or 4) new forms of primary medical care for children.

To calculate ratios between the number of physicians and the number of children we enumerated physicians by location, specialty, and birth date in the GEOGRAPHIC REGISTER of the American Medical Association for the appropriate years.[5] The numbers of children under 18 years of age for each county were obtained from CHARACTERISTICS OF THE POPULATION by the U.S. Census for the appropriate year.[2]

The decreasing availability of general practitioners to children in Maryland can be seen in Table 1. In 1940 there was a ratio of one general practitioner to every 430 children in Maryland. In 1960 the ratio was one general practitioner to every 1,490 children.

TABLE 1

RATIO OF GENERAL PRACTITIONERS TO CHILDREN IN MARYLAND

Year of Census	Ratio
1940	1:430
1950	1:474
1960	1:1490

The availability of pediatricians to children in Maryland increased 12% from 1:7000 in 1940 to 1:6170 in 1960 as can be seen in Table 2. During the same period of time the ratio of all physicians in Maryland to children decreased as may be seen in Table 3. The ratio of 1 physician to 177 children changed to a ratio of 1 physician to 259 children. We should remind ourselves that the numerator for physicians in all forms of practice includes an increased proportion of physicians, interns, residents, medical school teachers, and administrative physicians.[6]

TABLE 2

RATIO OF PEDIATRICIANS TO CHILDREN IN MARYLAND

Year of Census	Ratio
1940	1:7000
1950	1:6950
1960	1:6170

TABLE 3

RATIO OF PHYSICIANS (All Forms of Practice) TO CHILDREN IN MARYLAND

Year of Census	Ratio
1940	1:177
1950	1:207
1960	1:259

Geographic Location of Physicians in Maryland

The population shift from rural and small communities to urban and suburban communities is

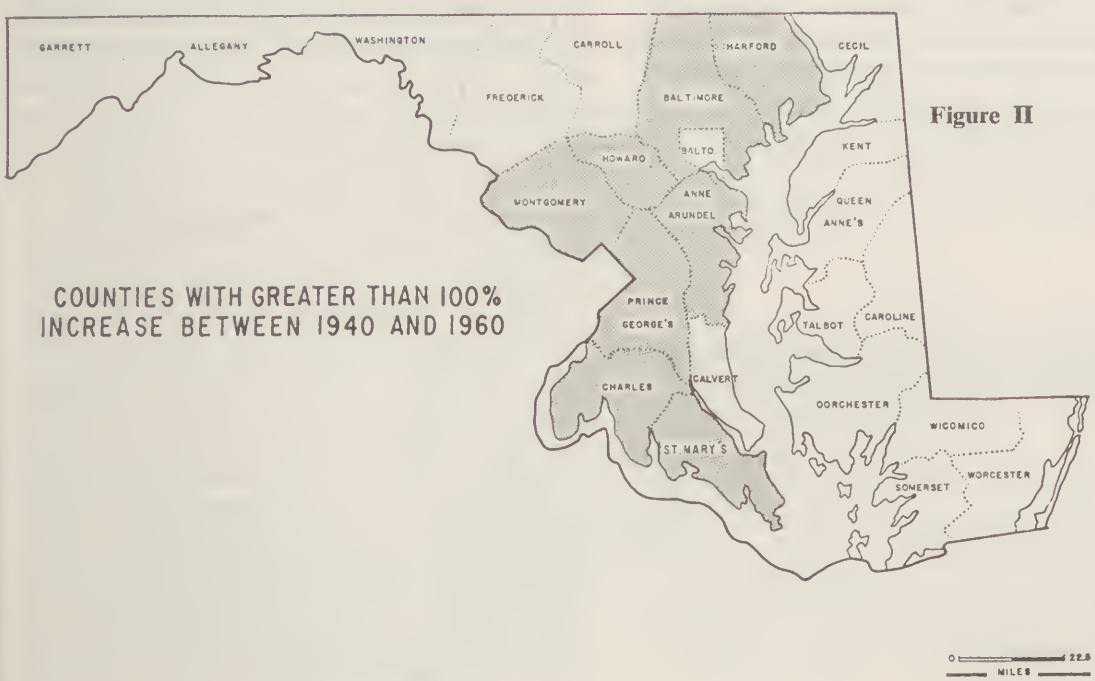

Figure II

not necessarily paralleled by changes in the number of primary-care physicians in the same communities. Table 4 shows the 30% decrease in primary-care physicians in communities under 1,000 in population which parallels the rural to urban shift, but the largest decrease in number of primary-care physicians is in the large city. Communities with populations between 5,000 and 10,000 are the only class of communities that has had an increased number of primary-care physicians and that increase is negligible. This is supported by an earlier study of the location of young physicians in which the State of Maryland was found to have an unexpected number of young physicians starting practice in the smaller cities rather than in the suburbs and cities.[1]

TABLE 4

PRIMARY-CARE PHYSICIANS
ACCORDING TO SIZE OF COMMUNITY
IN MARYLAND 1950-1960

Community Size	1950	1960	Difference	Per Cent Change
0 - 999	202	142	– 60	– 30%
1,000 - 2,499	106	103	– 3	– 2.8%
2,500 - 4,599	74	55	– 19	– 25%
5,000 - 9,999	40	44	+ 4	+10%
10,000 - 24,999	48	44	– 4	– 8.3%
25,000 - >	171	163	– 8	– 4.7%
Baltimore city	976	397	– 579	– 59%

The Anticipated Effect of Retirement Upon the Availability of Physicians to Children

Table 5 shows that between 12% and 17% of the physicians in communities under 5,000 population are over 65. This gives a fairly consistent picture with previous studies in which the average age of general practitioners is higher than other specialists; general practitioners are more likely to be located in smaller communities and young physicians are unlikely to seek practice situations in communities under 5,000 in population.

TABLE 5

PER CENT OF PHYSICIANS
OVER 65 YEARS OF AGE
BY SIZE OF COMMUNITY

Community Size	Per Cent of Physicians Over 65 Years of Age
0 - 999	15%
1,000 - 2,499	12%
2,500 - 4,599	17%
5,000 - 9,999	7%
10,000 - 24,999	4%
25,000 - >	8%

Changes in the Ratios of Primary-Care Physicians to Children by Geographic Area

Figure III shows that in 1940, counties with the largest number of children per primary-care physicians were the rural counties of Carroll, Calvert, Charles, Garrett and St. Mary's. Figure IV shows that in 1960 the counties with the greatest number of children per primary-care physicians were: Baltimore County (surrounding Baltimore city), Prince George's County (the fast-growing suburban area east of the District of Columbia), Howard County (between the two cities), Anne Arundel, Calvert, Charles, and Queen Anne counties. Population increases in the suburban counties have not been accompanied by comparable increases of primary-care physicians.

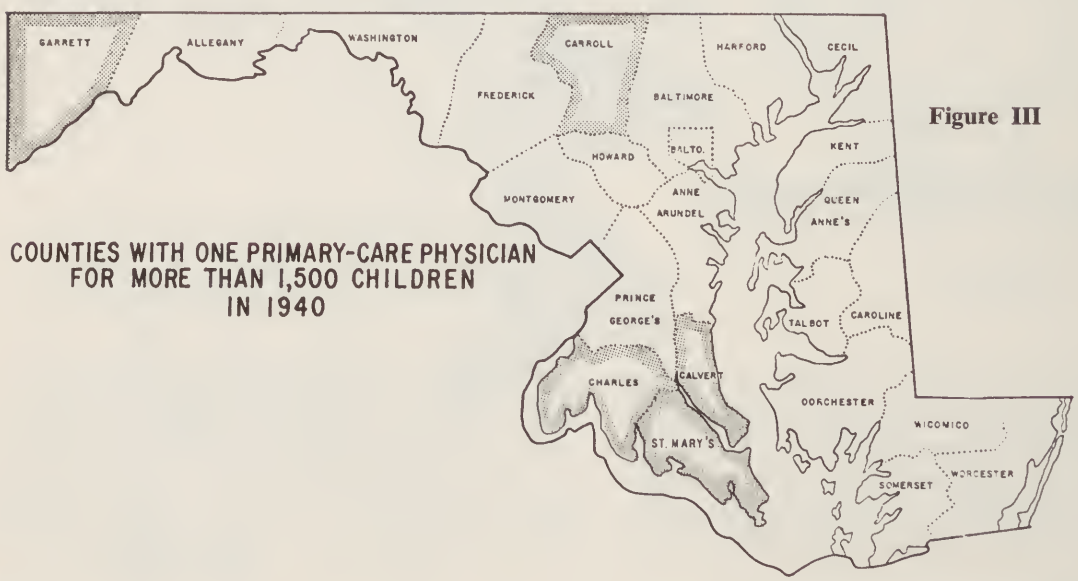

Figure III

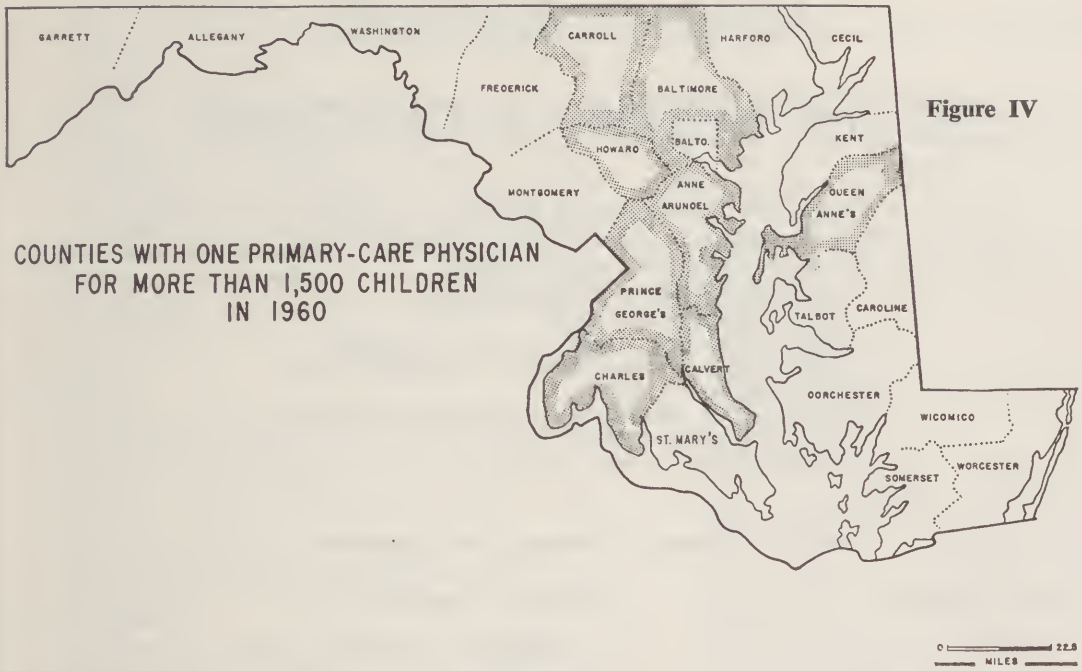

Figure IV

Discussion and Conclusions

To study problems in distribution of pediatricians and general practitioners in relation to the population of children we compared census information from 1940, 1950, and 1960 with the geographic registration of physicians by specialties in 1940, 1950, and 1967. County populations more than doubled between 1940 and 1960 for those counties surrounding Baltimore and the District of Columbia. Eastern Shore counties and the western mountain counties grew at lesser rates and even decreased in two of the counties. The number of general practitioners decreased markedly in number in small communities under 5,000 in population and in the City of Baltimore. The net effects of the rapidly growing population in the suburban counties, the lack of change in rural counties, and the combined numbers of pediatricians and general practitioners is described by ratios of primary-care physicians to children, which show that the suburban populations now experience the same physician to child ratio that some rural counties experienced in 1940. A 12% improvement in the ratio of pediatricians to children was more than offset by the decline of 1 general practitioner for every 430 children to 1 general practitioner for every 1,490 children. This calls attention to the distinct possibility that the rapidly growing suburban counties already have insufficient primary-care physicians for children due to rapidly decreasing numbers of general practitioners and the relatively constant output of pediatricians. Prince George's County, Anne Arundel County, and Baltimore County seem to be particularly susceptible to these trends.

Planning by physicians in these counties is urgent if we desire to have preferred forms of health services for children rather than having undesired alternatives forced upon us. Re-evaluation of these ratios with 1970 census data will be particularly important to determine whether or not these trends have continued. The ratio of 1 primary-care physician to 1,500 children may be an indicator of where we should study the satisfaction or dissatisfaction of families with the present availability of care for their children. To deal with these trends we should also study how primary-care-physician time may be used most efficiently in suburban areas.

COUNCIL AND EXECUTIVE COMMITTEE

Mr. President and Members of the House of Delegates:

The Council and Executive Committee held regular sessions during the past year including one immediately preceding and one immediately following the House of Delegates sessions at the 1970 Annual Meeting.

Summaries of all Council and Executive Committee sessions are published in the *Maryland State Medical Journal* each month in order to apprise the membership of our activities.

In addition to making recommendations for Emeritus Membership at the Annual and Semiannual sessions and referring other matters to the House, the following policy decisions were made by your designated representatives authorized to conduct Faculty business between House meetings:

- Discussed with Social Security medical officials various health programs and health screening projects conducted at Woodlawn;
- Endorsed a tuberculosis screening project proposed by the Maryland Tuberculosis Association;
- Authorized Faculty representatives to attend meetings in Chicago regarding the proposed revised JCAH standards;
- Authorized appointment of various ad hoc committees (the reports of these committees appear in this compilation of reports under the heading "Special Committees");
- Submitted nominees for appointment to various gubernatorial, state agency, public agency, voluntary agency, etc. positions;

- Approved a proposal to establish a preschool Hearing and Vision Screening Survey under Faculty auspices with the cooperation of other interested groups;
- Authorized legal counsel to file Amicus Curiae briefs in Court of Appeals cases regarding: (a) testimony of a chiropractor in court and disallowance of such testimony, and (b) use of material in obtaining a court conviction of a patient, such material having been provided a physician during the course of treatment;
- Adopted a report dealing with policy on admission of patients to intensive and coronary care units in hospitals;
- Agreed to form an Advisory Committee on Human Trials;
- Agreed to conduct an in-depth study of physician manpower in cooperation with the Department of Health and Mental Hygiene;
- Adopted a report on the Revised Policy on Laboratory Services;
- Authorized renewal of the contract of the Executive Secretary for an additional three-year period on the same terms and conditions as previously accepted;
- Adopted the following amended recommendation of the Ad Hoc Committee to Discuss Multiphasic Screening Programs:

"The Ad Hoc Committee to Discuss Multiphasic Screening Programs concurs with the feasibility report submitted by the Bendix Corporation and recommends its acceptance. It further believes that this concept is worthwhile, even though still in its infant stage and that lines of communication should be kept open with the Bendix Corporation or other groups so that implementation could take place in the event changes occur in our social and environmental setting.

"The Committee also recommends that the Faculty go on record as being interested in instituting such a program under Faculty sponsorship, in the event it does become feasible. The Committee recommends that this subject should be reconsidered at regular six-month periods."

- Adopted the following recommendations of the Mediation Committee with the understanding that this data was to be forwarded to the Drug Abuse Authority when it became effective on July 1, 1969:

"That the Medical and Chirurgical Faculty of Maryland endorses the concept that selected hospitals be encouraged to establish drug abuse treatment centers under their auspices either as part of, or at some reasonable proximity to its hospital facilities under strict professional and administrative controls, and using accepted methods of treatment and ancillary personnel, such as medical social workers, psychologists, nutritionists, etc., as well as psychiatrists, internists, pediatricians, etc.

"It is understood that such selected hospitals must have adequate staffing, resources, financing, space and other facilities and that they would conform with the Ethical Guidelines for the Treatment of Narcotic Addicts, as adopted by the Medical and Chirurgical Faculty."

- Adopted the following policy statement on sex education and family life planning, as amended, after considerable discussion and debate. Karl M. Green, MD, chairman of the Faculty's Subcommittee on Child Welfare of the Committee on Postgraduate Education, Preventive Medicine and Public Health, joined the Council to discuss this proposal:

"The Medical and Chirurgical Faculty of the State of Maryland recognizes that the primary responsibility for sex education will always remain within the home, but the school, church, and some other community agencies have a supplementary role in reinforcing and supporting the efforts of the home.

"The Faculty supports the inauguration and implementation within the school system of a family life and sex education program which will fill the following criteria:

1. That it be part of an overall health education and biology program
2. That it be presented in a manner commensurate with the maturity and emotional level of the students
3. That the sex education course follow a professionally developed and regulated curriculum
4. That the sex education program attempt to involve parents and other members of the community within the classroom teaching situation
5. That the sex education program utilize classroom teachers and other professionals and subprofessionals who have shown an aptitude for working with young people and who have received special training
6. That the sex education program prior to presentation have as consultants, advisors and resource persons: physicians, nurses, and public health personnel, who are responsible for the *development* and guidance of such a curriculum and that the medical societies (both state and components) be encouraged to take an active part."

Respectfully submitted,
JOHN F. SCHAEFER, MD, *Chairman*

SECRETARY

Mr. President and Members of the House of Delegates:

The majority of the work of the Faculty is conducted within committees and the activity resulting from such work is carried out by the various members of the Faculty staff.

The ultimate responsibility for the efficient operation of the Faculty, however, rests with the Secretary who is your elected officer. In this capacity, he serves as an ex-officio member of all committees and subcommittees.

Complete data on committee and other activity of the Faculty is available at the Faculty's headquarters.

Respectfully submitted,
WILLIAM A. PILLSBURY, MD, *Secretary*

EXECUTIVE SECRETARY

Mr. President and Members of the House of Delegates:

On April 15, 1970 I completed 12 years of service with the Faculty. These years have been rewarding for me and, I hope, as equally rewarding for the Faculty and its members.

I believe the Faculty continues to make progress in all fields of endeavor.

While the major role in completion of various projects for the benefit of the public and the profession remains with the various committees and members, I like to feel that I play a small part in accomplishing these goals.

Respectfully submitted,
JOHN SARGEANT, *Executive Secretary*

BYLAWS COMMITTEE

Mr. President and Members of the House of Delegates:

Your Bylaws Committee met on Wednesday, February 4, 1970 to discuss with representatives of the Baltimore City Dental Society and the Maryland State Dental Association the inclusion of members of these organizations on various Faculty Committees.

It was the consensus of the entire group that it would be more preferable to have Faculty Bylaws provide for membership on the following Committees as a representative of the Maryland State Dental Association, rather than the Baltimore City Dental Society as presently written:

Medical Economics Committee
Legislative Committee
Library and History Committee
Professional Medical Services Committee
Program and Arrangements Committee
Public Relations Committee

It was also agreed that no useful purpose was served in having representation of the State Dental Association on the Faculty's Mediation Committee.

Accordingly, the following Bylaw Amendments are offered to the House of Delegates for its consideration:

Amend Article XI, Sections 3, 8, 10, 19, 21 and 22 by striking out "Baltimore City Dental Society" and inserting "Maryland State Dental Association".

OLD (Bracket portion deleted)	NEW (CAPS added)
Section 3. A MEDICAL ECONOMICS COMMITTEE of at least five members shall serve as a Review Committee for health insurance and other third party payors to determine equitable and just fees for procedures performed and for which such carriers are responsible. It may only act on the request of the carrier or patient or physician involved, and after the medical service has been rendered. It shall not determine the legal rights or benefits under such policies. It shall also be empowered to investigate, within the responsibilities and charges designated in these bylaws, areas of economic benefits for members of the Faculty. It shall receive the report of the Faculty's officially approved Professional Liability Program and shall prepare and present an educational program to physicians in this regard. Its chairman shall be appointed by the President and said chairman shall appoint the other members of the Committee with the approval of the President. The (Baltimore City Dental Society) shall have the right to elect one associate member of the Committee with voice but no vote.	Section 3. A MEDICAL ECONOMICS COMMITTEE of at least five members shall serve as a Review Committee for health insurance and other third party payors to determine equitable and just fees for procedures performed and for which such carriers are responsible. It may only act on the request of the carrier or patient or physician involved, and after the medical service has been rendered. It shall not determine the legal rights or benefits under such policies. It shall receive the report of the Faculty's officially approved Professional Liability Program and shall prepare and present an educational program to physicians in this regard. Its chairman shall be appointed by the President and said chairman shall appoint the other members of the Committee with the approval of the President. The MARYLAND STATE DENTAL ASSOCIATION shall have the right to elect one associate member of the Committee with voice but no vote.
Section 8. A LEGISLATIVE COMMITTEE composed of at least five members appointed by the President shall inform itself on all legislation, national, state and local, affecting the practice of medicine; advise the Faculty when necessary in regard to such legislation; and, with the President or such other person as the Council or House of Delegates may name, represent the Faculty before any legislative body when required. The President shall designate the chairman. (The Baltimore City Dental Society) shall have the right to elect one associate member of the committee with voice but without vote. The President shall request each component society annually to appoint a representative to meet with the committee on a consulting basis at the request of the chairman of the committee.	Section 8. A LEGISLATIVE COMMITTEE composed of at least five members appointed by the President shall inform itself on all legislation, national, state and local, affecting the practice of medicine; advise the Faculty when necessary in regard to such legislation; and, with the President or such other person as the Council or House of Delegates may name, represent the Faculty before any legislative body when required. The President shall designate the chairman. The MARYLAND STATE DENTAL ASSOCIATION shall have the right to elect one associate member of the committee with voice but without vote. The President shall request each component society annually to appoint a representative to meet with the committee on a consulting basis at the request of the chairman of the committee.
Section 10. A LIBRARY AND HISTORY COMMITTEE of five members, one of whom shall be elected at the annual session of the House of Delegates each year for a five-year term, shall have the control and supervision of all books, pamphlets, periodicals and written or printed material, including historical material, belonging to the Faculty; shall have authority to order and purchase such additions or replacements as it deems necessary within its budget, and shall prepare and maintain historical records regarding the Faculty and each Faculty Fund. The (Baltimore City Dental Society) shall have the right to elect one associate member of the committee. It shall elect its own chairman.	Section 10. A LIBRARY AND HISTORY COMMITTEE of five members, one of whom shall be elected at the annual session of the House of Delegates each year for a five-year term, shall have the control and supervision of all books, pamphlets, periodicals and written or printed material, including historical material, belonging to the Faculty; shall have authority to order and purchase such additions or replacements as it deems necessary within its budget, and shall prepare and maintain historical records regarding the Faculty and each Faculty Fund. The MARYLAND STATE DENTAL ASSOCIATION shall have the right to elect one associate member of the committee. It shall elect its own chairman.

Section 19. A PROFESSIONAL MEDICAL SERVICES COMMITTEE shall consider and advise the Faculty on all matters relating to the professional services provided to the public by members of the Faculty. It shall not conflict in any way with charges made in these bylaws to other committees of the Faculty. It shall make available facts, data and opinions with respect to timely and adequate rendition of medical care to the public; to investigate matters pertaining to the economics of medical practice and where related, social aspects of medical care; it shall study means for the distribution of medical service to the public consistent with the principles adopted by the Faculty's House of Delegates and the AMA's House of Delegates. It shall be composed of (1) a chairman appointed by the President, (2) five members of the Faculty selected by the President, (3) one general practitioner from each councilor district selected by the President from among a group composed of one nominee elected by each component society and (4) one representative selected by each state-wide specialty group which desires representation. The (Baltimore City Dental Society) shall have the right to elect one associate member of the committee with voice but without vote.

Section 19. A PROFESSIONAL MEDICAL SERVICES COMMITTEE shall consider and advise the Faculty on all matters relating to the professional services provided to the public by members of the Faculty. It shall not conflict in any way with charges made in these bylaws to other committees of the Faculty. It shall make available facts, data and opinions with respect to timely and adequate rendition of medical care to the public; to investigate matters pertaining to the economics of medical practice and where related, social aspects of medical care; it shall study means for the distribution of medical service to the public consistent with the principles adopted by the Faculty's House of Delegates and the AMA's House of Delegates. It shall be composed of (1) a chairman appointed by the President, (2) five members of the Faculty selected by the President, (3) one general practitioner from each councilor district selected by the President from among a group composed of one nominee elected by each component society and (4) one representative selected by each state-wide specialty group which desires representation. The MARYLAND STATE DENTAL ASSOCIATION shall have the right to elect one associate member of the committee with voice but without vote.

Section 21. A COMMITTEE ON PROGRAM AND ARRANGEMENTS of four members, one of whom shall be elected at the annual session of the House of Delegates each year for a four-year term, shall prepare and issue a program for General Meetings, provide suitable accommodations for the meetings of the Faculty and have charge of all arrangements. The member whose term next expires shall be chairman. The (Baltimore City Dental Society) shall have the right to elect one associate member of the committee with voice but without vote.

Section 21. A COMMITTEE ON PROGRAM AND ARRANGEMENTS of four members, one of whom shall be elected at the annual session of the House of Delegates each year for a four-year term, shall prepare and issue a program for General Meetings, provide suitable accommodations for the meetings of the Faculty and have charge of all arrangements. The member whose term next expires shall be chairman. The MARYLAND STATE DENTAL ASSOCIATION shall have the right to elect one associate member of the committee with voice but without vote.

Section 22. A PUBLIC RELATIONS COMMITTEE of at least five members shall undertake to supply speakers to organizations requesting them on subjects relating to the practice of medicine; undertake such methods as it deems advisable to inform and instruct the public generally on subjects related to the practice of medicine; issue to the press and other media of public information releases relating to the meetings, actions and activities of the Faculty, with the advice and approval of the President or Executive Secretary, and serve in an advisory capacity to the Woman's Auxiliary. Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the President. The (Baltimore City Dental Society) shall have the right to elect one associate member of the committee with voice but without vote.

Section 22. A PUBLIC RELATIONS COMMITTEE of at least five members shall undertake to supply speakers to organizations requesting them on subjects relating to the practice of medicine; undertake such methods as it deems advisable to inform and instruct the public generally on subjects related to the practice of medicine; issue to the press and other media of public information releases relating to the meetings, actions and activities of the Faculty, with the advice and approval of the President or Executive Secretary, and serve in an advisory capacity to the Woman's Auxiliary. Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the President. The MARYLAND STATE DENTAL ASSOCIATION shall have the right to elect one associate member of the committee with voice but without vote.

Amend Article XI, Section 11 by striking out the last sentence thereof:

"The Baltimore City Dental Society shall have the right to elect one associate member of the Committee with voice but without vote in all committee deliberations except those relating to grievances or complaints."

OLD

(Bracket portion deleted)

Section 11. A MEDIATION COMMITTEE composed of the five most recent living Immediate Past Presidents, not serving on the Commission on Medical Discipline and at least five additional members appointed by the President shall hear and determine all grievances or complaints and formulate guidelines involving or growing out of the practice of medicine as provided by these bylaws and mediate all problems involving or growing out of the practice of medicine. The chairman shall be appointed by the President. (The Baltimore City Dental Society shall have the right to elect one associate member of the committee with voice but without vote in all committee deliberations except those relating to grievances or complaints.)

NEW

(CAPS added)

Section 11. A MEDIATION COMMITTEE composed of the five most recent living Immediate Past Presidents, not serving on the Commission on Medical Discipline and at least five additional members appointed by the President shall hear and determine all grievances or complaints and formulate guidelines involving or growing out of the practice of medicine as provided by these bylaws and mediate all problems involving or growing out of the practice of medicine. The chairman shall be appointed by the President.

Amend Article II, Section 2, Subsection (a) (6) by striking out "Society" and inserting "Association":

OLD

(Bracket portion deleted)

Section 2. (a) ASSOCIATE MEMBERS shall consist of all associate members of all component societies who are (1) Doctors of Medicine who are not engaged in the full-time practice of medicine; (2) Doctors of Medicine engaged in the practice of medicine and in full-time positions in a medical school, having a rank below that of associate professor; (3) Doctors of Medicine on the resident staff of a hospital, or holding a fellowship, and not in private practice; (4) persons holding academic degrees equivalent to the degree of Doctor of Medicine devoting their full-time to the study and teaching of the medicine sciences, the determination that the degree is equivalent being made in each case by the component society; (5) commissioned medical officers of the armed forces, public health service and Veterans Administration; (6) members of the Maryland State Dental (Society) in good standing with that Society, other than those outlined in (5) preceding; and (7) members of the Baltimore City Dental Society in good standing with that society.

NEW

(CAPS added)

Section 2. (a) ASSOCIATE MEMBERS shall consist of all associate members of all component societies who are (1) Doctors of Medicine who are not engaged in the full-time practice of medicine; (2) Doctors of Medicine engaged in the practice of medicine and in full-time positions in a medical school, having a rank below that of associate professor; (3) Doctors of Medicine on the resident staff of a hospital, or holding a fellowship, and not in private practice; (4) persons holding academic degrees equivalent to the degree of Doctor of Medicine devoting their full-time to the study and teaching of the medicine sciences, the determination that the degree is equivalent being made in each case by the component society; (5) commissioned medical officers of the armed forces, public health service and Veterans Administration; (6) members of the Maryland State Dental ASSOCIATION in good standing with that Society, other than those outlined in (5) preceding; and (7) members of the Baltimore City Dental Society in good standing with that society.

No changes are offered in Article II, Section 2 of the Bylaws dealing with membership classifications, as associate membership is already available to members of the Maryland State Dental Association. Members of the Baltimore City Dental Society are required to be members of the State Dental Association and such membership is directly from the local Dental component to the Faculty. When and if members of the State Dental Association wish to become members of the Faculty, application would be made directly to the Faculty.

In a previous meeting on October 15, 1969, the following Bylaw changes were also discussed and are also offered to the House of Delegates for its consideration:

1. Change title of Executive Secretary to Executive Director.

Article VI, Section 4:

(CAPS added)

Section 5. The Council shall employ under contract an EXECUTIVE DIRECTOR...

2. Change provision for transfer of members from one Component Society to another.

Article I, Sections 4 and 5:

OLD

(Bracket portions deleted)

Section 4. Component societies shall be the judges of the qualifications of their own members, provided that they may admit to membership every reputable and legally registered doctor of medicine who does not practice, claim to practice or support any exclusive system of medicine and who (1) is not a member of another component society, and (2) maintains his principal office within its area, or (3) maintains his residence within its area and the society in whose area he maintains his principal office consents. If a physician also maintains an office in the area in which he resides, he may choose to apply for membership in either the component society in whose area he resides or has his principal office. If, due to moving either his office or residence, a physician becomes ineligible to continue his membership in a component society, his membership must be transferred to the appropriate component society within sixty days.

NEW

(CAPS added)

Section 4. Component societies shall be the judges of the qualifications of their own members, provided that they may admit to membership every reputable and legally registered doctor of medicine who does not practice, claim to practice or support any exclusive system of medicine and who (1) is not a member of another component society, and (2) maintains his principal office within its area, or (3) maintains his residence within its area and the society in whose area he maintains his principal office consents. If a physician also maintains an office in the area in which he resides, he may choose to apply for membership in either the component society in whose area he resides or has his principal office. If, due to moving either his office or residence, a physician becomes ineligible to continue his membership in a component society, his membership must be transferred to the appropriate component society within sixty days UNLESS MUTUALLY AGREEABLE TO BOTH COMPONENT SOCIETIES TO WAIVE THIS REQUIREMENT.

OLD	NEW
Section 5. Component societies shall transfer the membership of any member upon request without cost to another component society in which the member's application has been accepted provided the member is in good standing.	Section 5. Component societies shall transfer the membership of any member upon request without cost to another component society in which the member's application has been accepted provided the member is in good standing. MEMBERS WHO APPLY FOR TRANSFER SHALL REMAIN MEMBERS IN GOOD STANDING OF THE COMPONENT SOCIETY FROM WHICH THEY REQUEST TRANSFER UNTIL SUCH TIME AS THEIR TRANSFER IS ACTED UPON EITHER ACCEPTING OR REJECTING SUCH TRANSFER OF MEMBERSHIP.

3. Amend Article XIV by adding new Section 12 as follows:

OLD	NEW
(Bracket portions deleted)	(CAPS added)
(None)	Section 12. NOTWITHSTANDING THE ABOVE PROVISIONS OF THIS ARTICLE, ANY MEMBER OF THE FACULTY WHOSE LICENSE TO PRACTICE MEDICINE AND SURGERY IS SUSPENDED OR REVOKED BY AN ORDER OF THE COMMISSION ON MEDICAL DISCIPLINE WHICH HAS BECOME FINAL PURSUANT TO THE LAW SHALL SUFFER SUSPENSION OR EXPULSION, RESPECTIVELY, OF FACULTY MEMBERSHIP FOR THE SAME PERIOD OF TIME AND UPON THE SAME CONDITIONS AS CONTAINED IN THE COMMISSION'S ORDER. THE PROVISIONS OF THIS SECTION SHALL BE SELF-EXECUTING AND SHALL TAKE EFFECT AT THE TIME THE COMMISSION'S ORDER SHALL BECOME FINAL.

The Bylaws Committee also recommends the following new Bylaw which will create formal recognition of a Committee on Peer Review. This is in line with a request from the American Medical Association's House of Delegates; as well as the various third party and governmental agencies involved in the payment of medical care.

Amend Article XI, by inserting after Section 16, the following new section (all remaining sections being automatically renumbered); provided that the initial appointments to the Committee shall decide by lot the lengths of their initial terms:

OLD	NEW
(None)	(CAPS added)
	THE PRESIDENT SHALL APPOINT A PEER REVIEW COMMITTEE OF NINE MEMBERS, THREE OF WHOM SHALL BE APPOINTED ANNUALLY FOR THREE-YEAR TERMS. IT SHALL BE THE DUTY OF THIS COMMITTEE TO ADVISE THIRD PARTY AND OTHER AGENCIES AS TO THE APPROPRIATENESS OF MEDICAL CARE RENDERED BY MARYLAND PHYSICIANS IN INSTITUTIONS AND OFFICES OR OTHER LOCATIONS WHERE HEALTH CARE IS RENDERED. IT SHALL DEVELOP SUITABLE CRITERIA TO ADEQUATELY EVALUATE THE INDIVIDUAL AND COLLECTIVE VOLUME, COST AND QUALITY OF MEDICAL CARE WHEREVER PROVIDED. THE COMMITTEE SHALL STIMULATE AREA HOSPITALS' MEDICAL STAFFS TO DEVELOP APPROPRIATE MECHANISMS SUCH AS UTILIZATION COMMITTEES FOR REVIEW OF HOSPITAL ADMISSIONS WITH RESPECT TO NEED FOR ADMISSION, LENGTHS OF STAY, DISCHARGE PRACTICES AND EVALUATION OF SERVICES ORDERED AND PROVIDED. THE CHAIRMAN SHALL BE DESIGNATED ANNUALLY BY THE PRESIDENT.

Respectfully submitted,

Charles F. O'Donnell, MD, *Chairman*
Arthur E. Cocco, MD
DeWitt E. DeLawter, MD
Vincent J. Fiocco, Jr., MD

BOARD OF MEDICAL EXAMINERS

Mr. President and Members of the House of Delegates:

The Board of Medical Examiners is composed of the following members whose terms expire on the dates indicated below:

Elmer G. Linhardt, MD 1970
William L. Stewart, MD 1970
J. Roy Guyther, MD 1971
Gerald A. Galvin, MD 1971
Karl F. Mech, MD 1972
Archie R. Cohen, MD 1972
John E. Adams, MD 1973
DeWitt E. DeLawter, MD 1973

As the terms of Elmer G. Linhardt, MD, and William L. Stewart, MD, expire June 1970, two members to serve until 1974 are to be elected at the meeting of the Medical and Chirurgical Faculty.

Examinations given during the year show the following results:

Applications received for examination		557
Second year students examined and reexamined		61
Postponed, withdrawn or did not appear		106
Failed to complete		1
Not eligible for license		168
Examined in second part of examination		50
Complete examination		204
Reexamined		135
Eligible for license		389
Passed—American Graduates	87	
Passed—Foreign Graduates	113	
Failed—American Graduates	34	
Failed—Foreign Graduates	155	

American Graduates who failed are as follows:

Univ. Colorado—1; Howard Univ.—21; Meharry Med. Col.—2; Women's Col. of Pa.—2; Univ. Puerto Rico—2; Univ. Washington—1; Univ. West Virginia—1; Johns Hopkins Univ.—1; Univ. Maryland—3.

Licenses issued after examination	200
Licenses issued by endorsement of National Board Certificate	344
Licenses issued by reciprocity with other State Licenses	203
Total licenses issued	747
Licenses revoked	0
Licenses suspended	1
Licentiates certified to other states	366
Copies of licenses issued	15
American graduates examined and reexamined	182
Foreign graduates examined and reexamined	388
Foreign graduates approved for examination	448
Written inquiries from foreign graduates (approximately)	800
Office interviews from foreign graduates (approximately)	400
Telephone inquiries from foreign graduates (approximately)	1,500
Telephone inquiries concerning registration of physicians	3,000
Registration certificates issued from 1/1/69 to 12/31/69	4,989

Licensed by Special Examination

Palem S. Rao, MD—December 18, 1969

Suspension of Medical License

On June 30, 1969, the license of *Alfred J. Cole, MD,* was suspended for 60 days for failure to prepare, obtain and keep complete and accurate records of certain depressant and stimulant drugs as required by federal law.

On April 24, 1969, the suspension of the license of *Miller Maurice Ryans, MD,* was terminated.

Reprimands

Carlos Alvarado, MD, appeared before the Executive Committee on December 20, 1968, with regard to his practicing as an unlicensed physician. Dr. Alvarado was notified that administrative duties were permissible under the Medical Practice Act. He was further notified that any future violation of the Medical Practice Act would be referred to the proper authority for prosecution.

William Hugh L. Westbrook, Jr., MD, appeared before the Executive Committee on January 16, 1969. It was the decision of the Executive Committee, in view of his limited capacity, that he be permitted to continue in his field of practice under direct supervision.

Oscar B. Camp, MD, and Joseph J. Cameron, MD, appeared before the Executive Committee on January 16, 1969, to discuss their association with the Eastpoint Medical Center with regard to advertising. It was their decision to resign from the Board of Directors of Eastpoint Medical Center and disassociate themselves from the center.

Luis Cuza, MD, appeared before the Executive Committee on January 16, 1969, and gave a satisfactory report of his professional activities. An order from the U.S. District Court, terminating the probation of Dr. Cuza, was presented to the Board for consideration of terminating the Board's probationary period of Dr. Cuza. It was the decision of the Board, on June 3, 1969, to terminate this probation, after first discussing with Dr. Cuza the importance of adhering to the provisions of the law as established by the Commission on Medical Discipline.

William L. Johnson, MD, an unlicensed, unregistered physician in the State of Maryland, has been allegedly circulating literature with regard to activities involving sex power, etc. This has been referred to the State's Attorney for Baltimore city for necessary action.

Marvin A. Jackson, MD, appeared before the Executive Committee on March 13, 1969, with regard to advertising in the *Baltimore Afro-American.* Dr.

Jackson stated he was unaware this advertisement was being run. Dr. Jackson notified the particular laboratory involved, and a copy of the letter was forwarded to the Executive Committee.

Carlos Arrabal, MD. It was the decision of the Executive Committee to terminate the regular reportings of Dr. Arrabal to the Executive Committee. He has been notified that we are available to him at any time for consultation, if he so desires.

Dahmes Gounarnis, MD. The Board was notified that Dahmes Gounarnis was practicing medicine in Maryland without a license, located in a garage behind the office of Harry Deibel, MD. There is nothing in our files to indicate that this individual is a qualified doctor of medicine. The matter was referred to the State's Attorney's office and the Attorney General's office for investigation and action. A letter was received from Harry Deibel, MD, stating that his association with Dr. Gounarnis was severed as of June 27, 1969.

Clinton Community Hospital, Inc. A letter was received from Dr. Merkle, Director of Clinton Community Hospital, Inc. regarding the employment of unlicensed physicians. It was the decision of the Board to notify Dr. Merkle that these physicians are in violation of the Medical Practice Act in view of the fact that they do not possess a Maryland medical license and do not qualify in an approved training program, citing Article 43, Sections 130, 131, and 139 of the Annotated Code of Public General Laws of Maryland, 1957 Edition, 1968 Supplement.

Cases being referred to the Medical and Chirurgical Faculty—Commission on Medical Discipline

Under Article 43, Section 145, the following cases have been referred to the Medical and Chirurgical Faculty for investigation or referral to the Commission on Medical Discipline or both:

G. R. Sadjadi, MD	G. Franklin Phillips, MD
George H. Beck, MD	E. A. Purnell, MD
Milton J. Wohl, MD	Milan M. Vuitch, MD
Joshua Mitchell, MD	Morris A. Jacobs, MD
John F. Coolahan, MD	Charles J. Savarese, MD
Harry L. Hinson, MD	Wilfred H. Ehrmantraut, MD
Barnett Rhetta, MD	

Surrender of Medical License

John Gordon Rennie, MD. It was the decision of the Board to hold a hearing for consideration of revocation or suspension of Dr. Rennie's license in August, 1969. Dr. Rennie notified the Board that he would voluntarily surrender his license to practice medicine in Maryland. It was the decision of the Board to accept voluntary surrender of Dr. Rennie's license. This license was received on May 16, 1969.

Archie C. Lewis, MD, has voluntarily surrendered his license to practice medicine in the State of Maryland, as of October 2, 1969.

Elizabeth Reese Wilkens, MD, has voluntarily surrendered her license to practice medicine in the State of Maryland, as of October 7, 1968. She has notified this office that she is unable to locate the actual document. She is now residing at Horton's Boarding Home, Union Bridge, Maryland.

Robert M. Hening, MD, has voluntarily surrendered his license to practice medicine in the State of Maryland, as of October 28, 1969.

Commission on Medical Discipline

The following Board members were elected to serve on the Commission on Medical Discipline: Archie R. Cohen, MD, Elmer G. Linhardt, MD, and Karl F. Mech, MD.

Leonard H. Flax, MD

A letter dated July 22, 1969, from Dr. Flax was received in which he requested information relative to giving refresher courses to physicians being re-examined by the Board. Dr. Flax was notified that it is the present policy of the Board not to approve refresher courses to be given by individual physicians, but only those of an official educational institution. Grades obtained by examinees are not furnished to anyone other than the examinee or officially recognized licensing Boards of other states.

Filing of Board Rules and Regulations

In accordance with Chapter 797 of the Laws of Maryland, effective July 1, 1969, current rules and regulations of the Board of Medical Examiners were filed with the appropriate state agencies.

Maryland Tuberculosis Association, Inc.

A letter was received from the Maryland Tuberculosis Association, Inc. inquiring as to what level of personnel would legally be required for administering and measuring tuberculin tests. The association was notified to the effect: "A discussion of the procedures that could be performed by registered nurses, with a licensed physician taking full responsibility, resulted in the following suggestions provided by the Maryland Nurses Association and adopted by the Council of the Medical and Chirurgical Faculty on June 17, 1965. To wit: Generally, if the act performed by the registered nurse is basically mechanical, not requiring the exercise of medical judgment, and is done by order of or supervision by a physician, it is legal. In regard to the nurse interpreting the test, this would be contrary to the Medical Practice Act."

Sixty-Fifth Annual Congress on Medical Education and Licensure

Doctors Karl F. Mech, Vernon H. Norwood and Elmer G. Linhardt attended the congress held in Chicago, Illinois, February 7-10, 1969.

Respectfully submitted,
ELMER G. LINHARDT, MD, *Executive Secretary*

CURATOR

Mr. President and Members of the House of Delegates:

Material of historic interest to the profession and the Faculty continues to flow into the Faculty offices and we are most grateful that an appropriate repository exists for this data.

Items received during the past year include:

Surgical instruments owned by William E. Woodall, an employee of the Baltimore City Health Department from about 1888 to 1936. They were used by him to release accumulated gas from abandoned cadavers of smallpox victims "around the turn of the century." These were a gift of his nephew, Mr. Denwood N. Kelly, of Baltimore.

(These items, along with others in our collection, have been placed on permanent loan to the Carroll County Medical Society for its Farm Museum.)

From Louis A. M. Krause, MD, of Baltimore:

Studies in Rabies, a testimonial volume, 1909, by Nathaniel Garland Kierle, LLD;
Sphygmomanometer; speculums; skull; assorted instruments

From an anonymous donor, a relative of Solomon C. Katzoff, MD, 1879-1968:

6 ampules of sterile water, 5 cc in size; glass mortar and pestle; stethoscope; nickel container with hypodermic syringe, 2 needles and 6 empty glass vials; obstetrical forceps; leather case containing small instruments; metal box containing "improved prescription scale": (The D.C.H. Fitch); metal box containing "improved antitoxin syringe" by K. K. Mulford Co., of Philadelphia; 10 miscellaneous instruments.

The Faculty also received, through the kindness of Raymond C. Markley, MD, of Baltimore, the following material from Mrs. Charlotte White:

Assorted instruments and a cardboard box of needle tubes which belonged to her husband, William Kelso White, MD.

(Dr. Markley requested these be retained by him on permanent loan for use at University of Maryland Hospital, and for display in his private office.)

In each case, the donor of the gift, when known, has been suitably thanked and the item has been recorded in the accession records of the Faculty.

During the year, the Faculty had on display in the Pratt Library window on Cathedral Street in Baltimore, a medicine chest owned by Robert Moore, MD, 1764-1844. This was in honor of Doctors' Day in 1969, sponsored by the Woman's Auxiliary to the Baltimore City Medical Society, with credit given to the Faculty.

As has been authorized and carried out each year, the sum of $500 has been expended for restoration and care of the large portrait collection belonging to the Faculty and exhibited in its headquarters.

Respectfully submitted,
E. David Weinberg, MD, *Curator*

DELEGATES TO THE AMA HOUSE OF DELEGATES

NOVEMBER 30—DECEMBER 3, 1969 DENVER

Mr. President and Members of the House of Delegates:

Your three delegates and the senior alternate delegate attended the Clinical Meeting of the American Medical Association House of Delegates in Denver, Colorado, November 30 through December 3, 1969. Russell S. Fisher, MD, served as chairman of one of the reference committees reporting to the House, and was an able representative from the Free State of Maryland. The other delegates and alternate delegates attended various Reference Committee hearings, discussed resolutions and reports, and reported to the entire delegation the comments and discussions that took place at these sessions. The delegation also met with numerous Trustees in informal discussions of multiple medical problems.

This meeting was one of the least controversial and most productive held in many years. It was not marked by demonstrations, as was the Annual Session in July 1969, probably because a decision had been made prior to the meeting to quickly and quietly deny the floor to any individuals who demanded the right to speak at any of these sessions.

In addition to the official delegation from the state being present at the House of Delegates sessions, the Executive Secretary attended sessions of the American Association of Medical Society Executives; as well as an all-day Peer Review session in Denver held just prior to the meetings of the House of Delegates.

(A complete report of the transactions may be found in JAMA)

Respectfully submitted,
Robert vL. Campbell, MD
J. Sheldon Eastland, MD
Russell S. Fisher, MD
Charles F. O'Donnell, MD, *Senior Alternate*

COMMITTEE ON EMOTIONAL HEALTH

Mr. President and Members of the House of Delegates:

The Committee on Emotional Health has had monthly meetings during the past year with many current issues considered and recommendations made. At one meeting the State Budget for Mental Health Plans was reviewed and discussed with Alice Tobler, MD, chairman of the State Department of Mental Hygiene committee that studied the Maryland State Comprehensive Plan for Community Mental Health Services, and James E. Carson, MD, Commissioner of Mental Hygiene for Maryland. Included in this discussion were Community Mental Health Services.

At another meeting, Joseph Baker, MD, from the Department of Mental Health of the American Medical Association was present and many matters were discussed from both a national and a local level.

The membership of the committee was divided into groups of two each to study the following specific broad subjects: (1) means of expediting services for acute psychiatric patients; (2) mental health services for children and adolescents; (3) services for the aged with psychiatric problems; (4) drug abuse and alcoholism; and (5) the general area of psychiatry and the law.

The committee supported a bill in the State Legislature to permit persons between the ages of 18 and 21 to receive psychiatric consultation and treatment without parental consent. A resolution was submitted to the Faculty regarding the transportation of emotionally disturbed patients from the community to psychiatric care facilities. The resolution was approved by the Executive Committee, but the Council declined to adopt the resolution as presented. The committee has again considered the resolution and reworded it to make it more clearly understood what is being recommended. This will be presented again to the Council for action.

Considerable thought and discussion have been given to the problem of the use of marihuana, including its possible legalization, and the present legal penalties which equate it with hard-core narcotics. The committee went on record as being in support of the prefiled bill for the State Legislature regarding penalties for use of marihuana. The policy statement of the AMA regarding marihuana was reviewed and a copy has been sent to the superintendents of schools in all the counties in Maryland. To date, several requests have been received for additional copies of the policy statement to be sent to the principals of all schools in certain counties.

The mental health services for children and adolescents are being looked into extensively. Some members of the committee have personally visited the state training schools. Plans are being made to hold the next committee meeting at one of the state mental hospitals in order to see what can be done to correct the undesirable situation present in many of these hospitals. The superintendent and staff physicians of the state hospital will be invited.

A resolution regarding psychiatric services for the aged is being submitted to the Executive Committee of the Faculty with the recommendation that it be made Faculty policy. A seminar on psychiatric units

in general hospitals is being planned at Prince George's General Hospital this spring. Also, a member of the committee will be one of the moderators at the Round Table Luncheon, held in conjunction with the Annual Meeting of the Faculty. The title of his discussion is "Psychiatric Admissions to General Hospitals."

The many bills regarding mental health, including narcotics, which are being introduced at the 1970 session of the State Legislature, are being studied and recommendations will be made.

Two members of the committee represented the Faculty at the Annual Conference of State Mental Health Representatives held by the AMA in Chicago in March. They went at their own expense as funds were not available from the AMA.

Respectfully submitted,

EXALL L. KIMBRO, JR., MD, *Chairman*
EDUARD ASCHER, MD
RICHARD H. EDENBAUM, MD
AUGUSTO J. ESQUIBEL, MD
THEODORE M. FELDBERG, MD
ERNEST E. HARMON, MD
STEPHEN A. HIRSCH, MD
JOSEPH P. NORRIS, MD
LOUIS W. TINNIN, MD
WITOLD V. WINIARZ, MD
ALAN B. ZIENTS, MD

FINANCE COMMITTEE

Mr. President and Members of the House of Delegates:

The Finance Committee met with a counselor of the T. Rowe Price Company and reviewed the investment portfolio of the Faculty's special dedicated funds.

The market value of the portfolio was down 0.2% on December 31, 1969 compared to December 31, 1968. It is encouraging to note, however, that our portfolio compares favorably with the two popular market averages and the average of all mutual funds as indicated:

Standard & Poor 500	Off 11.4%
Dow Jones Industrial Average	Off 15.2%
Average of all Mutual Funds	Off 14.5%
Medical Faculty	Off 0.2%

At the year end, the total market value was $1,093,-283.29. The approximate income of the portfolio was $31,323.91. The yield on invested capital was 3.4%.

The request of the Postgraduate Committee that MEDIC be approved for a period of five years was discussed by the committee. The Treasurer pointed out that the limited funds of the educational fund would not cover the cost of MEDIC for five years. The committee agreed that approval of the program should be considered for only one year at a time.

The Treasurer advised the committee of the proposed Bylaw amendment of the Montgomery County Medical Society to establish an ad hoc committee to make recommendations to the Finance Committee with regard to the Faculty budget. The Treasurer will carry out the wishes of the House of Delegates, but opposes the proposal for several reasons. The function of the proposed committee is now being performed by the Executive Committee, made up of Council and House of Delegates electees who are most familiar with the Faculty operations and are more knowledgeable of the requirements and responsibilities of the Faculty than the proposed committee might be. Also, the requirement that facts and figures be made available six months in advance is not practical. The information obtained at such an early date would be of little value for preparation of the budget. The financial records through 11 months of the year are presently used in budget preparation. The Finance Committee agreed that the amendment should be opposed.

The committee was apprised of the deficit budget for 1970, and the efforts of the Executive Committee to eliminate or reduce the deficit. The Treasurer indicated that every effort will be exerted to operate within a balanced budget, but due to rapidly rising costs, the Faculty may have to consider increasing membership dues.

Respectfully submitted,

KARL F. MECH, MD, *Chairman*
M. MCKENDREE BOYER, MD
A. C. DICK, MD
E. W. DITTO, JR., MD
THEODORE G. OSIUS, JR., MD

LEGISLATIVE COMMITTEE

Mr. President and Members of the House of Delegates:

The 1970 General Assembly session was one of the most active sessions during my tenure in office as legislative chairman. The lack of newspapers during most of the session necessitated daily visits to Annapolis by Faculty representatives to ensure that we were current with all legislation introduced.

Committees of the Legislature commenced working almost immediately following opening of the session. This is an almost unheard of phenomenon. Bills of interest to the profession were among the first heard in committee.

It is not necessary to brief you in this report on the various highlights of bills that were heard. Full details are contained in *The Assemblyman* which was mailed to all members during the session and immediately following adjournment. During the session it is almost a full-time task to keep abreast of legislative activity. Printing delays and work delays prevent issuing reports to the membership as often as we would like.

The committee cannot emphasize too much the importance of the assistance given the Faculty's representatives when component society members meet with their legislative delegation to discuss proposed or pending legislation. Such meetings do much to cement relationships and make our spokesmen in Annapolis known to individual delegates and senators.

This year, it was not necessary to form subcommittees to consider various legislative proposals. However, in line with the position of the Faculty to be on the offensive rather than on the defensive, it is planning to consider various legislative ideas during the summer months with a view to requesting sponsorship of legislation in the 1971 General Assembly. Details will be forthcoming at a later date.

In line with Faculty positions on various policy matters, testimony was presented at innumerable legislative hearings both during the General Assembly and during the summer months at Legislative Committee sessions.

Following procedure adopted last year, the Legislative Committee held its meetings over the MEDIC network thus obviating trips to Baltimore by many of the component society legislative representatives.

The First Aid Room was again in operation during the 1970 General Assembly Session and during the special legislative session held in late 1969. It was also activated during the all-day hearing conducted by the Governor in connection with the Abortion Repeal Bill (House Bill 489). We are again indebted to the Maryland Academy of General Practice for its provision

of physicians on call during the latter part of the session.

Respectfully submitted,

B. Martin Middleton, MD, *Chairman*
Marshall Diamond, MD
John Fenwick, MD
Stephen K. Padussis, MD
J. Morris Reese, MD
Roland T. Smoot, MD
C. C. Spencer, MD
William A. Williams, MD
Elmer Linhardt, MD
John Cappuccio, DDS
Mrs. DeWitt E. DeLawter

LIAISON COMMITTEE

Mr. President and Members of the House of Delegates:

Only two meetings of the main Liaison Committee were held during the past year. However, the various subcommittees met on a regular basis as subjects for discussion necessitated such meetings. The Nursing Liaison Subcommittee met on four occasions, as did the Nursing Home Liaison Subcommittee. The Pharmacy Liaison Subcommittee met once.

The former subcommittee on Medicine and Religion became a full standing committee at the Annual Meeting in 1969 and, therefore, the responsibilities of the Liaison Committee in this connection ceased.

In addition to the activities of the subcommittees reported below, the Liaison Committee determined that it would be desirable to establish some type of liaison with hospital emergency room personnel and other groups involved in emergency care. As a consequence, it decided to invite representatives from the State Police, Hospital Council, Emergency Room Physicians, and others, to attend a future meeting of the committee.

William L. Stewart, MD, was designated to work with the State Health Department and the State Scholarship Bureau on details of areas of need where physicians could fulfill their scholarship obligations in the State of Maryland. This has been accomplished and the guidelines have been revised.

Nursing Liaison Subcommittee

This subcommittee considered a proposed protocol for Mobile Coronary Care Units at the request of the Montgomery County Medical Society. This necessitated modification of the Faculty's position with respect to nurse responsibilities in Coronary Care Units of hospitals.

Also considered is the practicality and ethicality of individuals other than licensed health professionals interpreting tuberculin tests obtained through a mass survey by the Baltimore City Health Department. It was determined that "technicians" (who are unlicensed) should not become involved in anything that required medical judgment. Mechanical procedures, however, could be performed by such individuals after qualifying training, the subcommittee determined.

A representative of the subcommittee attended the second National Nursing Conference held in Chicago on April 11-12, 1969 and reported to the subcommittee that Maryland is far ahead of most other states in defining the responsibilities of registered nurses and other nursing personnel.

The subcommittee has also given consideration to the use of paramedical personnel, both in and outside of institutional settings. Three guidelines must be used in determining the degree of professional care required in given cases: mechanical procedure, use of judgment and the training of the individual. This will be a subject for discussion at future meetings.

At another meeting, the entire Nurse Protocol was examined and revised where necessary. This was submitted to the Executive Committee which approved the revisions. The proceeding was published in the *Maryland State Medical Journal.*

Discussion is still taking place with respect to protocol for nurse-midwives. It had been planned, by interested parties, that legislation would be introduced defining what activity such persons could engage in. However, attempts are being made to treat nurse-midwives as all other registered nurses and define their practices in the protocol as agreed to by all groups involved.

Nursing Home Liaison Subcommittee

This subcommittee discussed proposed legislation for licensure of nursing home administrators as required under federal law July 1, 1970. It also discussed its responsibilities and whether or not it should establish guidelines for medical practice in nursing homes.

Discussion also took place with regard to the reasonableness of the nonreimbursable items in nursing homes under Medicaid; as well as guidelines for Classifications of Nursing Home Facilities.

Pharmacy Liaison Subcommittee

During the year it was learned that despite ethical rulings by both the Maryland Pharmacy Association and the Faculty, the C&P Telephone Company has determined it can take no action to deny "direct lines" between a physician's office and a pharmacy.

At the one subcommittee meeting, discussion centered around activities of physicians and their use of prescriptions. Some apparently indicate "DO NOT REFILL WITHOUT PERMISSION" or "DO NOT DISCUSS WITH PATIENT". The chairman indicated that he would speak to the physician involved and ascertain the necessity for doing this as policy on this is already established in the Pharmacist/Physician Code of Cooperation.

Other matters discussed included the proposed legislation that would prohibit dispensing of cough syrups containing narcotics (in Baltimore city) without a physician's Rx; as well as the Generic Prescribing Bill that was enacted in 1969.

Respectfully submitted,

John Kehoe, MD, *Chairman*

H. Leonard Warres, MD

LIBRARY AND HISTORY COMMITTEE
FINNEY FUND COMMITTEE

Mr. President and Members of the House of Delegates:

The Library and History Committee held very few meetings during 1969, but progress was accomplished toward modernization of furnishings, more efficient use of space, weeding of the collection, and revising the catalog and classification systems. All these activities contribute to a more comfortable working arrangement

of the library reading room area, as well as updating our library system throughout.

The long table was replaced by one reference table for current indices which are constantly in use, plus three carrels for individual study, and a 72-drawer catalog cabinet to match the one purchased earlier. This frees space occupied by the table alone. Despite this and the removal of all History of Medicine volumes to the stack area, near the rare books, the Reading Room is not adequate for the collection now housed there, dating from 1950 publications. The Periodical Room is more crowded than ever and there seems to be no solution to this problem. Space for expansion of bound journals is nonexistent. We continue to discard duplicates and segregate volumes of books and journals for auction later.

In September two part-time staff members resigned, Mrs. Jane Parsons and Miss Beatrice Marriott, and were not replaced. This caused a lag in ordering new materials and processing same, and reduced the number of literature searches the staff was able to make. Also, Mrs. Margaret Gross, clerical assistant, was forced to resign because of illness. She was replaced by Mrs. Susan Saylor for one and a half months until her husband was transferred and she, too, had to move. With these handicaps it was a rather rugged year for the library.

The librarian participated in several local and regional programs, serving as Medical Society Group Chairman at the Medical Library Association annual meeting in Louisville, Kentucky in October where Mr. Lee Ash spoke about the various medical library surveys he has conducted around the country, including, of course, our own. W. I. Hume, Jr., MD, president of the Jefferson County Medical Society in Kentucky, also spoke. Mrs. Sanford also attended the International Congress for Medical Librarianship in Amsterdam, May 5-9, 1969.

The Library furnished the usual collections of books for the Med-Chi Annual and Semiannual meetings, as well as an exhibit for the Sports Seminar in the fall for which we updated the bibliography of Sports Medicine, started several years before. Another bibliography, *Emergency Room Management,* was requested for listing by The National Institutes of Health.

The "Ash Project" to establish the History and Rare Book Division of the Library is nearing completion. This has been a major effort in selecting material to be housed in the division. Several thousands of books have been chosen by our consultant and we are beginning to catalog them correctly and put them into a semblance of order so that they can at last be useful to researchers.

Next steps are to inventory the *old* "C" (rare book) collection, compare duplicate copies throughout the division, and then select such duplicates and out-of-scope books as can be sold at public auction for the benefit of the library. This is to be done as soon as possible.

The consultant has begun to examine the thousands of rare pamphlets (many are "classics" of medicine) that are either loose or bound together in "pamphlet volumes". Many of these are of unusual value and will probably prove to be saleable duplicates or out-of-scope items. Also, the Osler Collection (books and pamphlets, and letters by or about him) is being put in order at last, a project that will be completed this summer by student help working under Mr. Ash's direction. This summer we hope to begin a project to bring Med-Chi's large collection of unique manuscript materials and prints under a control and conservation program.

Since no History and Rare Book Division librarian has been hired, Med-Chi is fortunate to be able to continue to have the attentive supervision of its consultant in order to help establish and arrange its collection into what will become one of the nation's leading research resources.

LIBRARY STATISTICS—1969

Circulation	
Books	3,360
Journals	6,362
Pamphlets (V.F.)	350
Total	10,072
Interlibrary Loans	
Interlibrary loans requested by Med-Chi (outgoing)	369
Interlibrary loans requested by other libraries (incoming) (This includes local requests charged out at circulation desk)	4,518
Attendance	2,251
Courtesy cards issued	10
Gifts	
Books	887
Journals	995
Total	1,862
Pages Xeroxed	10,608
Bibliographies	211
Acquisitions	
Bound journals	415
Books added	992
Total	1,407
Volumes withdrawn (Books)	366
Previous total volumes in collection	93,077
Total volumes in collection	94,118

MARYLAND MEDICAL POLITICAL ACTION COMMITTEE

Mr. President and Members of the House of Delegates:

As Chairman of the Maryland Medical Political Action Committee I would like to first of all express my thanks to the Medical and Chirurgical Faculty for its great cooperation since this organization really got under way in 1962.

We owe particular thanks to Mr. Sargeant and his staff who have helped us so much with the administration and billing and all the details of interviewing candidates. We are indebted to Dr. Mech and the Executive Committee for approval of the joint billing in which your bill for dues of Maryland Medical Political Action Committee and AMPAC, our parent organization, are included on the same billhead as Med-Chi dues. This has obviously been a great boon to our membership. As is inevitable, a few physicians

have paid their dues without realizing the inclusion. After talking with them, most agree this is a good thing to do. I'd like to convince the leaders of medicine in this community—namely yourselves—to become interested in MMPAC and with this in mind, I would like to take a second to give you some background.

The American Medical Political Action Committee is here to stay. It is the fourth largest political action movement in the country, being next to the National Democratic and Republican Parties and COPE, labor's political arm.

Our own state organization started with a few members in 1962. We are now ranked about 20th in size in the country. We provided the margin of victory for Larry Hogan in the 5th District two years ago when we evened up our state delegation to Congress—four Democrats and four Republicans. We provided significant support to Gilbert Gude and J. Glenn Beall, and we have provided support for other candidates. We have tried desperately to maintain our bipartisan posture. We interview all candidates. We judge the candidates only on their ability to serve in a fair and honest fashion, and we are interested, obviously, in their willingness to communicate with us on medical issues.

I think Dr. Fisher brought it into focus that if we don't elect people to Congress who are willing to engage in free and open communication with the medical community, we will be in serious trouble, and there's no doubt that coordinated, meaningful candidate support and money coming from a central group is much more effective than each individual supporting his own candidate. Certainly we want everyone to get behind his own individual candidate, but it is more meaningful to have group and financial support, and I can tell you that all the candidates who ran two years ago, as well as those who are getting ready to run this time, are very aware of this fact.

Our other goal, of course, is political education and in this regard we send out a regular newsletter so that we, as physicians, can be informed about the candidates and the issues coming up. We are indebted to Mrs. Karl Mech who has done such a wonderful job with our newsletter over the past years.

At our national workshop, which was held in Washington three weeks ago, almost everyone who is knowledgeable in predicting the political future was convinced that some sort of National Health Insurance Program will come before Congress in the next two years in some form or other. This should be enough of an impetus to get us into the game.

We have district chairmen in every congressional district. We can provide you with their names. If you want to contribute or ask your wife to contribute time to candidate support, we have the organization to do this and you can do it through your own Board of Directors and men working in your own Congressional district. We ask you to please do so.

I must repeat one remark Mr. Scammon, who is an astute political observer, made in his closing statements in Washington recently. He said: "I don't like to agree with Mr. Buckley, but I thought his definition of Democracy was the best I ever heard. This was that he would rather be ruled by the first two thousand names in the Boston phone book than the entire Harvard Faculty." I think we better start going through our phone book and find support and elect candidates who can effectively represent us in the halls of Congress. If we don't, you can be sure no one will do it for us.

Respectfully submitted,

GEORGE G. FINNEY, JR., MD, *Chairman*

MARYLAND MEDICAL SERVICE, INC. BOARD OF DIRECTORS

Mr. President and Members of the House of Delegates:

Maryland Blue Shield continued its established pattern of growth and progress in 1969. Enrollment continued to increase; the number of claims processed rose sharply; subscription income was substantially greater than in 1968, with a corresponding increase in benefits paid; phasing down of Plan A enrollment, and acceleration of enrollment in Plan C continued; the number of participating physicians again increased; and further administrative improvements were effected.

Plan membership at year's end was 1,159,177, an increase of 62,132 (5.6%) over 1968. Though the National Association of Blue Shield Plans has not yet published year-end figures, their report for the first nine months records an average percent of growth of 3.36% for all 73 U. S. Plans. The Maryland Plan did substantially better than the average, having increased its enrollment by 4.85% in the first nine months. At the end of the year, Blue Shield membership had reached 88% of that of our companion Blue Cross Plan, compared with 86% the previous year.

The overall growth in enrollment was characterized, as planned, by a substantial gain in Plan C and continuing growth in Plan B, while Plan A showed a significant decline. At the end of 1969, Plan A accounted for only 8.8% of total enrollments, compared with 10.8% a year earlier. Plan C enrollment was increased by 90,000 to a total of 330,000 during the year; at year's end it accounted for 28% of total Blue Shield membership.

The number, as well as the total monetary amount of claims paid during the year, showed a sharp increase. Payment was made for 973,050 separate services, an increase of more than 60% over the 606,359 paid in the previous year. The total dollar amount paid in 1969 was $24.7 million, and in 1968, $18.7 million. The increase in Plan enrollment, particularly under Plans B and C referred to above, accounts for some of this difference; a larger part, however, results from the popularity of the diagnostic endorsements, which heavily increase both the number and the total value of claims.

Maryland Blue Shield's activity as the intermediary in Maryland for federal government programs showed an increase also. The number of Part B Medicare claims processed increased by 9.9%, from about 358,000 in 1968 to nearly 394,000 in 1969. The amount paid increased by 13%, from less than $11 million in 1968 to $12.3 million in 1969. Most Faculty members will recall that Part B Medicare payments were limited by the Social Security Administration to the levels being paid as of December 31, 1968. This limitation continued throughout the year and, in addition, more specific instructions were issued by SSA as to the statistical methods to be employed in determining usual charges and prevailing fee ranges.

Maryland Blue Shield, in 1969, increased its activities in utilization review, formally established a separate department devoted exclusively to that activity. This activity, involving review of individual physician's claims records, is designed to ensure the most economical and effective use of covered services under both Medicare B and our own underwritten programs, for the mutual benefit of physicians and the entire community.

The number of Maryland physicians who have agreed to participate in Maryland Blue Shield increased from 3,765 as of December 31, 1968, to 3,858 as of December 31, 1969, or more than 90% of the physicians in private practice in the state. Professional Relations representatives of Maryland Blue Shield made 3,916 visits to physician's offices, and participated in 13 meetings of physicians or physicians' staff or clerical personnel.

Finally, consistent with the revised operating agreement negotiated with Maryland Blue Cross in 1968, as of January 1, 1969, all employees engaged solely in Blue Shield work became employees of Blue Shield. And, to better identify the Plan in the community, its corporate name was officially changed to Maryland Blue Shield, Inc., on January 1, 1970.

Respectfully submitted,
J. Sheldon Eastland, MD, *Chairman*

MARYLAND STATE MEDICAL JOURNAL

Mr. President and Members of the House of Delegates:

On January 26, 1970, the Editorial Board met to discuss various aspects of Journal operation including local advertising in view of cost versus income, publishing on a ten- or eleven-month basis rather than twelve months, special issues, supply of manuscripts and transcripts, printers' bids, Journal format in regard to cost and effectiveness, scheduling regular meetings of the Board, and the Membership Directory in regard to cost versus value, annual or biennual publication, format, and information it should contain.

Since the Journal is in financial difficulty, it was previously decided by the Executive Secretary, the Comptroller, and the Managing Editor to contact another advertising agency which would be willing to take less than 45% of the local advertising income—the rate of commission at which we are now under contract to provide to the present agency—and which would be more responsible in contacting prospective advertisers with regard to Journal policy established by the Council, and with regard to a generally more attractive appearance of the local advertising. Mr. Paul Moore of the Ruehl and Co., Inc., advertising and public relations firm, was contacted and has agreed to accept the job of selling and preparing the advertising on a 25% commission.

Mr. Moore appeared before the Board and presented his proposal which was favorably accepted. Dr. Flotte made a motion to recommend a change in advertising agency to the Executive Committee at its meeting on February 12. Dr. Lisansky seconded the motion.

The Executive Committee accepted the recommendation and agreed to bring it before Council on March 19, 1970. Council subsequently approved the measure and Mrs. Sally Ladin Ogden, our present advertising agent, has been informed of the termination of the contract as of the last day of September 1970 according to the terms of the agreement drawn up in 1962.

The suggestion of reducing the number of Journal issues was also taken before the Executive Committee and was rejected as not practical.

The Editorial Board agreed that the Journal should continue its special issues and the grouping of independent manuscripts to form such issues when feasible. It was also decided that transcripts would no longer be requested or accepted since the supply of prepared manuscripts is more than sufficient.
